**Description**

These devices are designed to limit overvoltages on the telephone line. Overvoltages are normally caused by a.c. power system or lightning flash disturbances which are induced or conducted on to the telephone line. A single device provides 2-point protection and is typically used for the protection of 2-wire telecommunication equipment (e.g. between the Ring and Tip wires for telephones and modems). Combinations of devices can be used for multi-point protection (e.g. 3-point protection between Ring, Tip and Ground).

The protector consists of a symmetrical voltage-triggered bidirectional thyristor. Overvoltages are initially clipped by breakdown clamping until the voltage rises to the breakover level, which causes the device to crowbar into a low-voltage on state. This low-voltage on state causes the current resulting from the overvoltage to be safely diverted through the device. The high crowbar holding current helps prevent d.c. latchup as the diverted current subsides.

**How To Order**

| Device       | Package                  | Carrier              | Order As        |
|--------------|--------------------------|----------------------|-----------------|
| TISP4xxxM3BJ | BJ (J-Bend DO-214AA/SMB) | Embossed Tape Reeled | TISP4xxxM3BJR-S |

Insert xxx value corresponding to protection voltages of 070, 080, 095, 115, etc.

\*RoHS Directive 2002/95/EC Jan 27 2003 including Annex  
NOVEMBER 1997 - REVISED MAY 2007  
Specifications are subject to change without notice.  
Customers should verify actual device performance in their specific applications.

# TISP4xxxM3BJ Overvoltage Protector Series

**BOURNS®**

## Description (continued)

The TISP4xxxM3BJ range consists of nineteen voltage variants to meet various maximum system voltage levels (58 V to 320 V). They are guaranteed to voltage limit and withstand the listed international lightning surges in both polarities. These medium (M) current protection devices are in a plastic package SMBJ (JEDEC DO-214AA with J-bend leads) and supplied in embossed tape reel pack. For alternative voltage and holding current values, consult the factory. For higher rated impulse currents in the SMB package, the 100 A 10/1000 TISP4xxxH3BJ series is available.

## Absolute Maximum Ratings, $T_A = 25\text{ }^\circ\text{C}$ (Unless Otherwise Noted)

| Rating   | Symbol    | Value  | Unit                         |   |
|--|-----------|--|------------------------------|---|
| Repetitive peak off-state voltage, (see Note 1)  | '4070     | ± 58   | V                            |   |

- NOTES: 1. See Applications Information and Figure 11 for voltage values at lower temperatures.  
 2. Initially, the TISP4xxxM3BJ must be in thermal equilibrium with  $T_J = 25\text{ }^\circ\text{C}$ .  
 3. The surge may be repeated after the TISP4xxxM3BJ returns to its initial conditions.  
 4. See Applications Information and Figure 12 for current ratings at other temperatures.  
 5. EIA/JESD51-2 environment and EIA/JESD51-3 PCB with standard footprint dimensions connected with 5 A rated printed wiring track widths. See Figure 9 for the current ratings at other durations. Derate current values at  $-0.61\text{ }^\circ\text{C}$  for ambient temperatures above  $25\text{ }^\circ\text{C}$ .

## APPLICATIONS INFORMATION

### Deployment

These devices are two terminal overvoltage protectors. They may be used either singly to limit the voltage between two conductors (Figure 13) or in multiples to limit the voltage at several points in a circuit (Figure 14).

Figure 13. Two Point Protection

Figure 14. Multi-Point Protection

In Figure 13, protector Th1 limits the maximum voltage between the two conductors to  $\pm V_{(BO)}$ . This configuration is normally used to protect circuits without a ground reference, such as modems. In Figure 14, protectors Th2 and Th3 limit the maximum voltage between each conductor and ground to the  $\pm V_{(BO)}$  of the individual protector. Protector Th1 limits the maximum voltage between the two conductors to its  $\pm V_{(BO)}$  value. If the equipment being protected has all its vulnerable components connected between the conductors and ground, then protector Th1 is not required.

### Impulse Testing

To verify the withstand capability and safety of the equipment, standards require that the equipment is tested with various impulse wave forms. The table below shows some common values.

† FCC Part 68 terminology for the waveforms produced by the ITU-T recommendation K.21 10/700 impulse generator

If the impulse generator current exceeds the protector's current rating, then a series resistance can be used to reduce the current to the protector's rated value to prevent possible failure. The required value of series resistance for a given waveform is given by the following calculations. First, the minimum total circuit impedance is found by dividing the impulse generator's peak voltage by the protector's rated current. The impulse generator's fictive impedance (generator's peak voltage divided by peak short circuit current) is then subtracted from the minimum total circuit impedance to give the required value of series resistance.

For the FCC Part 68 10/560 waveform, the following values result. The minimum total circuit impedance is  $800/75 = 10.7 \Omega$  and the generator's fictive impedance is  $800/100 = 8 \Omega$ . This gives a minimum series resistance value of  $10.7 - 8 = 2.7 \Omega$ . After allowing for tolerance, a  $3 \Omega \pm 10\%$  resistor would be suitable. The 10/160 waveform needs a standard resistor value of 5.6  $\Omega$  per conductor. These would be R1a and R1b in Figure 16 and Figure 17. FCC Part 68 allows the equipment to be non-operational after the 10/160 (conductor to ground) and 10/560 (inter-conductor) impulses. The series resistor value may be reduced to zero to pass FCC Part 68 in a non-operational mode, e.g. Figure 15. For this type of design, the series fuse must open before the TISP4xxxM3 fails. For Figure 15, the maximum fuse  $i^2t$  is  $2.3 A^2s$ . In some cases, the equipment will require verification over a temperature range. By using the rated waveform values from Figure 12, the appropriate series resistor value can be calculated for ambient temperatures in the range of  $-40 \text{ }^\circ\text{C}$  to  $85 \text{ }^\circ\text{C}$ .

## AC Power Testing

The protector can withstand currents applied for times not exceeding those shown in Figure 9. Currents that exceed these times must be terminated or reduced to avoid protector failure. Fuses, PTC (Positive Temperature Coefficient) thermistors and fusible resistors are overcurrent protection devices which can be used to reduce the current flow. Protective fuses may range from a few hundred milliamperes to one ampere. In some cases, it may be necessary to add some extra series resistance to prevent the fuse opening during impulse testing. The current versus time characteristic of the overcurrent protector must be below the line shown in Figure 9. In some cases, there may be a further time limit imposed by the test standard (e.g. UL 1459 wiring simulator failure).

## Capacitance

The protector characteristic off-state capacitance values are given for d.c. bias voltage,  $V_D$ , values of 0, -1 V, -2 V and -50 V. Where possible values are also given for -100 V. Values for other voltages may be calculated by multiplying the  $V_D = 0$  capacitance value by the factor given in Figure 6. Up to 10 MHz, the capacitance is essentially independent of frequency. Above 10 MHz, the effective capacitance is strongly dependent on connection inductance. In many applications, such as Figure 16 and Figure 18, the typical conductor bias voltages will be about -2 V and -50 V. Figure 7 shows the differential (line unbalance) capacitance caused by biasing one protector at -2 V and the other at -50 V.

Figure 8 shows the typical capacitance asymmetry; the difference between the capacitance measured with a positive value of  $V_D$  and the capacitance value when the polarity of  $V_D$  is reversed. Capacitance asymmetry is an important parameter in ADSL systems where the protector often has no d.c. bias and the signal level is in the region of  $\pm 10$  V.

## Normal System Voltage Levels

The protector should not clip or limit the voltages that occur in normal system operation. For unusual conditions, such as ringing without the line connected, some degree of clipping is permissible. Under this condition, about 10 V of clipping is normally possible without activating the ring trip circuit.

Figure 11 allows the calculation of the protector  $V_{DRM}$  value at temperatures below 25 °C. The calculated value should not be less than the maximum normal system voltages. The TISP4265M3BJ, with a  $V_{DRM}$  of 200 V, can be used for the protection of ring generators producing 100 V rms of ring on a battery voltage of -58 V (Th2 and Th3 in Figure 18). The peak ring voltage will be  $58 + 1.414 \times 100 = 199.4$  V. However, this is the open circuit voltage and the connection of the line and its equipment will reduce the peak voltage. In the extreme case of an unconnected line, clipping the peak voltage to 190 V should not activate the ring trip. This level of clipping would occur at the temperature when the  $V_{DRM}$  has reduced to  $190/200 = 0.95$  of its 25 °C value. Figure 11 shows that this condition will occur at an ambient temperature of -28 °C. In this example, the TISP4265M3BJ will allow normal equipment operation provided that the minimum expected ambient temperature does not fall below -28 °C.

## JESD51 Thermal Measurement Method

To standardize thermal measurements, the EIA (Electronic Industries Alliance) has created the JESD51 standard. Part 2 of the standard (JESD51-2, 1995) describes the test environment. This is a 0.0283 m<sup>3</sup> (1 ft<sup>3</sup>) cube which contains the test PCB (Printed Circuit Board) horizontally mounted at the center. Part 3 of the standard (JESD51-3, 1996) defines two test PCBs for surface mount components; one for packages smaller than 27 mm on a side and the other for packages up to 48 mm. The SMBJ measurements used the smaller 76.2 mm x 114.3 mm (3.0 " x 4.5 ") PCB. The JESD51-3 PCBs are designed to have low effective thermal conductivity (high thermal resistance) and represent a worst case condition. The PCBs used in the majority of applications will achieve lower values of thermal resistance, and can dissipate higher power levels than indicated by the JESD51 values.

## Device Symbolization Code

Devices will be coded as below. As the device parameters are symmetrical, terminal 1 is not identified.

| Device       | Symbolization Code |
|--------------|--------------------|
| TISP4070M3BJ | 4070M3             |
| TISP4080M3BJ | 4080M3             |
| TISP4095M3BJ | 4095M3             |
| TISP4115M3BJ | 4115M3             |
| TISP4125M3BJ | 4125M3             |
| TISP4145M3BJ | 4145M3             |
| TISP4165M3BJ | 4165M3             |
| TISP4180M3BJ | 4180M3             |
| TISP4200M3BJ | 4200M3             |
| TISP4220M3BJ | 4220M3             |
| TISP4240M3BJ | 4240M3             |
| TISP4250M3BJ | 4250M3             |
| TISP4265M3BJ | 4265M3             |
| TISP4290M3BJ | 4290M3             |
| TISP4300M3BJ | 4300M3             |
| TISP4350M3BJ | 4350M3             |
| TISP4360M3BJ | 4360M3             |
| TISP4395M3BJ | 4395M3             |
| TISP4400M3BJ | 4400M3             |

NOVEMBER 1997 - REVISED MAY 2007  
Specifications are subject to change without notice.  
Customers should verify actual device performance in their specific applications.

Компания «Life Electronics» занимается поставками электронных компонентов импортного и отечественного производства от производителей и со складов крупных дистрибьюторов Европы, Америки и Азии.

С конца 2013 года компания активно расширяет линейку поставок компонентов по направлению коаксиальный кабель, кварцевые генераторы и конденсаторы (керамические, пленочные, электролитические), за счёт заключения дистрибьюторских договоров

Мы предлагаем:

- Конкурентоспособные цены и скидки постоянным клиентам.
- Специальные условия для постоянных клиентов.
- Подбор аналогов.
- Поставку компонентов в любых объемах, удовлетворяющих вашим потребностям.
- Приемлемые сроки поставки, возможна ускоренная поставка.
- Доставку товара в любую точку России и стран СНГ.
- Комплексную поставку.
- Работу по проектам и поставку образцов.
- Формирование склада под заказчика.
- Сертификаты соответствия на поставляемую продукцию (по желанию клиента).
- Тестирование поставляемой продукции.
- Поставку компонентов, требующих военную и космическую приемку.
- Входной контроль качества.
- Наличие сертификата ISO.

В составе нашей компании организован Конструкторский отдел, призванный помогать разработчикам, и инженерам.

Конструкторский отдел помогает осуществить:

- Регистрацию проекта у производителя компонентов.
- Техническую поддержку проекта.
- Защиту от снятия компонента с производства.
- Оценку стоимости проекта по компонентам.
- Изготовление тестовой платы монтаж и пусконаладочные работы.
