## QorIQ LS1088A Data Sheet

### Features

- LS1088A contains eight ARM® Cortex®-A53 (32/64 bit) cores with the following capabilities:
  - Speed up to 1.6 GHz
  - Arranged as two clusters of four cores
  - 32 KB L1 instruction cache (ECC protection) and 32 KB L1 data cache (ECC protection)
  - Two 1 MB unified I/D L2 cache (ECC protection), one per Cortex-A53 core cluster
  - NEON™ SIMD coprocessor
  - ARMv8 cryptography extensions
- Hierarchical interconnect fabric:
  - Hardware-managed data coherency
  - Up to 700 MHz operation
- One 32/64-bit DDR4 SDRAM memory controller:
  - ECC and interleaving support
  - Up to 2.1 GT/s
- Datapath acceleration architecture 2.0 (DPAA2) incorporates acceleration for the following functions:
  - Packet parsing, classification, and distribution (WRIOP)
  - Queue management for scheduling, packet sequencing, and congestion management (QMan)
  - Hardware buffer management for buffer allocation and de-allocation (BMan)
  - Cryptography acceleration (SEC)
  - IEEE 1588 support
  - Advanced I/O processor (AIOP)
- Parallel Ethernet interfaces:
  - Up to two RGMII interfaces
- Eight SerDes lanes for high-speed peripheral interfaces:
  - Three PCI Express 3.0 controllers (one supporting x4 operation)
  - One serial ATA (SATA 3.0) controller supporting 6 Gbps
  - Up to two SGMII supporting 2500 Mbps
  - Up to four SGMII supporting 1000 Mbps
  - Up to two XFI (10 GbE) interfaces
  - Up to two QSGMII
  - Supports 1000Base-KX
  - Supports 10GBase-KR
- Additional peripheral interfaces include:
  - One quad serial peripheral interface (QSPI) controller, one serial peripheral interface (SPI) controller
  - Integrated flash controller (IFC) supporting NAND and NOR flash with 28-bit addressing and 16-bit data
  - Two USB 3.0 controllers with integrated PHY
  - Enhanced secure digital host controller supporting SD 3.0, eMMC 4.4, and eMMC 4.5 modes
  - uQE supporting TDM/HDLC
  - Four I2C controllers
  - Two 16550-compliant UARTs
  - General purpose IO (GPIO), four FlexTimers, and nine watchdog timers
  - Trust architecture
  - Debug support with run control, data acquisition, high-speed trace, and performance/event monitoring
- 780 FC-PBGA package, 23 mm x 23 mm, 0.8 mm pitch

# 1 Overview

A member of the Layerscape (LS1) series, the LS1088A is a cost-effective, power-efficient, and highly integrated system-on-chip (SoC) device featuring eight extremely power-efficient 64-bit ARM® Cortex®-A53 cores with ECC-protected L1 and L2 cache memories for high reliability, running up to 1.6 GHz.

The LS1088A family of devices can be used for enterprise and service provider routers, Virtual CPE, industrial communications, security appliance and military and aerospace applications.

This figure shows the LS1088A block diagram.

1. Functionally, this pin is an output or an input, but structurally it is an I/O because it either samples configuration input during reset, is a muxed pin, or has other manufacturing test functions. Therefore, this pin is described as an I/O for boundary scan.
2. This output is actively driven during reset rather than being tri-stated during reset.
3. MDIC[0] is grounded through a 162  $\Omega$  precision 1% resistor and MDIC[1] is connected to  $GV_{DD}$  through a 162  $\Omega$  precision 1% resistor. For either full or half driver strength calibration of DDR I/Os, use the same MDIC resistor value of 162  $\Omega$ . The memory controller register setting can be used to determine automatic calibration is done to full or half drive strength. These pins are used for automatic calibration of the DDR4 I/Os.

4. This pin is a reset configuration pin. It has a weak ( $\sim 20\text{ k}\Omega$ ) internal pull-up P-FET that is enabled only when the processor is in its reset state. This pull-up is designed such that it can be overpowered by an external  $4.7\text{ k}\Omega$  resistor. However, if the signal is intended to be high after reset, and if there is any device on the net that might pull down the value of the net at reset, a pull-up or active driver is needed.
5. Pin must **NOT** be pulled down during power-on reset. This pin may be pulled up, driven high, or, if there are any externally connected devices, left in tristate. If this pin is connected to a device that pulls down during reset, an external pull-up is required to drive this pin to a safe state during reset.
6. Recommend that a weak pull-up resistor ( $2\text{--}10\text{ k}\Omega$ ) be placed on this pin to the respective power supply.
7. This pin is an open-drain signal.
8. Recommend that a pull-up resistor ( $1\text{ k}\Omega$ ) be placed on this pin to the respective power supply.
9. This pin has a weak ( $\sim 20\text{ k}\Omega$ ) internal pull-up P-FET that is always enabled.
10. These are test signals for factory use only and must be pulled up ( $100\text{ }\Omega$  to  $1\text{ k}\Omega$ ) to the respective power supply for normal operation.
11. This pin requires a  $200\text{ }\Omega$  pull-up to the respective power supply.
12. Do not connect. These pins should be left floating.
13. These pins must be pulled up to  $\text{TV}_{\text{DD}}$  through a  $180\text{ }\Omega \pm 1\%$  resistor for MDC and a  $330\text{ }\Omega \pm 1\%$  resistor for MDIO.
14. This pin requires an external  $1\text{ k}\Omega$  pull-down resistor to prevent PHY from seeing a valid Transmit Enable before it is actively driven.
15. These pins must be pulled to ground (GND).
16. This pin requires a  $698\text{ }\Omega$  pull-up to the respective power supply.
17. These pins should be tied to ground if the diode is not utilized for temperature monitoring.
18. SD\_GND must be directly connected to GND.
19. For proper clock selection, terminate `cfg_eng_use0` with a pull up or pull down of  $4.7\text{ k}\Omega$  to ensure that the signal will have a valid state as soon as the IO voltage reaches its operating condition.

20. DIFF\_SYSCLK and DIFF\_SYSCLK\_B is tied to cfg\_eng\_use0, the configuration is described in section "Reset Configuration Word (RCW)" of *QorIQ LS1088A Reference Manual*.

### Warning

See "**Connection Recommendations**" for additional details on properly connecting these pins for specific applications.

## 3 Electrical characteristics

This section describes the DC and AC electrical specifications for the chip. The chip is currently targeted to these specifications, some of which are independent of the I/O cell but are included for a more complete reference. These are not purely I/O buffer design specifications.

### 3.1 Overall DC electrical characteristics

This section describes the ratings, conditions, and other characteristics.

**Notes:**

- Functional operating conditions are given in [Table 3](#). Absolute maximum ratings are stress ratings only, and functional operation at the maximums is not guaranteed. Stresses beyond those listed may affect device reliability or cause permanent damage to the device.
- Caution:** MV<sub>IN</sub> must not exceed GV<sub>DD</sub> by more than 0.3 V. This limit may be exceeded for a maximum of 20 ms during power-on reset and power-down sequences.
- Caution:** OV<sub>IN</sub> must not exceed OV<sub>DD</sub> by more than 0.3 V. This limit may be exceeded for a maximum of 20 ms during power-on reset and power-down sequences.
- Caution:** LV<sub>IN</sub> must not exceed LV<sub>DD</sub> by more than 0.3 V. This limit may be exceeded for a maximum of 20 ms during power-on reset and power-down sequences.
- (D, G1, L, O, X, S, T, E)V<sub>IN</sub> and USBn\_HV<sub>IN</sub> may overshoot/undershoot to a voltage and for a maximum duration as shown in [Figure 7](#).
- Caution:** DV<sub>IN</sub> must not exceed DV<sub>DD</sub> by more than 0.3 V. This limit may be exceeded for a maximum of 20 ms during power-on reset and power-down sequences.
- Caution:** EV<sub>IN</sub> must not exceed EV<sub>DD</sub> by more than 0.3 V. This limit may be exceeded for a maximum of 20 ms during power-on reset and power-down sequences.
- Supply voltage specified at the voltage sense pin. Voltage input pins should be regulated to provide specified voltage at the sense pin.
- See the power supply column to determine which power supply rail is used for each interface.
- Transceiver supply for USB PHY.
- Analog and Digital SS supply for USB PHY.
- Analog and Digital HS supply for USB PHY.
- Caution:** TV<sub>IN</sub> must not exceed TV<sub>DD</sub> by more than 0.3 V. This limit may be exceeded for a maximum of 20 ms during power-on reset and power-down sequences.

**Notes:**

1. RGMII is supported at 2.5 V or 1.8 V.
2. TA\_PROG\_SFP must be supplied 1.8 V and the chip must operate in the specified fuse programming temperature range only during secure boot fuse programming, subject to the power sequencing constraints shown in [Power sequencing](#). For all other operating conditions, TA\_PROG\_SFP must be tied to GND.
3. For additional information, see the Core and platform supply voltage filtering section in the chip design checklist.

**Table 3. Recommended operating conditions**

This figure shows the undershoot and overshoot voltages at the interfaces of the chip.

**Notes:**

The overshoot/undershoot period should be less than 10% of shortest possible toggling period of the input signal or per input signal specific protocol requirement. For GPIO input signal overshoot/undershoot period, it should be less than 10% of the SYSCLK period.

**Figure 7. Overshoot/Undershoot voltage for G1V<sub>DD</sub>/OV<sub>DD</sub>/S1V<sub>DD</sub>/DV<sub>DD</sub>/TV<sub>DD</sub>/ LV<sub>DD</sub>/EV<sub>DD</sub>/ USB\*V<sub>DD</sub>**

See [Table 3](#) for actual recommended core voltage. Voltage to the processor interface I/Os are provided through separate sets of supply pins and must be provided at the voltages shown in [Table 3](#). The input voltage threshold scales with respect to the associated I/O supply voltage. DVDD-, OVDD-, and LVDD-based receivers are simple CMOS I/O circuits and satisfy appropriate LVCMOS type specifications. The DDR SDRAM

interface uses differential receivers referenced by the internally generated MVREF signal. The DDR DQS receivers cannot be operated in single-ended fashion. The complement signal must be properly driven and cannot be grounded.

### 3.1.3 Output driver characteristics

This chip provides information on the characteristics of the output driver strengths.

#### NOTE

These values are preliminary estimates.

## 3.2 General AC timing specifications

This table provides AC timing specifications for the sections not covered under the specific interface sections.

**Table 5. AC Timing specifications**

Parameter	Symbol	Min	Max	Unit	Notes
Input signal rise and fall times	$t_R/t_F$	-	5	ns	1
1. Rise time refers to signal transitions from 10% to 90% of Supply; fall time refers to transitions from 90% to 10% of supply					

## 3.3 Power sequencing

The chip requires that its power rails be applied in a specific sequence in order to ensure proper device operation. For power up, these requirements are as follows:

1.  $AV_{DD\_SDn\_PLL1}$ ,  $AV_{DD\_SDn\_PLL2}$ ,  $EV_{DD}$ ,  $DV_{DD}$ ,  $LV_{DD}$ ,  $OV_{DD}$ ,  $SV_{DD}$ ,  $TV_{DD}$ ,  $XV_{DD}$ ,  $USB\_HV_{DD}$ ,  $USB\_SDV_{DD}$ ,  $USB\_SV_{DD}$ . Drive  $TA\_PROG\_SFP = GND$ .
  - $PORESET\_B$  input must be driven asserted and held during this step.
2.  $V_{DD}$ .
3.  $G1V_{DD}$ .

Items on the same line have no ordering requirement with respect to one another. Items on separate lines must be ordered sequentially such that voltage rails on a previous step must reach 90% of their value before the voltage rails on the current step reach 10% of their value.  $XV_{DD}$ ,  $AV_{DD\_SDn\_PLL1}$ , and  $AV_{DD\_SDn\_PLL2}$  have no ordering requirement to any other supplies, and they can ramp up in any step.  $SV_{DD}$  should ramp up before  $V_{DD}$ . Alternatively,  $V_{DD}$  may ramp up together with  $SV_{DD}$  provided that the relative timing between  $SV_{DD}$  and  $V_{DD}$  ramp up conforms to [Figure 8](#) below.

All supplies must be at their stable values within 400 ms.

Negate  $PORESET\_B$  input when the required assertion/hold time has been met per [RESET initialization timing specifications](#).

### NOTE

- While  $V_{DD}$  is ramping up, leakage current might occur from  $V_{DD}$  through LS1088A to  $G1V_{DD}$ .
- Ensure that  $SYSCLK$  is available as soon as power ramps up.
- Ramp rate requirements should be met per [Table 11](#).

**NOTE**

If using Trust Architecture Security Monity battery backed features, prior to  $V_{DD}$  or  $SV_{DD}$  ramping up to 0.5 V level, ensure that  $OV_{DD}$  is properly ramped to at least 90% and  $SYSCLK$  or  $DIFF\_SYSCLK / DIFF\_SYSCLK\_B$  is running. The clock should have a minimum frequency of 800 Hz and a maximum frequency no greater than the supported system clock frequency for the device.

**Warning**

Only 300,000 POR cycles are permitted per lifetime of a device. Note that this value is based on design estimates and is preliminary.

This figure shows the  $SV_{DD}$  and  $V_{DD}$  ramp-up diagram.

**Figure 8.  $SV_{DD}$  and  $V_{DD}$  ramp-up diagram**

For secure boot fuse programming, use the following steps:

1. After negation of  $PORESET\_B$ , drive  $TA\_PROG\_SFP = 1.80$  V after a required minimum delay per [Table 6](#).

- After fuse programming is completed, it is required to return TA\_PROG\_SFP = GND before the system is power cycled (PORESET\_B assertion) or powered down ( $V_{DD}$  ramp down) per the required timing specified in Table 6. See [Security fuse processor](#) for additional details.

### Warning

No activity other than that required for secure boot fuse programming is permitted while TA\_PROG\_SFP is driven to any voltage above GND, including the reading of the fuse block. The reading of the fuse block may only occur while TA\_PROG\_SFP = GND.

This figure shows the TA\_PROG\_SFP timing diagram.

NOTE: TA\_PROG\_SFP must be stable at 1.8 V prior to initiating fuse programming.

**Figure 9. TA\_PROG\_SFP timing diagram**

This table provides information on the power-down and power-up sequence parameters for TA\_PROG\_SFP.

**Table 6. TA\_PROG\_SFP timing <sup>5</sup>**

Driver type	Min	Max	Unit	Notes
t <sub>TA_PROG_SFP_DELAY</sub>	100	—	SYSCLKs	1
t <sub>TA_PROG_SFP_PROG</sub>	0	—	us	2
t <sub>TA_PROG_SFP_VDD</sub>	0	—	us	3
t <sub>TA_PROG_SFP_RST</sub>	0	—	us	4

**Notes:**

- Delay required from the deassertion of PORESET\_B to driving TA\_PROG\_SFP ramp up. Delay measured from PORESET\_B deassertion at 90% OV<sub>DD</sub> to 10% TA\_PROG\_SFP ramp up.
- Delay required from fuse programming completion to TA\_PROG\_SFP ramp down start. Fuse programming must complete while TA\_PROG\_SFP is stable at 1.8 V. No activity other than that required for secure boot fuse programming is permitted while TA\_PROG\_SFP is driven to any voltage above GND, including the reading of the fuse block. The reading of the fuse block may only occur while TA\_PROG\_SFP = GND. After fuse programming is complete, it is required to return TA\_PROG\_SFP = GND.

**Table 6. TA\_PROG\_SFP timing <sup>5</sup>**

Driver type	Min	Max	Unit	Notes
3. Delay required from TA_PROG_SFP ramp-down complete to V <sub>DD</sub> ramp-down start. TA_PROG_SFP must be grounded to minimum 10% TA_PROG_SFP before V <sub>DD</sub> reaches 90% V <sub>DD</sub> .				
4. Delay required from TA_PROG_SFP ramp-down complete to PORESET_B assertion. TA_PROG_SFP must be grounded to minimum 10% TA_PROG_SFP before PORESET_B assertion reaches 90% OV <sub>DD</sub> .				
5. Only two secure boot fuse programming events are permitted per lifetime of a device.				

### 3.4 Power-down requirements

The power-down cycle must complete such that power supply values are below 0.4 V before a new power-up cycle can be started.

If performing secure boot fuse programming per the requirements in [Power sequencing](#), it is required that TA\_PROG\_SFP = GND before the system is power cycled (PORESET\_B assertion) or powered down (V<sub>DD</sub> ramp down) per the required timing specified in [Power sequencing](#).

### 3.5 Power characteristics

## 3.6 Power-on ramp rate

This section describes the AC electrical specifications for the power-on ramp rate requirements. Controlling the maximum power-on ramp rate is required to avoid excess in-rush current.

This table provides the power supply ramp rate specifications.

**Table 11. Power supply ramp rate**

Parameter	Min	Max	Unit	Notes
Required ramp rate for all voltage supplies (including OV <sub>DD</sub> /DV <sub>DD</sub> /G1V <sub>DD</sub> /SV <sub>DD</sub> /XV <sub>DD</sub> /LV <sub>DD</sub> /EV <sub>DD</sub> /TV <sub>DD</sub> all core and platform V <sub>DD</sub> supplies, TA_PROG_SFP, and all AV <sub>DD</sub> supplies.)	—	25	V/ms	1, 2
Required ramp rate for PROG_SFP	---	25	V/ms	1,2
Required ramp rate for USB_HVDD	---	26.7	V/ms	1,2
<b>Notes:</b> 1. Ramp rate is specified as a linear ramp from 10% to 90%. If non-linear (for example, exponential), the maximum rate of change from 200 mV to 500 mV is the most critical as this range might falsely trigger the ESD circuitry. 2. Over full recommended operating temperature range. See <a href="#">Table 3</a> .				

## 3.7 Input clocks

### 3.7.1 System clock (SYSCLK)

This section describes the system clock DC electrical characteristics and AC timing specifications.

### 3.7.1.1 SYCLK DC electrical characteristics

This table provides the SYCLK DC characteristics.

**Table 12. SYCLK DC electrical characteristics**

Parameter	Symbol	Min	Typical	Max	Unit	Notes
Input high voltage	$V_{IH}$	$0.7 \times OV_{DD}$	—	—	V	1
Input low voltage	$V_{IL}$	—	—	$0.3 \times OV_{DD}$	V	1
Input capacitance	$C_{IN}$	—	7	12	pF	—
Input current ( $V_{IN} = 0$ V or $V_{IN} = OV_{DD}$ )	$I_{IN}$	—	—	$\pm 50$	$\mu$ A	2
<b>Notes:</b> 1. The min $V_{IL}$ and max $V_{IH}$ values are based on the respective min and max $OV_{IN}$ values found in <a href="#">Table 3</a> . 2. At recommended operating conditions with $OV_{DD} = 1.8$ V. See <a href="#">Table 3</a> .						

### 3.7.1.2 SYCLK AC timing specifications

This table provides the SYCLK AC timing specifications.

**Table 13. SYCLK AC timing specifications<sup>1, 5</sup>**

Parameter/condition	Symbol	Min	Typ	Max	Unit	Notes
SYCLK frequency	$f_{SYCLK}$	100.0	—	125/133.3	MHz	2, 6
SYCLK cycle time	$t_{SYCLK}$	7.5	—	10.0	ns	1, 2
SYCLK duty cycle	$t_{KHK}/t_{SYCLK}$	40	—	60	%	2
SYCLK slew rate	—	1	—	4	V/ns	3
SYCLK peak period jitter	—	—	—	$\pm 150$	ps	—
SYCLK jitter phase noise at -56 dBc	—	—	—	500	kHz	4
AC Input Swing Limits at 1.8 V $OV_{DD}$	$\Delta V_{AC}$	1.08	—	1.8	V	—
<b>Notes:</b> 1. <b>Caution:</b> The relevant clock ratio settings must be chosen such that the resulting SYCLK frequencies do not exceed their respective maximum or minimum operating frequencies. 2. Measured at the rising edge and/or the falling edge at $OV_{DD}/2$ . 3. Slew rate as measured from $0.35 \times OV_{DD}$ to $0.65 \times OV_{DD}$ . 4. Phase noise is calculated as FFT of TIE jitter. 5. At recommended operating conditions with $OV_{DD} = 1.8$ V. See <a href="#">Table 3</a> . 6. The 125 MHz max frequency is limited to parts with 1200 MHz CPU frequency. The 133 MHz max frequency can be used for parts with 1600 MHz and 1400 MHz CPU frequency.						

### 3.7.2 Spread-spectrum sources

Spread-spectrum clock sources are an increasingly popular way to control electromagnetic interference emissions (EMI) by spreading the emitted noise to a wider spectrum and reducing the peak noise magnitude in order to meet industry and government requirements. These clock sources intentionally add long-term jitter to diffuse the EMI spectral content.

The jitter specification given in this table considers short-term (cycle-to-cycle) jitter only. The clock generator's cycle-to-cycle output jitter should meet the chip's input cycle-to-cycle jitter requirement.

Frequency modulation and spread are separate concerns; the chip is compatible with spread-spectrum sources if the recommendations listed in this table are observed.

**Table 14. Spread-spectrum clock source recommendations<sup>3</sup>**

Parameter	Min	Max	Unit	Notes
Frequency modulation	—	60	kHz	—
Frequency spread	—	1.0	%	1, 2
<b>Notes:</b> 1. SYSCLK frequencies that result from frequency spreading and the resulting core frequency must meet the minimum and maximum specifications given in <a href="#">Table 13</a> . 2. Maximum spread-spectrum frequency may not result in exceeding any maximum operating frequency of the device. 3. At recommended operating conditions with OVDD = 1.8 V. See <a href="#">Table 3</a> .				

### CAUTION

The processor's minimum and maximum SYSCLK and core/platform/DDR frequencies must not be exceeded, regardless of the type of clock source. Therefore, systems in which the processor is operated at its maximum rated core/platform/DDR frequency should use only down-spreading to avoid violating the stated limits.

### 3.7.3 USB 3.0 reference clock requirements

There are two options for the reference clock of USB PHY: SYSCLK or DIFF\_SYSCLK/DIFF\_SYSCLK\_B. This table provides the additional requirements when SYSCLK or DIFF\_SYSCLK/DIFF\_SYSCLK\_B is used as USB REFCLK. The 100 MHz reference clock is also required with the following requirements.

**Table 15. USB AC timing specifications**

Parameter	Symbol	Min	Max	Unit	Notes
Reference clock frequency-offset	F <sub>REF_OFFSET</sub>	-300.0	300.0	ppm	-
Reference clock random jitter (RMS)	J <sub>RMS_REF_CLK</sub>	-	3.0	ps	1, 2
Reference clock deterministic jitter	DJ <sub>REF_CLK</sub>	-	150.0	ps	3
Duty cycle	DC <sub>REF_CLK</sub>	40.0	60.0	%	-
1. 1.5 MHz to Nyquist frequency. For example, for 100 MHz reference clock, the Nyquist frequency is 50 MHz. 2. The peak-to-peak Rj specification is calculated at 14.069 times the Rj <sub>RMS</sub> for 10 <sup>-12</sup> BER. 3. DJ across all frequencies.					

### 3.7.4 Real-time clock timing

The real-time clock timing (RTC) input is sampled by the platform clock. The output of the sampling latch is then used as an input to the time base unit of the core; there is no need for jitter specification. The minimum period of the RTC signal should be greater than or equal to 16x the period of the platform clock with a 50% duty cycle. There is no minimum RTC frequency; RTC pin may be grounded if not needed.

### 3.7.5 Gigabit Ethernet reference clock timing

This table provides the Ethernet gigabit reference clock DC electrical characteristics with LV<sub>DD</sub> = 1.8 V.

**Table 16. ECn\_GTX\_CLK125 DC electrical characteristics (LV<sub>DD</sub> = 1.8 V)<sup>1</sup>**

Parameter	Symbol	Min	Typical	Max	Unit	Notes
Input high voltage	V <sub>IH</sub>	0.7 x OV <sub>DD</sub>	—	—	V	2
Input low voltage	V <sub>IL</sub>	—	—	0.3 x OV <sub>DD</sub>	V	2
Input capacitance	C <sub>IN</sub>	—	—	6	pF	—

ECn_GTX_CLK125 cycle time	t <sub>G125</sub>	7.5	8	8.5	ns	—
ECn_GTX_CLK125 rise and fall time LV <sub>DD</sub> = 1.8 V LV <sub>DD</sub> = 2.5 V	t <sub>G125R</sub> /t <sub>G125F</sub>	—	—	0.54 0.75	ns	2
ECn_GTX_CLK125 duty cycle 1000Base-T for RGMII	t <sub>G125H</sub> /t <sub>G125</sub>	40	—	60	%	3
ECn_GTX_CLK125 jitter	—	—	—	± 150	ps	3
<b>Notes:</b> 1. At recommended operating conditions with LV <sub>DD</sub> = 1.8 V ± 90mV / 2.5 V ± 125 mV. See <a href="#">Table 3</a> . 2. Rise times are measured from 20% of LV <sub>DD</sub> to 80% of LV <sub>DD</sub> . Fall times are measured from 80% of LV <sub>DD</sub> to 20% of LV <sub>DD</sub> . 3. ECn_GTX_CLK125 is used to generate the GTX clock for the Ethernet transmitter. See RGMII AC timing specifications for duty cycle for the 10Base-T and 100Base-T reference clocks.						

### 3.7.6 DDR clock (DDRCLK)

This section provides the DDRCLK DC electrical characteristics and AC timing specifications.

#### 3.7.6.1 DDRCLK DC electrical characteristics

This table provides the DDRCLK DC electrical characteristics.

**Table 19. DDRCLK DC electrical characteristics<sup>3</sup>**

Parameter	Symbol	Min	Typical	Max	Unit	Notes
Input high voltage	$V_{IH}$	$0.7 \times OV_{DD}$	—	—	V	1
Input low voltage	$V_{IL}$	—	—	$0.3 \times OV_{DD}$	V	1
Input capacitance	$C_{IN}$	—	7	12	pF	—
Input current ( $V_{IN} = 0V$ or $V_{IN} = OV_{DD}$ )	$I_{IN}$	—	—	$\pm 50$	$\mu A$	2

**Notes:**

1. The min  $V_{IL}$  and max  $V_{IH}$  values are based on the respective min and max  $OV_{IN}$  values found in [Table 3](#).
2. The symbol  $OV_{IN}$ , in this case, represents the  $OV_{IN}$  symbol referenced in [Table 3](#).
3. At recommended operating conditions with  $OV_{DD} = 1.8 V$ . See [Table 3](#).

**3.7.6.2 DDRCLK AC timing specifications**

This table provides the DDRCLK AC timing specifications.

**Table 20. DDRCLK AC timing specifications<sup>5</sup>**

Parameter/Condition	Symbol	Min	Typ	Max	Unit	Notes
DDRCLK frequency	$f_{DDRCLK}$	100.0	—	133.3	MHz	1, 2
DDRCLK cycle time	$t_{DDRCLK}$	7.5	—	10	ns	1, 2
DDRCLK duty cycle	$t_{KHK}/t_{DDRCLK}$	40	—	60	%	2
DDRCLK slew rate	—	1	—	4	V/ns	3
DDRCLK peak period jitter	—	—	—	$\pm 150$	ps	—
DDRCLK jitter phase noise at -56 dBc	—	—	—	500	kHz	4
AC Input Swing Limits at 1.8 V $OV_{DD}$	$\Delta V_{AC}$	1.08	—	1.8	V	—

**Notes:**

1. **Caution:** The relevant clock ratio settings must be chosen such that the resulting DDRCLK frequencies do not exceed their respective maximum or minimum operating frequencies.
2. Measured at the rising edge and/or the falling edge at  $OV_{DD}/2$ .
3. Slew rate as measured from  $0.35 \times OV_{DD}$  to  $0.65 \times OV_{DD}$ .
4. Phase noise is calculated as FFT of TIE jitter.
5. At recommended operating conditions with  $OV_{DD} = 1.8 V$ . See [Table 3](#).
6. DDRCLK pin does not provide the reference clock to DDR when chip is operated in Single Source Clocking mode.

**3.7.7 Differential system clock (DIFF\_SYSCLK/DIFF\_SYSCLK\_B) timing specifications**

The single source clocking mode requires a single on-board oscillator to provide reference clock input to the differential system clock pair (DIFF\_SYSCLK/DIFF\_SYSCLK\_B).

This differential clock pair input can provide the clock to core, platform, DDR, and SerDes1, SerDes2 PLLs, and USB PLLs.

This figure shows a receiver reference diagram of the differential system clock.

**Figure 10. LVDS receiver**

This section provides the differential system clock DC and AC timing specifications.

### 3.7.7.1 Differential system clock DC electrical characteristics

For DC electrical characteristics, see [DC-level requirements for SerDes reference clocks](#).

The differential system clock receiver's core power supply voltage requirements ( $SV_{DD}$ ) are specified in [Table 3](#).

The Differential system clock can also be single-ended. For this DIFF\_SYSCLK\_B should be connected to  $SV_{DD}/2$ .

### 3.7.7.2 Differential system clock AC timing specifications

The DIFF\_SYSCLK/DIFF\_SYSCLK\_B input pair supports an input clock frequency of 100 MHz.

For AC timing specifications, see [AC requirements for SerDes reference clocks](#).

Spread-spectrum clocking is not supported on differential system clock pair input.

### 3.7.8 Other input clocks

A description of the overall clocking of this device is available in the chip reference manual in the form of a clock subsystem block diagram. For information about the input clock requirements of functional modules sourced external of the chip, such as SerDes, Ethernet management, eSDHC, and IFC, see the specific interface section.

## 3.8 RESET initialization timing specifications

This table provides the AC timing specifications for the RESET initialization timing.

**Table 21. RESET Initialization timing specifications**

Parameter/Condition	Min	Max	Unit	Notes
Required assertion time of PORESET_B after V <sub>DD</sub> is stable	1	—	ms	1
Required input assertion time of HRESET_B	32	—	SYSCLKs	2, 3
Maximum rise/fall time of HRESET_B	—	10	SYSCLK	4
Maximum rise/fall time of PORESET_B	—	1	SYSCLK	4
Input setup time for POR configs (other than cfg_eng_use0) with respect to negation of PORESET_B	4	—	SYSCLKs	2, 5
Input hold time for all POR configs with respect to negation of PORESET_B	2	—	SYSCLKs	2
Maximum valid-to-high impedance time for actively driven POR configs with respect to negation of PORESET_B	—	5	SYSCLKs	2
<b>Notes:</b> 1. PORESET_B must be driven asserted before the core and platform power supplies are powered up. 2. SYSCLK is the primary clock input for the chip. 3. The device asserts HRESET_B as an output when PORESET_B is asserted to initiate the power-on reset process. The device releases HRESET_B sometime after PORESET_B is deasserted. The exact sequencing of HRESET_B deassertion is documented in the reference manual's "Power-on Reset Sequence" section. 4. The system/board must be designed to ensure the input requirement to the device is achieved. Proper device operation is guaranteed for inputs meeting this requirement by design, simulation, characterization, or functional testing. 5. For proper clock selection, terminate cfg_eng_use0 with a pull up or pull down of 4.7 k $\Omega$ to ensure that the signal will have a valid state as soon as the IO voltage reach its operating condition.				

This table provides the phase-locked loop (PLL) lock times.

**Table 22. PLL lock times**

Parameter/Condition	Min	Max	Unit	Notes
PLL lock times (Core, platform, DDR only)	—	100	$\mu$ s	—

## 3.9 Battery-backed security monitor interface

This section describes the DC and AC electrical characteristics for the battery-backed security monitor interface, which includes TA\_BB\_TMP\_DETECT\_B.

### 3.9.1 Battery-backed security monitor interface DC electrical characteristics

This table provides the DC electrical characteristics for the battery-backed security monitor interface operating at 1.0 V (TA\_BB\_V<sub>DD</sub>).

**Table 23. Battery-backed security monitor interface DC electrical characteristics (TA\_BB\_V<sub>DD</sub> = 1.0 V)<sup>3</sup>**

Parameter	Symbol	Min	Max	Unit	Notes
Input high voltage	V <sub>IH</sub>	0.7 x TA_BB_V <sub>DD</sub>	—	V	1
Input low voltage	V <sub>IL</sub>	—	0.3 x TA_BB_V <sub>DD</sub>	V	1
Input current (V <sub>IN</sub> = 0 V or V <sub>IN</sub> = TA_BB_V <sub>DD</sub> )	I <sub>IN</sub>	—	±50	μA	2
1. The min V <sub>IL</sub> and max V <sub>IH</sub> values are based on the respective min and max TA_BB_V <sub>DD</sub> values found in <a href="#">Table 3</a> . 2. The symbol V <sub>IN</sub> , in this case, represents the TA_BB_V <sub>DD</sub> symbol referenced in <a href="#">Table 3</a> . 3. For recommended operating conditions, see <a href="#">Table 3</a> .					

This table provides the DC electrical characteristics for the battery-backed security monitor interface operating at 0.9 V (TA\_BB\_V<sub>DD</sub>).

**Table 24. Battery-backed security monitor interface DC electrical characteristics (TA\_BB\_V<sub>DD</sub> = 0.9 V)<sup>3</sup>**

Parameter	Symbol	Min	Max	Unit	Notes
Input high voltage	V <sub>IH</sub>	0.7 x TA_BB_V <sub>DD</sub>	—	V	1
Input low voltage	V <sub>IL</sub>	—	0.3 x TA_BB_V <sub>DD</sub>	V	1
Input current (V <sub>IN</sub> = 0 V or V <sub>IN</sub> = TA_BB_V <sub>DD</sub> )	I <sub>IN</sub>	—	±50	μA	2
1. The min V <sub>IL</sub> and max V <sub>IH</sub> values are based on the respective min and max TA_BB_V <sub>DD</sub> values found in <a href="#">Table 3</a> . 2. The symbol V <sub>IN</sub> , in this case, represents the TA_BB_V <sub>DD</sub> symbol referenced in <a href="#">Table 3</a> . 3. For recommended operating conditions, see <a href="#">Table 3</a> .					

### 3.9.2 Battery-backed security monitor interface AC timing specifications

This table provides the AC timing specifications for the battery-backed security monitor interface.

**Table 25. Battery-backed security monitor interface AC timing specifications<sup>2</sup>**

Parameter	Symbol	Min	Typ	Max	Unit	Notes
TA_BB_TMP_DETECT_B	$t_{\text{TMP}}$	100			ns	1
<b>Notes:</b> 1. TA_BB_TMP_DETECT_B is asynchronous to any clock. 2. For recommended operating conditions, see <a href="#">Table 3</a> .						

## 3.10 DDR4 SDRAM controller

This section describes the DC and AC electrical specifications for the DDR4 SDRAM controller interface. Note that the required  $GV_{\text{DD}}(\text{typ})$  voltage is 1.2 V when interfacing to DDR4 SDRAM.

### 3.10.1 DDR4 SDRAM interface DC electrical characteristics

This table provides the recommended operating conditions for the DDR SDRAM controller when interfacing to DDR4 SDRAM.

**Table 26. DDR4 SDRAM interface DC electrical characteristics ( $GV_{\text{DD}} = 1.2 \text{ V}$ )<sup>1</sup>**

Parameter	Symbol	Min	Max	Unit	Notes
Input low	$V_{\text{IL}}$	—	$0.7 \times GV_{\text{DD}} - 0.175$	V	3, 6
Input high	$V_{\text{IH}}$	$0.7 \times GV_{\text{DD}} + 0.175$	—	V	3, 6
I/O leakage current	$I_{\text{OZ}}$	-165	165	$\mu\text{A}$	5
<b>Notes:</b> 1. $GV_{\text{DD}}$ is expected to be within 60 mV of the DRAM's voltage supply at all times. The DRAM's and memory controller's voltage supply may or may not be from the same source. 2. $V_{\text{TT}}$ and $V_{\text{REFCA}}$ are applied directly to the DRAM device. Both $V_{\text{TT}}$ and $V_{\text{REFCA}}$ voltages must track $GV_{\text{DD}}/2$ . 3. Input capacitance load for DQ, DQS, and DQS_B are available in the IBIS models. 4. See the IBIS model for the complete output IV curve characteristics. 5. Output leakage is measured with all outputs disabled, $0\text{V} \leq V_{\text{OUT}} \leq GV_{\text{DD}}$ . Made internal per Mazzyar's updates in DDR4 spec v2.					

**Table 26. DDR4 SDRAM interface DC electrical characteristics ( $GV_{DD} = 1.2\text{ V}$ )<sup>1</sup>**

Parameter	Symbol	Min	Max	Unit	Notes
6. Internal Vref for data bus must be set to $0.7 \times GV_{DD}$ .					
7. For recommended operating conditions, see <a href="#">Table 3</a> .					

### 3.10.2 DDR4 SDRAM interface AC timing specifications

This section provides the AC timing specifications for the DDR SDRAM controller interface. The DDR controller supports DDR4 memories. Note that the required  $GV_{DD}(\text{typ})$  voltage is 1.2 V when interfacing to DDR4 SDRAM.

#### 3.10.2.1 DDR4 SDRAM interface input AC timing specifications

This table provides the input AC timing specifications for the DDR controller when interfacing to DDR4 SDRAM.

**Table 27. DDR4 SDRAM interface input AC timing specifications ( $GV_{DD} = 1.2\text{ V} \pm 5\%$ )<sub>1</sub>**

Parameter	Symbol	Min	Max	Unit	Notes
AC input low voltage $\leq 2133\text{ MT/s}$ data rate	$V_{ILAC}$	—	$0.7 \times GV_{DD} - 0.175$	V	—
AC input high voltage $\leq 2133\text{ MT/s}$ data rate	$V_{IHAC}$	$0.7 \times GV_{DD} + 0.175$	—	V	—
<b>Note:</b>					
1. For recommended operating conditions, see <a href="#">Table 3</a> .					

This table provides the input AC timing specifications for the DDR controller when interfacing to DDR4 SDRAM.

**Table 28. DDR4 SDRAM interface input AC timing specifications ( $GV_{DD} = 1.2\text{ V} \pm 5\%$  for DDR4)<sup>3</sup>**

Parameter	Symbol	Min	Max	Unit	Notes
Controller skew for MDQS-MDQ/MECC	$t_{CISKEW}$	—	—	ps	1
2100 MT/s data rate		-80	80		
1800 MT/s data rate		-93	93		
1600 MT/s data rate		-112	112		
1333 MT/s data rate		-125	125		
Tolerated Skew for MDQS-MDQ/MECC	$t_{DISKEW}$	—	—	ps	2
2100 MT/s data rate		-154	154		
1800 MT/s data rate		-175	175		

Table continues on the next page...

**Table 28. DDR4 SDRAM interface input AC timing specifications ( $GV_{DD} = 1.2\text{ V} \pm 5\%$  for DDR4)<sup>3</sup> (continued)**

Parameter	Symbol	Min	Max	Unit	Notes
1600 MT/s data rate		-200	200		
1333 MT/s data rate		-250	250		
<b>Notes:</b> 1. t <sub>CISKEW</sub> represents the total amount of skew consumed by the controller between MDQS[n] and any corresponding bit that is captured with MDQS[n]. This must be subtracted from the total timing budget. 2. The amount of skew that can be tolerated from MDQS to a corresponding MDQ signal is called t <sub>DISKEW</sub> . This can be determined by the following equation: t <sub>DISKEW</sub> = ±(T ÷ 4 - abs (t <sub>CISKEW</sub> )) where T is the clock period and abs(t <sub>CISKEW</sub> ) is the absolute value of t <sub>CISKEW</sub> . 3. For recommended operating conditions, see <a href="#">Table 3</a> .					

This figure shows the DDR4 SDRAM interface input timing diagram.

<p>1. The symbols used for timing specifications follow the pattern of t<sub>(first two letters of functional block)(signal)(state) (reference)(state)</sub> for inputs and t<sub>(first two letters of functional block)(reference)(state)(signal)(state)</sub> for outputs. Output hold time can be read as DDR timing (DD) from the rising or falling edge of the reference clock (KH or KL) until the output went invalid (AX or DX). For example, t<sub>DDKHAS</sub> symbolizes DDR timing (DD) for the time t<sub>MCK</sub> memory clock reference (K) goes from the high (H) state until outputs (A) are setup (S) or output valid time. Also, t<sub>DDKLDX</sub> symbolizes DDR timing (DD) for the time t<sub>MCK</sub> memory clock reference (K) goes low (L) until data outputs (D) are invalid (X) or data output hold time.</p> <p>2. All MCK/MCK_B and MDQS/MDQS_B referenced measurements are made from the crossing of the two signals.</p> <p>3. ADDR/CMD/CNTL includes all DDR SDRAM output signals except MCK/MCK_B, MCS_B, and MDQ/MECC/MDM/MDQS.</p> <p>4. Note that t<sub>DDKMHM</sub> follows the symbol conventions described in note 1. For example, t<sub>DDKMHM</sub> describes the DDR timing (DD) from the rising edge of the MCK[n] clock (KH) until the MDQS signal is valid (MH). t<sub>DDKMHM</sub> can be modified through control of the MDQS override bits (called WR_DATA_DELAY) in the TIMING_CFG_2 register. This is typically set to the same delay as in DDR_SDRAM_CLK_CNTL[CLK_ADJUST]. The timing parameters listed in the table assume that these two parameters have been set to the same adjustment value. See the chip reference manual for a description and explanation of the timing modifications enabled by the use of these bits.</p> <p>5. Available eye for data (MDQ), ECC (MECC), and data mask (MDM) outputs at the pin of the processor. Memory controller will center the strobe (MDQS) in the available data eye at the DRAM (end point) during the initialization.</p> <p>6. Note that this is required to program the start value of the DQS adjust for write leveling.</p> <p>7. For recommended operating conditions, see <a href="#">Table 3</a>.</p>					

**NOTE**

For the ADDR/CMD/CNTL setup and hold specifications in [Table 3](#), it is assumed that the clock control register is set to

adjust the memory clocks by  $\frac{1}{2}$  applied cycle for data rates of 1866 MT/s or less and  $\frac{9}{16}$  applied cycle for data rates greater than 1866 MT/s. It is recommended that, during system validation, memory clocks are adjusted to best fit the particular system design.

### 3.11 Dual universal asynchronous receiver/transmitter (DUART) interface

This section describes the DC and AC electrical characteristics for the DUART interface.

#### 3.11.1 DUART DC electrical characteristics

This table provides the DC electrical characteristics for the DUART interface when operating at  $DV_{DD} = 3.3\text{ V}$ .

**Table 30. DUART DC electrical characteristics ( $DV_{DD} = 3.3\text{ V}$ )<sup>1</sup>**

Parameter	Symbol	Min	Max	Unit	Notes
Input high voltage	$V_{IH}$	$0.7 \times DV_{DD}$	-	V	2
Input low voltage	$V_{IL}$	-	$0.2 \times DV_{DD}$	V	2

Table continues on the next page...

**Table 30. DUART DC electrical characteristics ( $DV_{DD} = 3.3\text{ V}$ )<sup>1</sup> (continued)**

Parameter	Symbol	Min	Max	Unit	Notes
Input current ( $V_{IN} = 0\text{V}$ or $V_{IN} = DV_{DD}$ )	$I_{IN}$	-50	50	$\mu\text{A}$	3
Output high voltage ( $I_{OH} = -2.0\text{ mA}$ )	$V_{OH}$	2.4	-	V	-
Output low voltage ( $I_{OL} = 2.0\text{ mA}$ )	$V_{OL}$	-	0.4	V	-
1. For recommended operating conditions, see <a href="#">Table 3</a> . 2. Note that the min $V_{IL}$ and max $V_{IH}$ values are based on the respective min and max $DV_{IN}$ values found in the Recommended Operating Conditions table. 3. Note that the symbol $DV_{IN}$ represents the input voltage of the supply referenced in the Recommended Operating Conditions table.					

This table provides the DC electrical characteristics for the DUART interface when operating at  $DV_{DD} = 1.8\text{ V}$ .

**Table 31. DUART DC electrical characteristics ( $DV_{DD} = 1.8\text{ V}$ )<sup>1</sup>**

Parameter	Symbol	Min	Max	Unit	Notes
Input high voltage	$V_{IH}$	$0.7 \times DV_{DD}$	-	V	2
Input low voltage	$V_{IL}$	-	$0.3 \times DV_{DD}$	V	2
Input current ( $V_{IN} = 0\text{V}$ or $V_{IN} = DV_{DD}$ )	$I_{IN}$	-50	50	$\mu\text{A}$	3

Output low voltage ( $I_{OL} = 0.5\text{ mA}$ )	$V_{OL}$	-	0.4	V	-
1. For recommended operating conditions, see <a href="#">Table 3</a> . 2. Note that the min $V_{IL}$ and max $V_{IH}$ values are based on the respective min and max $DV_{IN}$ values found in the Recommended Operating Conditions table. 3. Note that the symbol $DV_{IN}$ represents the input voltage of the supply referenced in the Recommended Operating Conditions table.					

### 3.11.2 DUART AC timing specifications

This table provides the AC timing specifications for the DUART interface.

**Table 32. DUART AC timing specifications**

Parameter	Symbol	Min	Max	Unit	Notes
Minimum baud rate	baud	$f_{PLAT}/(2 \times 1,048,576)$	-	baud	1, 2
Maximum baud rate	baud	-	$f_{PLAT}/(2 \times 16)$	baud	1, 3
1. $f_{PLAT}$ refers to the internal platform clock. 2. The middle of a start bit is detected as the 8th sampled 0 after the 1-to-0 transition of the start bit. Subsequent bit values are sampled each 16th sample. 3. The actual attainable baud rate is limited by the latency of interrupt processing.					

## 3.12 Enhanced secure digital host controller (eSDHC)

This section describes the DC and AC electrical specifications for the eSDHC interface.

### 3.12.1 eSDHC DC electrical characteristics

This table provides the DC electrical characteristics for the eSDHC interface.

**Table 33. eSDHC interface DC electrical characteristics (E/DV<sub>DD</sub>=3.3 V)<sup>3</sup>**

**Notes:**

- The symbols used for timing specifications herein follow the pattern of t<sub>(first two letters of functional block)(signal)(state) (reference)(state)</sub> for inputs and t<sub>(first two letters of functional block)(reference)(state)(signal)(state)</sub> for outputs. For example, t<sub>SHKHGX</sub> symbolizes eSDHC high-speed mode device timing (SH) clock reference (K) going to the high (H) state, with respect to the output (O) reaching the invalid state (X) or output hold time. Note that in general, the clock reference symbol is based on five letters representing the clock of a particular functional. For rise and fall times, the latter convention is used with the appropriate letter: R (rise) or F (fall).
- In full-speed mode, the clock frequency value can be 0-25MHz for an SD/SDIO card and 0-20MHz for an MMC card. In high-speed mode, the clock frequency value can be 0-50MHz for an SD/SDIO card and 0-52MHz for an MMC card.

**Table 35. eSDHC AC timing specifications (full-speed/high-speed mode)<sup>6</sup>**

Parameter	Symbol <sup>1</sup>	Min	Max	Unit	Notes
3. SDHC_SYNC_OUT/IN loop back is recommended to compensate the clock delay. In case the SDHC_SYNC_OUT/IN loopback is not used, to satisfy setup timing, one-way board-routing delay between host and card, on SDHC_CLK, SDHC_CMD, and SDHC_DATx should not exceed 1ns for any high-speed MMC card. For any high-speed or default speed mode SD card, the one-way board-routing delay between host and card, on SDHC_CLK, SDHC_CMD, and SDHC_DATx should not exceed 1.5ns.					
4. $C_{CARD} \leq 10 \text{ pF}$ , (1 card), and $C_L = C_{BUS} + C_{HOST} + C_{CARD} \leq 40 \text{ pF}$ .					
5. The parameter values apply to both full-speed and high-speed modes.

### 3.13 Ethernet interface (EMI, RGMII, and IEEE Std 1588™)

This section describes the DC and AC electrical characteristics for the Ethernet controller, Ethernet management, RGMII, and IEEE Std 1588 interfaces.

#### 3.13.1 Ethernet management interface (EMI)

This section describes the electrical characteristics for the Ethernet management interface (EMI).

The EMI1 and EMI2 interface timings are compatible with IEEE Std 802.3™ clauses 22 and 45, respectively.

### 3.13.1.1 Ethernet management interface 1 (EMI1)

This section describes the electrical characteristics for the EMI1 interface.

The EMI1 interface timing is compatible with IEEE Std 802.3™ clause 22.

#### 3.13.1.1.1 EMI1 DC electrical characteristics

This section describes the DC electrical characteristics for EMI1\_MDIO and EMI1\_MDC. The pins are available on LV<sub>DD</sub>. For operating voltages, see the Recommended operating conditions table.

This table provides the EMI1 DC electrical characteristics when operating at LV<sub>DD</sub> = 2.5 V.

### 3.13.1.2.2 EMI2 AC timing specifications

This table provides the AC timing specifications for the EMI2 interface.

**Table 45. EMI2 AC timing specifications<sup>4</sup>**

Parameter	Symbol	Min	Max	Unit	Notes
MDC frequency	$f_{MDC}$	-	2.5	MHz	1
MDC clock pulse width high	$t_{MDCH}$	160.0	-	ns	-
MDC to MDIO delay	$t_{MDKHDX}$	$(5 \times t_{enet\_clk}) - 3$	$(5 \times t_{enet\_clk}) + 3$	ns	2, 3
MDIO to MDC setup time	$t_{MDDVKH}$	8.0	-	ns	-
MDIO to MDC hold time	$t_{MDDXKH}$	2	-	ns	5

1. This parameter is dependent on the Ethernet clock frequency. The MDIO\_CFG [MDIO\_CLK\_DIV] field determines the clock frequency of the MgmtClk Clock EC\_MDC.

2. This parameter is dependent on the Ethernet clock frequency. The delay is equal to 5 Ethernet clock periods  $\pm$  3 ns. For example, with an Ethernet clock of 400 MHz, the min/max delay is 12.5 ns  $\pm$  3 ns.

3.  $t_{enet\_clk}$  is the Ethernet clock period (Frame Manager clock period x 2).

4. The symbols used for timing specifications follow these patterns:  $t_{(first\ two\ letters\ of\ functional\ block)(signal)(state)(reference)(state)}$  for inputs and  $t_{(first\ two\ letters\ of\ functional\ block)(reference)(state)(signal)(state)}$  for outputs. For example,  $t_{MDKHDX}$  symbolizes management data timing (MD) for the time  $t_{MDC}$  from clock reference (K) high (H) until data outputs (D) are invalid (X) or data hold time. Also,  $t_{MDDVKH}$  symbolizes management data timing (MD) with respect to the time data input signals (D) reach the valid state (V) relative to the  $t_{MDC}$  clock reference (K) going to the high (H) state or setup time.

TSEC_1588_CLK_IN peak-to-peak jitter	$t_{T1588CLKINJ}$	-	-	250.0	ps	-
Rise time TSEC_1588_CLK_IN (20% to 80%)	$t_{T1588CLKINR}$	1.0	-	2.0	ns	-
Fall time TSEC_1588_CLK_IN (80% to 20%)	$t_{T1588CLKINF}$	1.0	-	2.0	ns	-
TSEC_1588_CLK_OUT clock period	$t_{T1588CLKOUT}$	$2 \times t_{T1588CLK}$	-	-	ns	2
TSEC_1588_CLK_OUT duty cycle	$t_{T1588CLKOTH}/t_{T1588CLKOUT}$	30.0	50.0	70.0	%	-
TSEC_1588_PULSE_OUT1/2, TSEC_1588_ALARM_OUT1/2	$t_{T1588OV}$	0.5	-	4.0	ns	-
TSEC_1588_TRIG_IN1/2 pulse width	$t_{T1588TRIGH}$	$2 \times t_{T1588CLK}$	-	-	ns	1, 3

1. This needs to be at least two times the clock period of the clock selected by TMR\_CTRL[CKSEL]. See the chip reference manual for a description of TMR\_CTRL registers.

2. There are three input clock sources for 1588: TSEC\_1588\_CLK\_IN, RTC, and MAC clock / platform clock. When using TSEC\_1588\_CLK\_IN, the minimum clock period is  $2 \times t_{T1588CLK}$ .

3. The maximum value of  $t_{T1588CLK}$  is not only defined by the value of TRX\_CLK, but also defined by the recovered clock. For example, for 10/100/1000 Mbps modes, the maximum value of  $t_{T1588CLK}$  will be 2800, 280, and 56 ns, respectively.

This figure shows the data and command output AC timing diagram.

**Note:** The output delay is counted starting at the rising edge if  $t_{T1588CLKOUT}$  is non-inverting. Otherwise, it is counted starting at the falling edge.

Parameter	Symbol	Min	Typ	Max	Unit	Notes
7. In general, the clock reference symbol representation is based on the symbol RGT, which represents RGMII timing. Note that the notation for rise (R) and fall (F) times follows the clock symbol that is being represented. For symbols representing skews, the subscript is skew (SK) followed by the clock that is being skewed (RGT).						

This figure shows the RGMII AC timing and multiplexing diagrams.

GIC inputs and outputs are asynchronous to any visible clock. GIC outputs must be synchronized before use by any external synchronous logic. GIC inputs are required to be valid for at least $t_{PIWID}$ ns to ensure proper operation when working in edge triggered mode.				

## 3.16 High-speed serial interfaces (HSSI)

The chip features a Serializer/Deserializer (SerDes) interface to be used for high-speed serial interconnect applications. The SerDes interface can be used for PCI Express, SGMII, and serial ATA (SATA) data transfers.

This section describes the most common portion of the SerDes DC electrical specifications: the DC requirement for SerDes reference clocks. The SerDes data lane's transmitter (Tx) and receiver (Rx) reference circuits are also described.

### 3.16.1 Signal terms definitions

The SerDes utilizes differential signaling to transfer data across the serial link. This section defines the terms that are used in the description and specification of differential signals.

This figure shows how the signals are defined. For illustration purposes only, one SerDes lane is used in the description. This figure shows the waveform for either a transmitter output (SD\_TX $n$ \_P and SD\_TX $n$ \_N) or a receiver input (SD\_RX $n$ \_P and SD\_RX $n$ \_N). Each signal swings between A volts and B volts where  $A > B$ .

**Figure 29. Differential voltage definitions for transmitter or receiver**

Using this waveform, the definitions are as described in the following list. To simplify the illustration, the definitions assume that the SerDes transmitter and receiver operate in a fully symmetrical differential signaling environment:

#### Single-Ended Swing

The transmitter output signals and the receiver input signals SD\_TXn\_P, SD\_TXn\_N, SD\_RXn\_P and SD\_RXn\_N each have a peak-to-peak swing of  $A - B$  volts. This is also referred to as each signal wire's single-ended swing.

#### Differential Output Voltage, $V_{OD}$ (or Differential Output Swing)

The differential output voltage (or swing) of the transmitter,  $V_{OD}$ , is defined as the difference of the two complementary output voltages:  $V_{SD\_TXn\_P} - V_{SD\_TXn\_N}$ . The  $V_{OD}$  value can be either positive or negative.

#### Differential Input Voltage, $V_{ID}$ (or Differential Input Swing)

The differential input voltage (or swing) of the receiver,  $V_{ID}$ , is defined as the difference of the two complementary input voltages:  $V_{SD\_RXn\_P} - V_{SD\_RXn\_N}$ . The  $V_{ID}$  value can be either positive or negative.

#### Differential Peak Voltage, $V_{DIFFp}$

The peak value of the differential transmitter output signal or the differential receiver input signal is defined as the differential peak voltage,  $V_{DIFFp} = |A - B|$  volts.

#### Differential Peak-to-Peak, $V_{DIFFp-p}$

Because the differential output signal of the transmitter and the differential input signal of the receiver each range from  $A - B$  to  $-(A - B)$  volts, the peak-to-peak value of the differential transmitter output signal or the differential receiver input signal is defined as differential peak-to-peak voltage,  $V_{DIFFp-p} = 2 \times V_{DIFFp} = 2 \times |A - B|$  volts, which is twice the differential swing in amplitude, or twice the differential peak. For example, the output differential peak-to-peak voltage can also be calculated as  $V_{TX-DIFFp-p} = 2 \times |V_{OD}|$ .

#### Differential Waveform

The differential waveform is constructed by subtracting the inverting signal (SD\_TXn\_N, for example) from the non-inverting signal (SD\_TXn\_P, for example)

within a differential pair. There is only one signal trace curve in a differential waveform. The voltage represented in the differential waveform is not referenced to ground. See [Figure 34](#) as an example for differential waveform.

#### Common Mode Voltage, $V_{cm}$

The common mode voltage is equal to half of the sum of the voltages between each conductor of a balanced interchange circuit and ground. In this example, for SerDes output,  $V_{cm\_out} = (V_{SD\_TXn\_P} + V_{SD\_TXn\_N}) \div 2 = (A + B) \div 2$ , which is the arithmetic mean of the two complementary output voltages within a differential pair. In a system, the common mode voltage may often differ from one component's output to the other's input. It may be different between the receiver input and driver output circuits within the same component. It is also referred to as the DC offset on some occasions.

To illustrate these definitions using real values, consider the example of a current mode logic (CML) transmitter that has a common mode voltage of 2.25 V and outputs, TD and TD\_B. If these outputs have a swing from 2.0 V to 2.5 V, the peak-to-peak voltage swing of each signal (TD or TD\_B) is 500 mV p-p, which is referred to as the single-ended swing for each signal. Because the differential signaling environment is fully symmetrical in this example, the transmitter output's differential swing ( $V_{OD}$ ) has the same amplitude as each signal's single-ended swing. The differential output signal ranges between 500 mV and -500 mV. In other words,  $V_{OD}$  is 500 mV in one phase and -500 mV in the other phase. The peak differential voltage ( $V_{DIFFp}$ ) is 500 mV. The peak-to-peak differential voltage ( $V_{DIFFp-p}$ ) is 1000 mV p-p.

### 3.16.2 SerDes reference clocks

The SerDes reference clock inputs are applied to an internal phase-locked loop (PLL) whose output creates the clock used by the corresponding SerDes lanes. The SerDes reference clocks inputs are  $SDn\_REF\_CLK[1:2]_P$  and  $SDn\_REF\_CLK[1:2]_N$ .

SerDes may be used for various combinations of the following IP block based on the RCW Configuration field  $SRDS\_PRTCLn$ :

- SGMII (1.25 Gbaud or 3.125 Gbaud), QSGMII (5 Gbps)
- XFI (10.3125 Gb/s)
- PCIe (2.5, 5, and 8 GT/s)
- SATA (1.5, 3.0, and 6.0 Gbps)

The following sections describe the SerDes reference clock requirements and provide application information.

### 3.16.2.1 SerDes spread-spectrum clock source recommendations

SD $n$ \_REF\_CLK $n$ \_P and SD $n$ \_REF\_CLK $n$ \_N are designed to work with spread-spectrum clocking for the PCI Express protocol only with the spreading specification defined in [Table 64](#). When using spread-spectrum clocking for PCI Express, both ends of the link partners should use the same reference clock. For best results, a source without significant unintended modulation must be used.

The SerDes transmitter does not support spread-spectrum clocking for the SATA protocol. The SerDes receiver does support spread-spectrum clocking on receive, which means the SerDes receiver can receive data correctly from a SATA serial link partner using spread-spectrum clocking.

Spread-spectrum clocking cannot be used if the same SerDes reference clock is shared with other non-spread-spectrum-supported protocols. For example, if spread-spectrum clocking is desired on a SerDes reference clock for the PCI Express protocol and the same reference clock is used for any other protocol, such as SATA or SGMII because of the SerDes lane usage mapping option, spread-spectrum clocking cannot be used at all.

This table provides the source recommendations for SerDes spread-spectrum clocking.

**Table 64. SerDes spread-spectrum clock source recommendations <sup>1</sup>**

Parameter	Min	Max	Unit	Notes
Frequency modulation	30	33	kHz	—
Frequency spread	+0	-0.5	%	2
<b>Notes:</b> 1. At recommended operating conditions. See <a href="#">Table 3</a> . 2. Only down-spreading is allowed.				

### 3.16.2.2 SerDes reference clock receiver characteristics

This figure shows a receiver reference diagram of the SerDes reference clocks.

**Figure 30. Receiver of SerDes reference clocks**

The characteristics of the clock signals are as follows:

- The SerDes transceiver's core power supply voltage requirements ( $SV_{DD}$ ) are as specified in [Table 3](#).
- The SerDes reference clock receiver reference circuit structure is as follows:
  - The  $SDn\_REF\_CLKn\_P$  and  $SDn\_REF\_CLKn\_N$  are internally AC-coupled differential inputs as shown in [Figure 30](#). Each differential clock input ( $SDn\_REF\_CLKn\_P$  or  $SDn\_REF\_CLKn\_N$ ) has on-chip 50- $\Omega$  termination to  $SGNDn$  followed by on-chip AC-coupling.
  - The external reference clock driver must be able to drive this termination.
  - The SerDes reference clock input can be either differential or single-ended. See the differential mode and single-ended mode descriptions in [Signal terms definitions](#) for detailed requirements.
- The maximum average current requirement also determines the common mode voltage range.
  - When the SerDes reference clock differential inputs are DC coupled externally with the clock driver chip, the maximum average current allowed for each input pin is 8 mA. In this case, the exact common mode input voltage is not critical as long as it is within the range allowed by the maximum average current of 8 mA because the input is AC-coupled on-chip.
  - This current limitation sets the maximum common mode input voltage to be less than 0.4 V ( $0.4\text{ V} \div 50 = 8\text{ mA}$ ) while the minimum common mode input level is 0.1 V above  $SGNDn$ . For example, a clock with a 50/50 duty cycle can be produced by a clock driver with output driven by its current source from 0 mA to 16 mA (0-0.8 V), such that each phase of the differential input has a single-ended swing from 0 V to 800 mV with the common mode voltage at 400 mV.
  - If the device driving the  $SDn\_REF\_CLKn\_P$  and  $SDn\_REF\_CLKn\_N$  inputs cannot drive 50  $\Omega$  to  $SGNDn$  DC or the drive strength of the clock driver chip exceeds the maximum input current limitations, it must be AC-coupled off-chip.
- The input amplitude requirement is described in detail in the following sections.

### 3.16.2.3 DC-level requirements for SerDes reference clocks

The DC-level requirements for the SerDes reference clock inputs are different depending on the signaling mode used to connect the clock driver chip and SerDes reference clock inputs, as described below:

- **Differential Mode**
  - The input amplitude of the differential clock must be between 400 mV and 1600 mV differential peak-to-peak (or between 200 mV and 800 mV differential peak). In other words, each signal wire of the differential pair must have a single-ended swing of less than 800 mV and greater than 200 mV. This requirement is the same for both external DC-coupled or AC-coupled connection.
  - For an external DC-coupled connection, as described in [Figure 30](#), the maximum average current requirements set the requirement for average voltage (common mode voltage) as between 100 mV and 400 mV.
  - This figure shows the SerDes reference clock input requirement for a DC-coupled connection scheme.

**Figure 31. Differential reference clock input DC requirements (external DC-coupled)**

- For an external AC-coupled connection, there is no common mode voltage requirement for the clock driver. Because the external AC-coupling capacitor blocks the DC level, the clock driver and the SerDes reference clock receiver operate in different common mode voltages. The SerDes reference clock receiver in this connection scheme has its common mode voltage set to  $SGNDn$ . Each signal wire of the differential inputs is allowed to swing below and above the common mode voltage ( $SGNDn$ ).
- This figure shows the SerDes reference clock input requirement for an AC-coupled connection scheme.

**Figure 32. Differential reference clock input DC requirements (external AC-coupled)**

- Single-ended mode
  - The reference clock can also be single-ended. The SDn\_REF\_CLKn\_P input amplitude (single-ended swing) must be between 400 mV and 800 mV peak-to-peak (from  $V_{MIN}$  to  $V_{MAX}$ ) with SDn\_REF\_CLKn\_N either left unconnected or tied to ground.
  - To meet the input amplitude requirement, the reference clock inputs may need to be externally DC- or AC-coupled. For the best noise performance, the reference of the clock could be DC- or AC-coupled into the unused phase (SDn\_REF\_CLKn\_N) through the same source impedance as the clock input (SDn\_REF\_CLKn\_P) in use.
  - The SDn\_REF\_CLKn\_P input average voltage must be between 200 and 400 mV.
  - This figure shows the SerDes reference clock input requirement for single-ended signaling mode.

**Figure 33. Single-ended reference clock input DC requirements**

### 3.16.2.4 AC requirements for SerDes reference clocks

This table provides the AC requirements for SerDes reference clocks for PCI Express protocols running at data rates up to 8 GT/s.

## Electrical characteristics

This includes PCI Express (2.5, 5, and 8 GT/s), SGMII (1.25 Gbaud), 2.5 x SGMII (3.125 Gbaud), QSGMII (5 Gbps), and SATA (1.5, 3.0, and 6.0 Gbps). SerDes reference clocks need to be verified by the customer's application design.

**Table 65. SDn\_REF\_CLKn\_P and SDn\_REF\_CLKn\_N input clock requirements (SV<sub>DD</sub> = 0.9V/1.0 V) <sup>1</sup>**

Parameter	Symbol	Min	Typ	Max	Unit	Notes

### Notes:

- For recommended operating conditions, see [Table 3](#).
- Caution:** Only 100, 125, and 156.25 have been tested. In-between values do not work correctly with the rest of the system.
- For PCI Express (2.5, 5 and 8 GT/s).
- For SGMII, 2.5 x SGMII and QSGMII.
- Measurement taken from differential waveform.
- Limits from PCI Express CEM Rev 2.0.
- For PCI Express 5 GT/s, per PCI Express base specification Rev 3.0.
- For PCI Express 8 GT/s, per PCI Express base specification Rev. 3.0.
- Measured from -200 mV to +200 mV on the differential waveform (derived from SDn\_REF\_CLKn\_P minus SDn\_REF\_CLKn\_N). The signal must be monotonic through the measurement region for rise and fall time. The 400 mV measurement window is centered on the differential zero crossing. See [Figure 34](#).
- Measurement taken from single-ended waveform.

**Table 65. SDn\_REF\_CLKn\_P and SDn\_REF\_CLKn\_N input clock requirements (SV<sub>DD</sub> = 0.9V/1.0 V)<sup>1</sup>**

Parameter	Symbol	Min	Typ	Max	Unit	Notes
11. Matching applies to rising edge for SDn_REF_CLKn_P and falling edge rate for SDn_REF_CLKn_N. It is measured using a 200 mV window centered on the median cross point where SDn_REF_CLKn_P rising meets SDn_REF_CLKn_N falling. The median cross point is used to calculate the voltage thresholds that the oscilloscope uses for the edge rate calculations. The rise edge rate of SDn_REF_CLKn_P must be compared to the fall edge rate of SDn_REF_CLKn_N, the maximum allowed difference should not exceed 20% of the slowest edge rate. See <a href="#">Figure 35</a> .						

This table lists the AC requirements for SerDes reference clocks for protocols running at data rates greater than 8 Gb/s.

This includes XFI (10.3125 Gb/s) SerDes reference clocks to be guaranteed by the customer's application design.

### 3.16.3 SerDes transmitter and receiver reference circuits

This figure shows the reference circuits for SerDes data lane's transmitter and receiver.

**Figure 36. SerDes transmitter and receiver reference circuits**

The DC and AC specifications of the SerDes data lanes are defined in each interface protocol section below based on the application usage:

- [PCI Express](#)
- [Serial ATA \(SATA\) interface](#)
- [SGMII interface](#)
- [QSGMII interface](#)
- [XFI interface](#)

Note that an external AC-coupling capacitor is required for the above serial transmission protocols with the capacitor value defined in the specification of each protocol section.

### 3.16.4 PCI Express

This section describes the clocking dependencies, as well as the DC and AC electrical specifications for the PCI Express bus.

#### 3.16.4.1 Clocking dependencies

The ports on the two ends of a link must transmit data at a rate that is within 600 ppm of each other at all times. This is specified to allow bit rate clock sources with a  $\pm 300$  ppm tolerance.

#### 3.16.4.2 PCI Express clocking requirements for SD2\_REF\_CLK $n$ \_P and SD2\_REF\_CLK $n$ \_N

SerDes 2 (SD2\_REF\_CLK[1:2]\_P and SD2\_REF\_CLK[1:2]\_N) may be used for various SerDes PCI Express configurations based on the RCW configuration field SRDS\_PRTCL. PCI Express is supported on SerDes 2.

For more information on these specifications, see [SerDes reference clocks](#).

#### 3.16.4.3 PCI Express DC physical layer specifications

This section contains the DC specifications for the physical layer of PCI Express on this chip.

##### 3.16.4.3.1 PCI Express DC physical layer transmitter specifications

This section discusses the PCI Express DC physical layer transmitter specifications for 2.5 GT/s, 5 GT/s, and 8 GT/s.

This table defines the PCI Express 2.0 (2.5 GT/s) DC specifications for the differential output at all transmitters. The parameters are specified at the component pins.

**Table 67. PCI Express 2.0 (2.5 GT/s) differential transmitter output DC specifications ( $XV_{DD} = 1.35\text{ V}$ )<sup>1</sup>**

Parameter	Symbol	Min	Typical	Max	Units	Notes
Full swing transmitter voltage with no TX Eq	$V_{TX-FS-NO-EQ}$	800	—	1300	mVp-p	See Note 1.
Reduced swing transmitter voltage with no TX Eq	$V_{TX-RS-NO-EQ}$	400	—	1300	mV	See Note 1.
De-emphasized differential output voltage (ratio)	$V_{TX-DE-RATIO-3.5dB}$	3.0	3.5	4.0	dB	—
De-emphasized differential output voltage (ratio)	$V_{TX-DE-RATIO-6.0dB}$	5.5	6.0	6.5	dB	—
Minimum swing during EIEOS for full swing	$V_{TX-EIEOS-FS}$	250	—	—	mVp-p	See Note 2
Minimum swing during EIEOS for reduced swing	$V_{TX-EIEOS-RS}$	232	—	—	mVp-p	See Note 2
DC differential transmitter impedance	$Z_{TX-DIFF-DC}$	80	100	120	$\Omega$	Transmitter DC differential mode low impedance
Transmitter DC Impedance	$Z_{TX-DC}$	40	50	60	$\Omega$	Required transmitter D+ as well as D- DC impedance during all states

**Notes:**

1. Voltage measurements for  $V_{TX-FS-NO-EQ}$  and  $V_{TX-RS-NO-EQ}$  are made using the 64-zeroes/64-ones pattern in the compliance pattern.
2. Voltage limits comprehend both full swing and reduced swing modes. The transmitter must reject any changes that would violate this specification. The maximum level is covered in the  $V_{TX-FS-NO-EQ}$  measurement which represents the maximum peak voltage the transmitter can drive. The  $V_{TX-EIEOS-FS}$  and  $V_{TX-EIEOS-RS}$  voltage limits are imposed to guarantee the EIEOS threshold of 175 mV<sub>P-P</sub> at the receiver pin. This parameter is measured using the actual EIEOS pattern that is part of the compliance pattern and then removing the ISI contribution of the breakout channel.
3. For recommended operating conditions, see [Table 3](#).

**3.16.4.3.2 PCI Express DC physical layer receiver specifications**

This section discusses the PCI Express DC physical layer receiver specifications for 2.5 GT/s, 5 GT/s, and 8 GT/s.

This table defines the DC specifications for the PCI Express 2.0 (2.5 GT/s) differential input at all receivers. The parameters are specified at the component pins.

### 3.16.4.4 PCI Express AC physical layer specifications

This section describes the AC specifications for the physical layer of PCI Express on this device.

#### 3.16.4.4.1 PCI Express AC physical layer transmitter specifications

This section describes the PCI Express AC physical layer transmitter specifications for 2.5 GT/s, 5 GT/s, and 8 GT/s.

This table defines the PCI Express 2.0 (2.5 GT/s) AC specifications for the differential output at all transmitters. The parameters are specified at the component pins. The AC timing specifications do not include RefClk jitter.

**Table 73. PCI Express 2.0 (2.5 GT/s) differential transmitter output AC specifications<sup>4</sup>**

Parameter	Symbol	Min	Typ	Max	Units	Notes
Unit interval	UI	399.88	400	400.12	ps	Each UI is 400 ps ± 300 ppm. UI does not account for spread-spectrum clock dictated variations.
Minimum transmitter eye width	T <sub>TX-EYE</sub>	0.75	-	-	UI	The maximum transmitter jitter can be derived as T <sub>TX-MAX-JITTER</sub> = 1 - T <sub>TX-EYE</sub> = 0.25 UI. Does not include spread-spectrum or RefCLK jitter. Includes device random jitter at 10 <sup>-12</sup> . See Notes 1 and 2.
Maximum time between the jitter median and maximum deviation from the median	T <sub>TX-EYE-MEDIAN-to- MAX-JITTER</sub>	-	-	0.125	UI	Jitter is defined as the measurement variation of the crossing points (V <sub>TX-DIFFP-P</sub> = 0 V) in relation to a recovered transmitter UI. A recovered transmitter UI is calculated over 3500 consecutive unit intervals of sample data. Jitter is measured using all edges of the 250 consecutive UI in the center of the 3500 UI used for calculating the transmitter UI. See Notes 1 and 2.
AC coupling capacitor	C <sub>TX</sub>	75	-	200	nF	All transmitters must be AC coupled. The AC coupling is required either within the media or within the transmitting component itself. See Note 3.

**Table 73. PCI Express 2.0 (2.5 GT/s) differential transmitter output AC specifications<sup>4</sup>**  
(continued)

Parameter	Symbol	Min	Typ	Max	Units	Notes
<b>Notes:</b> 1. Specified at the measurement point into a timing and voltage test load as shown in <a href="#">Figure 38</a> and measured over any 250 consecutive transmitter UIs. 2. A $T_{TX-EYE} = 0.75$ UI provides for a total sum of deterministic and random jitter budget of $T_{TX-JITTER-MAX} = 0.25$ UI for the transmitter collected over any 250 consecutive transmitter UIs. The $T_{TX-EYE-MEDIAN-to-MAX-JITTER}$ median is less than half of the total transmitter jitter budget collected over any 250 consecutive transmitter UIs. It must be noted that the median is not the same as the mean. The jitter median describes the point in time where the number of jitter points on either side is approximately equal as opposed to the averaged time value. 3. The chip's SerDes transmitter does not have $C_{TX}$ built-in. An external AC coupling capacitor is required. 4. For recommended operating conditions, see <a href="#">Table 3</a> .						

This table defines the PCI Express 2.0 (5 GT/s) AC specifications for the differential output at all transmitters. The parameters are specified at the component pins. The AC timing specifications do not include RefClk jitter.

**Table 74. PCI Express 2.0 (5 GT/s) differential transmitter output AC specifications<sup>3</sup>**

Parameter	Symbol	Min	Typ	Max	Units	Notes
Unit Interval	UI	199.94	200.00	200.06	ps	Each UI is 200 ps $\pm$ 300 ppm. UI does not account for spread-spectrum clock dictated variations.
Minimum transmitter eye width	$T_{TX-EYE}$	0.75	-	-	UI	The maximum transmitter jitter can be derived as: $T_{TX-MAX-JITTER} = 1 - T_{TX-EYE} = 0.25$ UI. See Note 1.
Transmitter RMS deterministic jitter > 1.5 MHz	$T_{TX-HF-DJ-DD}$	-	-	0.15	ps	-
Transmitter RMS deterministic jitter < 1.5 MHz	$T_{TX-LF-RMS}$	-	3.0	-	ps	Reference input clock RMS jitter (< 1.5 MHz) at pin < 1 ps
AC coupling capacitor	$C_{TX}$	75	-	200	nF	All transmitters must be AC coupled. The AC coupling is required either within the media or within the transmitting component itself. See Note 2.
<b>Notes:</b> 1. Specified at the measurement point into a timing and voltage test load as shown in <a href="#">Figure 38</a> and measured over any 250 consecutive transmitter UIs. 2. The chip's SerDes transmitter does not have $C_{TX}$ built-in. An external AC coupling capacitor is required. 3. For recommended operating conditions, see <a href="#">Table 3</a> .						

This table defines the PCI Express 3.0 (8 GT/s) AC specifications for the differential output at all transmitters. The parameters are specified at the component pins. The AC timing specifications do not include RefClk jitter.

**Table 75. PCI Express 3.0 (8 GT/s) differential transmitter output AC specifications<sup>4</sup>**

Parameter	Symbol	Min	Typ	Max	Units	Notes
Unit Interval	UI	124.9625	125.00	125.0375	ps	Each UI is 125 ps $\pm$ 300 ppm. UI does not account for spread-spectrum clock dictated variations.
Transmitter uncorrelated total jitter	T <sub>TX-UTJ</sub>	—	—	31.25	ps p-p	—
Transmitter uncorrelated deterministic jitter	T <sub>TX-UDJ-DD</sub>	—	—	12	ps p-p	—
Total uncorrelated pulse width jitter (PWJ)	T <sub>TX-UPW-TJ</sub>	—	—	24	ps p-p	See Note 1, 2
Deterministic data dependent jitter (DjDD) uncorrelated pulse width jitter (PWJ)	T <sub>TX-UPW-DJDD</sub>	—	—	10	ps p-p	See Note 1, 2
Data dependent jitter	T <sub>TX-DDJ</sub>	—	—	18	ps p-p	See Note 2
AC coupling capacitor	C <sub>TX</sub>	176	—	265	nF	All transmitters must be AC coupled. The AC coupling is required either within the media or within the transmitting component itself. See Note 3.

**Notes:**

1. PWJ parameters shall be measured after data dependent jitter (DDJ) separation.
2. Measured with optimized preset value after de-embedding to transmitter pin.
3. The chip's SerDes transmitter does not have C<sub>TX</sub> built-in. An external AC coupling capacitor is required.
4. For recommended operating conditions, see [Table 3](#).

**3.16.4.4.2 PCI Express AC physical layer receiver specifications**

This section discusses the PCI Express AC physical layer receiver specifications for 2.5 GT/s, 5 GT/s, and 8 GT/s.

This table defines the AC specifications for the PCI Express 2.0 (2.5 GT/s) differential input at all receivers. The parameters are specified at the component pins. The AC timing specifications do not include RefClk jitter.

**Table 76. PCI Express 2.0 (2.5 GT/s) differential receiver input AC specifications<sup>4</sup>**

Parameter	Symbol	Min	Typ	Max	Units	Notes
Unit Interval	UI	399.88	400.00	400.12	ps	Each UI is 400 ps $\pm$ 300 ppm. UI does not account for spread-spectrum clock dictated variations.
Minimum receiver eye width	T <sub>RX-EYE</sub>	0.4	-	-	UI	The maximum interconnect media and transmitter jitter that can be tolerated by the receiver can be derived as T <sub>RX-MAX-JITTER</sub> = 1 - T <sub>RX-EYE</sub> = 0.6 UI. See Notes 1 and 2.

Table continues on the next page...

**Table 76. PCI Express 2.0 (2.5 GT/s) differential receiver input AC specifications<sup>4</sup>**  
(continued)

Parameter	Symbol	Min	Typ	Max	Units	Notes
Maximum time between the jitter median and maximum deviation from the median.	$T_{RX-EYE-MEDIAN-to-MAX-JITTER}$	-	-	0.3	UI	Jitter is defined as the measurement variation of the crossing points ( $V_{RX-DIFFp-p} = 0$ V) in relation to a recovered transmitter UI. A recovered transmitter UI is calculated over 3500 consecutive unit intervals of sample data. Jitter is measured using all edges of the 250 consecutive UI in the center of the 3500 UI used for calculating the transmitter UI. See Notes 1, 2 and 3.
<b>Notes:</b> 1. Specified at the measurement point and measured over any 250 consecutive UIs. The test load in <a href="#">Figure 38</a> must be used as the receiver device when taking measurements. If the clocks to the receiver and transmitter are not derived from the same reference clock, the transmitter UI recovered from 3500 consecutive UI must be used as a reference for the eye diagram. 2. A $T_{RX-EYE} = 0.40$ UI provides for a total sum of 0.60 UI deterministic and random jitter budget for the transmitter and interconnect collected any 250 consecutive UIs. The $T_{RX-EYE-MEDIAN-to-MAX-JITTER}$ specification ensures a jitter distribution in which the median and the maximum deviation from the median is less than half of the total. UI jitter budget collected over any 250 consecutive transmitter UIs. It must be noted that the median is not the same as the mean. The jitter median describes the point in time where the number of jitter points on either side is approximately equal as opposed to the averaged time value. If the clocks to the receiver and transmitter are not derived from the same reference clock, the transmitter UI recovered from 3500 consecutive UI must be used as the reference for the eye diagram. 3. It is recommended that the recovered transmitter UI is calculated using all edges in the 3500 consecutive UI interval with a fit algorithm using a minimization merit function. Least squares and median deviation fits have worked well with experimental and simulated data. 4. For recommended operating conditions, see <a href="#">Table 3</a> .						

This table defines the AC specifications for the PCI Express 2.0 (5 GT/s) differential input at all receivers. The parameters are specified at the component pins. The AC timing specifications do not include RefClk jitter.

**Table 77. PCI Express 2.0 (5 GT/s) differential receiver input AC specifications<sup>1</sup>**

Parameter	Symbol	Min	Typ	Max	Units	Notes
Unit Interval	UI	199.40	200.00	200.06	ps	Each UI is 200 ps $\pm$ 300 ppm. UI does not account for spread-spectrum clock dictated variations.
Max receiver inherent timing error	$T_{RX-TJ-CC}$	-	-	0.4	UI	The maximum inherent total timing error for common RefClk receiver architecture
Max receiver inherent deterministic timing error	$T_{RX-DJ-DD-CC}$	-	-	0.30	UI	The maximum inherent deterministic timing error for common RefClk receiver architecture
<b>Note:</b> 1. For recommended operating conditions, see <a href="#">Table 3</a> .						

## Electrical characteristics

This table defines the AC specifications for the PCI Express 3.0 (8 GT/s) differential input at all receivers. The parameters are specified at the component pins. The AC timing specifications do not include RefClk jitter.

**Table 78. PCI Express 3.0 (8 GT/s) differential receiver input AC specifications<sup>5</sup>**

Parameter	Symbol	Min	Typ	Max	Units	Notes
Unit Interval	UI	124.9625	125.00	125.0375	ps	Each UI is 125 ps $\pm$ 300 ppm. UI does not account for spread-spectrum clock dictated variations. See Note 1.
Eye Width at TP2P	$T_{RX-SV-8G}$	0.3	—	0.35	UI	See Note 1
Differential mode interference	$V_{RX-SV-DIFF-8G}$	14	—	—	mV	Frequency = 2.1GHz. See Note 2.
Sinusoidal Jitter at 100 MHz	$T_{RX-SV-SJ-8G}$	—	—	0.1	UI p-p	Fixed at 100 MHz. See Note 3.
Random Jitter	$T_{RX-SV-RJ-8G}$	—	—	2.0	ps RMS	Random jitter spectrally flat before filtering. See Note 4.

**Note:**

1.  $T_{RX-SV-8G}$  is referenced to TP2P and obtained after post processing data captured at TP2.  $T_{RX-SV-8G}$  includes the effects of applying the behavioral receiver model and receiver behavioral equalization.
2.  $V_{RX-SV-DIFF-8G}$  voltage may need to be adjusted over a wide range for the different loss calibration channels.
3. The sinusoidal jitter in the total jitter tolerance may have any amplitude and frequency as shown in Figure 37.
4. Random jitter (Rj) is applied over the following range: The low frequency limit may be between 1.5 and 10 MHz, and the upper limit is 1.0 GHz. See Figure 37 for details. Rj may be adjusted to meet the 0.3 UI value for  $T_{RX-SV-8G}$ .
5. For recommended operating conditions, see Table 3.

**Figure 37. Swept sinusoidal jitter mask**

### 3.16.4.5 Test and measurement load

The AC timing and voltage parameters must be verified at the measurement point. The package pins of the device must be connected to the test/measurement load within 0.2 inches of that load, as shown in the following figure.

#### NOTE

The allowance of the measurement point to be within 0.2 inches of the package pins is meant to acknowledge that package/board routing may benefit from D+ and D- not being exactly matched in length at the package pin boundary. If the vendor does not explicitly state where the measurement point is located, the measurement point is assumed to be the D+ and D- package pins.

### 3.16.5.2 SATA AC timing specifications

This section describes the SATA AC timing specifications.

### 3.16.5.2.1 AC requirements for SATA REF\_CLK

This table provides the AC requirements for the SATA reference clock. These requirements must be guaranteed by the customer's application design.

**Table 85. SATA reference clock input requirements<sup>6</sup>**

Parameter	Symbol	Min	Typ	Max	Unit	Notes
SDn_REF_CLK1_P/SDn_REF_CLK1_N frequency range	t <sub>CLK_REF</sub>	—	100/125	—	MHz	1
SDn_REF_CLK1_P/SDn_REF_CLK1_N clock frequency tolerance	t <sub>CLK_TOL</sub>	-350	—	+350	ppm	—
SDn_REF_CLK1_P/SDn_REF_CLK1_N reference clock duty cycle	t <sub>CLK_DUTY</sub>	40	50	60	%	5
SDn_REF_CLK1_P/SDn_REF_CLK1_N cycle-to-cycle clock jitter (period jitter)	t <sub>CLK_CJ</sub>	—	—	100	ps	2
SDn_REF_CLK1_P/SDn_REF_CLK1_N total reference clock jitter, phase jitter (peak-to-peak)	t <sub>CLK_PJ</sub>	-50	—	+50	ps	2, 3, 4

**Notes:**

- Caution:** Only 100 and 125 MHz have been tested. In-between values do not work correctly with the rest of the system.
- At RefClk input.
- In a frequency band from 150 kHz to 15 MHz at BER of 10<sup>-12</sup>.
- Total peak-to-peak deterministic jitter must be less than or equal to 50 ps.
- Measurement taken from differential waveform.
- For recommended operating conditions, see [Table 3](#).

### 3.16.5.2.2 AC transmitter output characteristics

This table provides the differential transmitter output AC characteristics for the SATA interface at Gen 1i/1m or 1.5 Gbits/s transmission. The AC timing specifications do not include RefClk jitter.

### 3.16.6 SGMII interface

Each SGMII port features a 4-wire AC-coupled serial link from the SerDes interface of the chip, as shown in [Figure 39](#), where  $C_{TX}$  is the external (on board) AC-coupled capacitor. Each SerDes transmitter differential pair features 100  $\Omega$  output impedance. Each input of the SerDes receiver differential pair features 50  $\Omega$  on-die termination to  $XGND_n$ . The reference circuit of the SerDes transmitter and receiver is shown in [Figure 36](#).

#### 3.16.6.1 SGMII clocking requirements for $SD_n\_REF\_CLK1\_P$ and $SD_n\_REF\_CLK1\_N$

When operating in SGMII mode, the  $EC_n\_GTX\_CLK125$  clock is not required for this port. Instead, a SerDes reference clock is required on  $SD1\_REF\_CLK[1:2]_P$  and  $SD1\_REF\_CLK[1:2]_N$  pins. SerDes lanes may be used for SerDes SGMII configurations based on the RCW Configuration field  $SRDS\_PRTCL$ .

For more information on these specifications, see [SerDes reference clocks](#).

#### 3.16.6.2 SGMII DC electrical characteristics

This section describes the electrical characteristics for the SGMII interface.

##### 3.16.6.2.1 SGMII and SGMII 2.5 G transmit DC specifications

This table describes the SGMII SerDes transmitter AC-coupled DC electrical characteristics. Transmitter DC characteristics are measured at the transmitter outputs ( $SD_n\_TXn\_P$  and  $SD_n\_TXn\_N$ ) as shown in [Figure 40](#).

<b>Notes:</b>						
1. Each UI is 800 ps $\pm$ 100 ppm or 320 ps $\pm$ 100 ppm.						
2. See <a href="#">Figure 42</a> for single frequency sinusoidal jitter measurements.						
3. The external AC coupling capacitor is required. It is recommended that it be placed near the device transmitter output.						
4. For recommended operating conditions, see <a href="#">Table 3</a> .						

### 3.16.6.3.2 SGMII AC measurement details

Transmitter and receiver AC characteristics are measured at the transmitter outputs (SDn\_TXn\_P and SDn\_TXn\_N) or at the receiver inputs (SDn\_RXn\_P and SDn\_RXn\_N) respectively, as shown in this figure.

**Figure 41. SGMII AC test/measurement load**

### 3.16.6.3.3 SGMII and SGMII 2.5 G receiver AC timing specifications

This table provides the SGMII and SGMII 2.5 G receiver AC timing specifications. The AC timing specifications do not include RefClk jitter. Source synchronous clocking is not supported. Clock is recovered from the data.

Unit Interval: 3.125 GBaud (2.5G SGMII)	UI	320 - 100 ppm	320	320 + 100 ppm	ps	1

**Notes:**

1. Measured at receiver.
2. Total jitter is composed of three components: deterministic jitter, random jitter, and single frequency sinusoidal jitter. The sinusoidal jitter may have any amplitude and frequency in the unshaded region of [Figure 1](#). The sinusoidal jitter component is included to ensure margin for low frequency jitter, wander, noise, crosstalk, and other variable system effects.
3. For recommended operating conditions, see [Table 3](#).

The sinusoidal jitter in the total jitter tolerance may have any amplitude and frequency in the unshaded region of this figure.

Unit Interval	UI	-	96.96	-	ps	-
Receiver baud rate	$R_{BAUD}$	10.3125-100ppm	10.3125	10.3125+100ppm	Gb/s	-
Total non-EQJ jitter	$T_{NON-EQJ}$	-	-	0.45	UI p-p	1
Total jitter tolerance	$T_J$	-	-	0.65	UI p-p	1, 2
<p>1. The total jitter (TJ) consists of Random Jitter (RJ), Duty Cycle Distortion (DCD), Periodic Jitter (PJ), and Inter-Symbol Interference (ISI). Non-EQJ jitter can include duty cycle distortion (DCD), random jitter (RJ), and periodic jitter (PJ). Non-EQJ jitter is uncorrelated to the primary data stream with exception of the DCD and so cannot be equalized by the receiver under test. It can exhibit a wide spectrum. Non - EQJ = TJ - ISI = RJ + DCD + PJ.</p> <p>2. The XFI channel has a loss budget of 9.6 dB @5.5GHz. The channel loss including connector @ 5.5GHz is 6dB. The channel crosstalk and reflection margin is 3.6dB. Manual tuning of TX Equalization and amplitude will be required for performance optimization.</p>						

This figure shows the sinusoidal jitter tolerance of XFI receiver.

1. For recommended operating conditions, see [Table 3](#).  
2. The min  $V_{IL}$  and max  $V_{IH}$  values are based on the respective min and max  $DV_{IN}$  values found in [Table 3](#).  
3. The output voltage (open drain or open collector) condition = 3 mA sink current.  
4. See the chip reference manual for information about the digital filter used.  
5. I/O pins obstruct the SDA and SCL lines if  $DV_{DD}$  is switched off.

### 3.17.2 I<sup>2</sup>C AC timing specifications

This table provides the AC timing specifications for the I<sup>2</sup>C interface.

**Table 116. I<sup>2</sup>C AC timing specifications<sup>1</sup>**

Parameter	Symbol	Min	Max	Unit	Notes
SCL clock frequency	$f_{I2C}$	0.0	400.0	kHz	-
Low period of the SCL clock	$t_{I2CL}$	1.3	-	$\mu\text{s}$	-
High period of the SCL clock	$t_{I2CH}$	0.6	-	$\mu\text{s}$	-
Setup time for a repeated START condition	$t_{I2SVKH}$	0.6	-	$\mu\text{s}$	-
Hold time (repeated) START condition (after this period, the first clock pulse is generated)	$t_{I2SXKL}$	0.6	-	$\mu\text{s}$	-
Data setup time	$t_{I2DVKH}$	100.0	-	ns	-
Data input hold time (CBUS compatible masters, I <sup>2</sup> C bus devices)	$t_{I2DXKL}$	0.0	-	$\mu\text{s}$	As a transmitter, the chip provides a delay time of at least 300 ns for the SDA signal (referred to the $V_{IH\text{min}}$ of the SCL signal) to bridge the undefined region of the falling edge of SCL to avoid unintended generation

Table continues on the next page...

Parameter	Symbol	Min	Max	Unit	Notes
					of a START or STOP condition. When the chip acts as the I <sup>2</sup> C bus master while transmitting, it drives both SCL and SDA. As long as the load on SCL and SDA are balanced, the chip does not generate an unintended START or STOP condition. Therefore, the 300 ns SDA output delay time is not a concern.
Data output delay time	$t_{I2OVKL}$	-	0.9	$\mu\text{s}$	The maximum $t_{I2OVKL}$ has to be met only if the device does not stretch the LOW period ( $t_{I2CL}$ ) of the SCL signal.
Setup time for STOP condition	$t_{I2PVKH}$	0.6	-	$\mu\text{s}$	-
Bus free time between a STOP and START condition	$t_{I2KHDX}$	1.3	-	$\mu\text{s}$	-
Noise margin at the LOW level for each connected device (including hysteresis)	$V_{NL}$	0.1 x DVDD	-	V	-
Noise margin at the HIGH level for each connected device (including hysteresis)	$V_{NH}$	0.2 x DVDD	-	V	-
Capacitive load for each bus line	$C_b$	-	400.0	pF	-
1. The symbols used for timing specifications herein follow these patterns: $t_{(\text{first two letters of functional block})(\text{signal})(\text{state})(\text{reference})(\text{state})}$ for inputs and $t_{(\text{first two letters of functional block})(\text{reference})(\text{state})(\text{signal})(\text{state})}$ for outputs. For example, $t_{I2DVKH}$ symbolizes I <sup>2</sup> C timing (I2) with respect to the time data input signals (D) reaching the valid state (V) relative to the I <sup>2</sup> C clock reference (K) going to the high (H) state or setup time. Also, $t_{I2SXKL}$ symbolizes I <sup>2</sup> C timing (I2) for the time that the data with respect to the START condition (S) went invalid (X) relative to the I <sup>2</sup> C clock reference (K) going to the low (L) state or hold time. Also, $t_{I2PVKH}$ symbolizes I <sup>2</sup> C timing (I2) for the time that the data with respect to the STOP condition (P) reaches the valid state (V) relative to the I <sup>2</sup> C clock reference (K) going to the high (H) state or setup time.

## 3.18 Integrated Flash Controller

This section describes the DC and AC electrical specifications for the integrated flash controller.

### 3.18.1 Integrated Flash Controller DC electrical characteristics

Table below provides the DC electrical characteristics for the integrated flash controller when operating at  $OV_{DD} = 1.8\text{ V}$ .

Table 117. Integrated Flash Controller DC electrical characteristics (1.8 V)<sup>3</sup>

Parameter	Symbol	Min	Max	Unit	Note
Input high voltage	$V_{IH}$	$0.7 \times OV_{DD}$	-	V	1
Input low voltage	$V_{IL}$	-	$0.3 \times OV_{DD}$	V	1
Input current ( $V_{IN} = 0\text{ V}$ or $V_{IN} = OV_{DD}$ )	$I_{IN}$	-	$\pm 50$	$\mu\text{A}$	2
Output high voltage ( $OV_{DD} = \text{min}$ , $I_{OH} = -0.5\text{ mA}$ )	$V_{OH}$	1.6	-	V	-
Output low voltage ( $OV_{DD} = \text{min}$ , $I_{OL} = 0.5\text{ mA}$ )	$V_{OL}$	-	0.32	V	-

**NOTE:**

1. The min  $V_{IL}$  and max  $V_{IH}$  values are based on the respective min and max  $OV_{IN}$  values found in [Table 3](#).
2. The symbol  $V_{IN}$ , in this case, represents the  $OV_{IN}$  symbol referenced in [Table 3](#).
3. For recommended operating conditions, see [Table 3](#).

### 3.18.2 Integrated Flash Controller AC timing specifications

This section describes the AC timing specifications for the integrated flash controller.

#### 3.18.2.1 Test condition

The figure below provides the AC test load for the integrated flash controller.

Figure 47. Integrated Flash Controller AC test load

#### 3.18.2.2 IFC AC timing specifications (GPCM/GASIC)

The table below describes the input AC timing specifications for the IFC-GPCM and IFC-GASIC interface.

**Table 118. Integrated flash controller input timing specifications for GPCM and GASIC mode ( $OV_{DD} = 1.8 \, V$ )<sup>1</sup>**

Parameter	Symbol	Min	Max	Unit	Notes
Input setup	$t_{IBIVKH1}$	4	-	ns	-
Input hold	$t_{IBIXKH1}$	1	-	ns	-

**NOTE:**  
1. For recommended operating conditions, see [Table 3](#).

The figure below shows the input AC timing diagram for the IFC-GPCM, IFC-GASIC interface.

Figure 48. IFC-GPCM, IFC-GASIC input AC timing specifications

The table below describes the output AC timing specifications for the IFC-GPCM and IFC-GASIC interfaces.

**Table 119. Integrated flash controller IFC-GPCM and IFC-GASIC interface output timing specifications ( $OV_{DD} = 1.8\text{ V}$ )<sup>2</sup>**

Parameter	Symbol	Min	Max	Unit	Notes
IFC_CLK cycle time	$t_{IBK}$	10	-	ns	-
IFC_CLK duty cycle	$t_{IBKH}/t_{IBK}$	45	55	%	-
Output delay	$t_{IBKLOV1}$	-	1.5	ns	-
Output hold	$t_{IBKLOX}$	-	-2	ns	1
IFC_CLK[0] to IFC_CLK[m] skew	$t_{IBKSKEW}$	0	$\pm 75$	ps	-

**NOTE:**

1. The output hold is negative. This means that output transition happens earlier than the falling edge of IFC\_CLK.
2. For recommended operating conditions, see [Table 3](#).

The figure below shows the output AC timing diagram for the IFC-GPCM, IFC-GASIC interface.

**Figure 49. IFC-GPCM, IFC-GASIC signals**

### 3.18.2.3 IFC AC timing specifications (NOR)

The table below describes the input timing specifications for the IFC-NOR interface.

**Table 120. Integrated flash controller input timing specifications for NOR mode ( $OV_{DD} = 1.8\text{ V}$ )<sup>2</sup>**

Parameter	Symbol	Min	Max	Unit	Notes
Input setup	$t_{IBIVKH2}$	$(2 \times t_{IP\_CLK}) + 2$	-	ns	1
Input hold	$t_{IBIXKH2}$	$(1 \times t_{IP\_CLK}) + 1$	-	ns	1

**Notes:**

1.  $t_{IP\_CLK}$  is the period of ip clock (not the IFC\_CLK) on which IFC is running.
2. For recommended operating conditions, see [Table 3](#).

The figure below shows the AC input timing diagram for input signals for the IFC-NOR interface. Here TRAD is a programmable delay parameter. See the IFC section of the chip reference manual for more information.

**Figure 50. IFC-NOR interface input AC timings**

The table below describes the output AC timing specifications of IFC-NOR interface.

**Table 121. Integrated flash controller IFC-NOR interface output timing specifications ( $OV_{DD} = 1.8\text{ V}$ )<sup>2</sup>**

Parameter	Symbol	Min	Max	Unit	Notes
Output delay	$t_{BKLOV2}$	-	$\pm 1.5$	ns	1
<b>NOTE:</b> 1. This effectively means that a signal change may appear anywhere within $\pm t_{BKLOV2}$ (max) duration, from the point where it's expected to change. 2. For recommended operating conditions, see <a href="#">Table 3</a> .					

The figure below shows the AC timing diagram for IFC-NOR interface output signals. The timing specs have been illustrated here by taking timings between two signals, CS\_B and OE\_B as an example. In a read operation, OE\_B is supposed to change the TACO (a programmable delay; see the IFC section of the chip reference manual for more information) time after CS\_B. Because of the skew between the signals, OE\_B may change anywhere within the window of time defined by  $t_{BKLOV2}$ . This concept applies to other IFC-NOR interface output signals as well. The diagram is an example that shows the skew between any two chronological toggling signals as per the protocol. The list of IFC-NOR output signals is as follows: NRALE, NRAVD\_B, NRWE\_B, NROE\_B, CS\_B, AD (Address phase).

Figure 51. IFC-NOR interface output AC timings

### 3.18.2.4 IFC AC timing specifications (NAND)

The table below describes the input timing specifications of the IFC-NAND interface.

**Table 122. Integrated flash controller input timing specifications for NAND mode ( $OV_{DD} = 1.8\text{ V}$ )<sup>2</sup>**

Parameter	Symbol	Min	Max	Unit	Notes
Input setup	$t_{BIVKH3}$	$(2 \times t_{IP\_CLK}) + 2$	-	ns	1
Input hold	$t_{BIXKH3}$	1	-	ns	1
IFC_RB_B pulse width	$t_{BCH}$	2	-	$t_{IP\_CLK}$	1
<b>NOTE:</b> 1. $t_{IP\_CLK}$ is the period of ip clock on which IFC is running. 2. For recommended operating conditions, see <a href="#">Table 3</a> .					

The figure below shows the AC input timing diagram for input signals of IFC-NAND interface. Here TRAD is a programmable delay parameter. See the IFC section of the chip reference manual for more information.

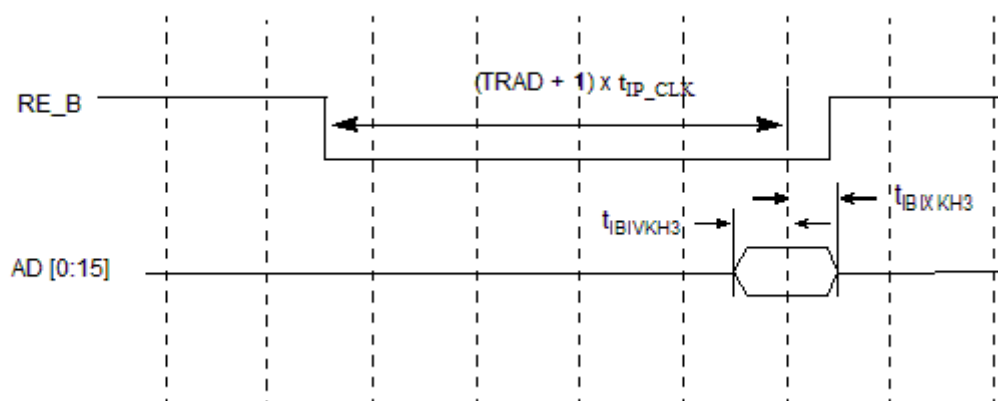

Figure 52. IFC-NAND interface input AC timings

NOTE

$t_{IP\_CLK}$  is the period of ip clock (not the IFC\_CLK) on which IFC is running.

The table below describes the output AC timing specifications for the IFC-NAND interface.

**Table 123. Integrated flash controller IFC-NAND interface output timing specifications**  
**(OV<sub>DD</sub> = 1.8 V)<sup>2</sup>**

Parameter	Symbol	Min	Max	Unit	Notes
Output delay	$t_{IBKLOV3}$	-	±1.5	ns	1
<b>NOTE:</b> 1. This effectively means that a signal change may appear anywhere within $t_{IBKLOV3}$ (min) to $t_{IBKLOV3}$ (max) duration, from the point where it's expected to change. 2. For recommended operating conditions, see <a href="#">Table 3</a> .					

The figure below shows the AC timing diagram for output signals of IFC-NAND interface. The timing specs are shown here by taking the timings between two signals, CS\_B and CLE as an example. CLE is supposed to change TCCST (a programmable delay; see the IFC section of the chip reference manual for more information) time after CS\_B. Because of the skew between the signals, CLE may change anywhere within window of time defined by  $t_{IBKLOV3}$ . This concept applies to other output signals of the IFC-NAND interface as well. The diagram is an example to show the skew between any two chronological toggling signals as per the protocol. The list of output signals is as follows: NDWE\_B, NDRE\_B, NDALE, WP\_B, NDCLE, CS\_B, AD.

### 3.19.2 JTAG AC timing specifications

This table provides the JTAG AC timing specifications as defined in [Figure 78](#), [Figure 79](#), [Figure 80](#), and [Figure 81](#).

**Table 127. JTAG AC timing specifications<sup>1</sup>**

Parameter	Symbol	Min	Max	Unit	Notes
JTAG external clock frequency of operation	$F_{JTG}$	0.0	33.3	MHz	-
JTAG external clock cycle time	$t_{JTG}$	30.0	-	ns	-
JTAG external clock pulse width measured at 1.4 V	$t_{JTKHKL}$	15.0	-	ns	-
JTAG external clock rise and fall times	$t_{JTGR}/t_{JTGF}$	0.0	2.0	ns	-
TRST_B assert time	$t_{TRST}$	25.0	-	ns	TRST_B is an asynchronous level sensitive signal. The setup time is for test purposes only.
Input setup times	$t_{JTDVKH}$	4.0	-	ns	TA_BB_TMP_DETECT pin requires 13.5ns input setup time for the board JTAG test to go through runTESTIdle.
Input hold times	$t_{JTDXKH}$	10.0	-	ns	-
Output valid times: boundary-scan data	$t_{JTKLDV}$	-	15.0	ns	All outputs are measured from the midpoint voltage of the falling edge of $t_{TCLK}$ to the midpoint of the signal in question. The output timings are measured at the pins. All output timings assume a purely resistive 50- $\Omega$ load. Time-of-flight delays must be added for trace lengths, vias, and connectors in the system.

					question. The output timings are measured at the pins. All output timings assume a purely resistive 50-Ω load. Time-of-flight delays must be added for trace lengths, vias, and connectors in the system.
Output hold times	t <sub>JTKLDX</sub>	0.0	-	ns	All outputs are measured from the midpoint voltage of the falling edge of t <sub>TCLK</sub> to the midpoint of the signal in question. The output timings are measured at the pins. All output timings assume a purely resistive 50-Ω load. Time-of-flight delays must be added for trace lengths, vias, and connectors in the system.
1. The symbols used for timing specifications follow these patterns: t <sub>(first two letters of functional block)(signal)(state)(reference)(state)</sub> for inputs and t <sub>(first two letters of functional block)(reference)(state)(signal)(state)</sub> for outputs. For example, t <sub>JTDVKH</sub> symbolizes JTAG device timing (JT) with respect to the time data input signals (D) reaching the valid state (V) relative to the tJTG clock reference (K) going to the high (H) state or setup time. Also, t <sub>JTDXKH</sub> symbolizes JTAG timing (JT) with respect to the time data input signals (D) reaching the invalid state (X) relative to the tJTG clock reference (K) going to the high (H) state. Note that, in general, the clock reference symbol representation is based on three letters representing the clock of a particular function. For rise and fall times, the latter convention is used with the appropriate letter: R (rise) or F (fall).

## 3.20 Quad serial peripheral interface (QuadSPI)

This section describes the DC and AC electrical characteristics for the QuadSPI interface.

### 3.20.1 QuadSPI DC electrical characteristics

This table provides the DC electrical characteristics for the QuadSPI interface operating at  $OV_{DD} = 1.8V$ .

**Table 128. QuadSPI DC electrical characteristics<sup>1</sup>**

Parameter	Symbol	Min	Max	Unit	Notes
Input high voltage	$V_{IH}$	$0.7 \times OV_{DD}$	-	V	2
Input low voltage	$V_{IL}$	-	$0.3 \times OV_{DD}$	V	2
Input current ( $0V \leq V_{IN} \leq OV_{DD}$ )	$I_{IN}$	-	$\pm 50$	$\mu A$	3
Output high voltage ( $OV_{DD} = \text{min}$ , $I_{OH} = -100 \mu A$ )	$V_{OH}$	$OV_{DD} - 0.2$	-	V	-
Output low voltage ( $OV_{DD} = \text{min}$ , $I_{OL} = 100 \mu A$ )	$V_{OL}$	-	0.2	V	-

1. For recommended operating conditions, see [Table 3](#).  
2. The min  $V_{IL}$  and max  $V_{IH}$  values are based on the respective min and max  $OV_{IN}$  values found in [Table 3](#).  
3. Note that the symbol  $OV_{IN}$  represents the input voltage of the supply referenced in the Recommended Operating Conditions table.

### 3.20.2 QuadSPI AC timing specifications

This section describes the QuadSPI timing specifications in both SDR and DDR modes. All data is based on a negative edge data launch from the device and a positive edge data capture, as shown in the timing figures in this section.

This table provides the QuadSPI input and output timing in SDR mode ( $MCR[DQS\_EN] = 0$ , regarding to the 1st sample point. See  $qSPI\_SMPR[xSDLY, xSPHS]$  in the corresponding chip reference manual for different sampling points). Note that  $T$  represents the clock period,  $j$  represents  $qSPI\_FLSHCR[TCSH]$ , and  $k$  depends on  $qSPI\_FLSHCR[TCSS]$ .

**Table 129. QuadSPI SDR mode input and output timing**

Parameter	Symbol	Min	Max	Unit
Clock rise/fall time	$T_{RISE}/T_{FALL}$	1.0	-	ns
CS output hold time	$t_{NIKHOX2}$	$-3.3 + j * T$	-	ns
CS output delay	$t_{NIKHOV2}$	$-3.0 + k * T$	-	ns

## 3.21 QUICC engine specifications

The rise/fall time on QUICC engine block input pins should not exceed 5 ns. This should be enforced especially on clock signals. Rise time refers to signal transitions from 10% to 90% of  $V_{DD}$ . Fall time refers to transitions from 90% to 10% of  $V_{DD}$ .

### 3.21.1 High-level data link control (HDLC) interface

This section describes the DC and AC electrical characteristics for the high-level data link control (HDLC) interface.

#### 3.21.1.1 HDLC DC electrical characteristics

This table provides the DC electrical characteristics for the HDLC and synchronous UART protocols when operating at  $DV_{DD} = 3.3 \, \text{V}$ .

**Table 132. HDLC and synchronous UART DC electrical characteristics ( $DV_{DD} = 3.3\text{ V}$ )<sup>1</sup>**

## 4 Hardware design considerations

### 4.1 Clock ranges

This table provides the clocking specifications for the processor core, platform, memory, and integrated flash controller.

**Table 147. Processor, platform, and memory clocking specifications**

Characteristic	Maximum processor core frequency						Unit	Notes
	1200 MHz		1400 MHz		1600 MHz			
	Min	Max	Min	Max	Min	Max		
Core cluster group PLL frequency	600	1200	600	1400	600	1600	MHz	1
Platform clock frequency	400	500	400	600	400	700	MHz	1
Memory bus clock frequency	650	800	650	900	650	1050	MHz	1, 2
IFC clock frequency	-	100	-	100	-	100	MHz	3
<p>1. <b>Caution:</b>The coherency domain clock to SYSCLK ratio and core to SYSCLK ratio settings must be chosen such that the resulting SYSCLK frequency, core frequency, coherency domain and platform clock frequency do not exceed their respective maximum or minimum operating frequencies.</p> <p>2. The memory bus clock speed is half the DDR4 data rate.</p> <p>3. The integrated flash controller (IFC) clock speed on IFC_CLK[0:1] is determined by the platform clock divided by the IFC ratio programmed in CCR[CLKDIV]. See the chip reference manual for more information.</p>								

## 4.2 Power supply design

For additional details on the power supply design, see AN5144, QorIQ LS1088A Design Checklist.

### 4.2.1 Voltage ID (VID) controllable supply

To guarantee performance and power specifications, a specific method of selecting the optimum voltage-level must be implemented when the chip is used. As part of the chip's boot process, software must read the VID efuse values stored in the Fuse Status register (FUSESR) and then configure the external voltage regulator based on this information. This method requires a point of load voltage regulator for each chip. When VID option is used, the  $V_{DD}$  supply should be separated from the SerDes 1.0 V supply  $SnV_{DD}$ . It is required in order to control the  $V_{DD}$  supply only.

#### NOTE

During the power-on reset process, the fuse values are read and stored in the FUSESR. It is expected that the chip's boot code reads the FUSESR value very early in the boot sequence and updates the regulator accordingly.

The default voltage regulator setting that is safe for the system to boot is the recommended operating  $V_{DD}$  at initial start-up of 1.025 V. It is highly recommended to select a regulator with a  $V_{out}$  range of at least 0.9 V to 1.1 V, with a resolution of 12.5 mV or better, when implementing a VID solution.

The table below lists the valid VID fuse values that will be programmed at the factory for this chip.

**Table 148. Fuse Status Register  
(DCFG\_CCSR\_FUSESR)**

Binary value of DA_V / DA_ALT_V	V <sub>DD</sub> voltage
00000b	1.025 V (default)
00001b	0.9875 V
00010b	0.9750 V
01000b	0.9000 V
10000b	1.0000 V
10001b	1.0125 V
10010b	1.0250 V
All other values	Reserved

For additional information on VID, see the chip reference manual.

## 5 Thermal

This table shows the thermal characteristics for the chip. Note that these numbers are based on design estimates and are preliminary.

**Table 149. Package thermal characteristics**

Junction-to-board thermal resistance determined per JEDEC JESD51-8. Thermal test board meets JEDEC specification for the specified package.</p> <p>3. Junction-to-case at the top of the package determined using MIL-STD 883 Method 1012.1. The cold plate temperature is used for the case temperature. Reported value includes the thermal resistance of the interface layer.</p> <p>4. Junction-to-lid-top thermal resistance is determined using the MIL-STD 883 Method 1012.1. However, instead of the cold plate, the lid top temperature is used here for the reference case temperature. Reported value does not include the thermal resistance layer between the package and cold plate.</p> <p>5. See <a href="#">Thermal management information</a> for additional details.</p>					

## 5.1 Recommended thermal model

Information about Flotherm models of the package or thermal data not available in this document can be obtained from your local NXP sales office.

## 5.2 Temperature diode

The chip has a temperature diode on the microprocessor that can be used in conjunction with other system temperature monitoring devices (such as Analog Devices, ADT7461A). These devices feature series resistance cancellation using three current measurements, where up to 1.5 k $\Omega$  of resistance can be automatically cancelled from the temperature result, allowing noise filtering and a more accurate reading.

The following are the specifications of the chip's on-board temperature diode:

Operating range: TBD

Ideality factor TBD; Temperature range TBD

## 5.3 Thermal management information

This section provides thermal management information for the flip-chip, plastic-ball, grid array (FC-PBGA) package for air-cooled applications. Proper thermal control design is primarily dependent on the system-level design—the heat sink, airflow, and thermal interface material.

The recommended attachment method to the heat sink is illustrated in [Figure 95](#). The heat sink should be attached to the printed-circuit board with the spring force centered over the die. This spring force should not exceed 15 pounds force.

**Figure 95. Package exploded, cross-sectional view-FC-PBGA (with lid)**

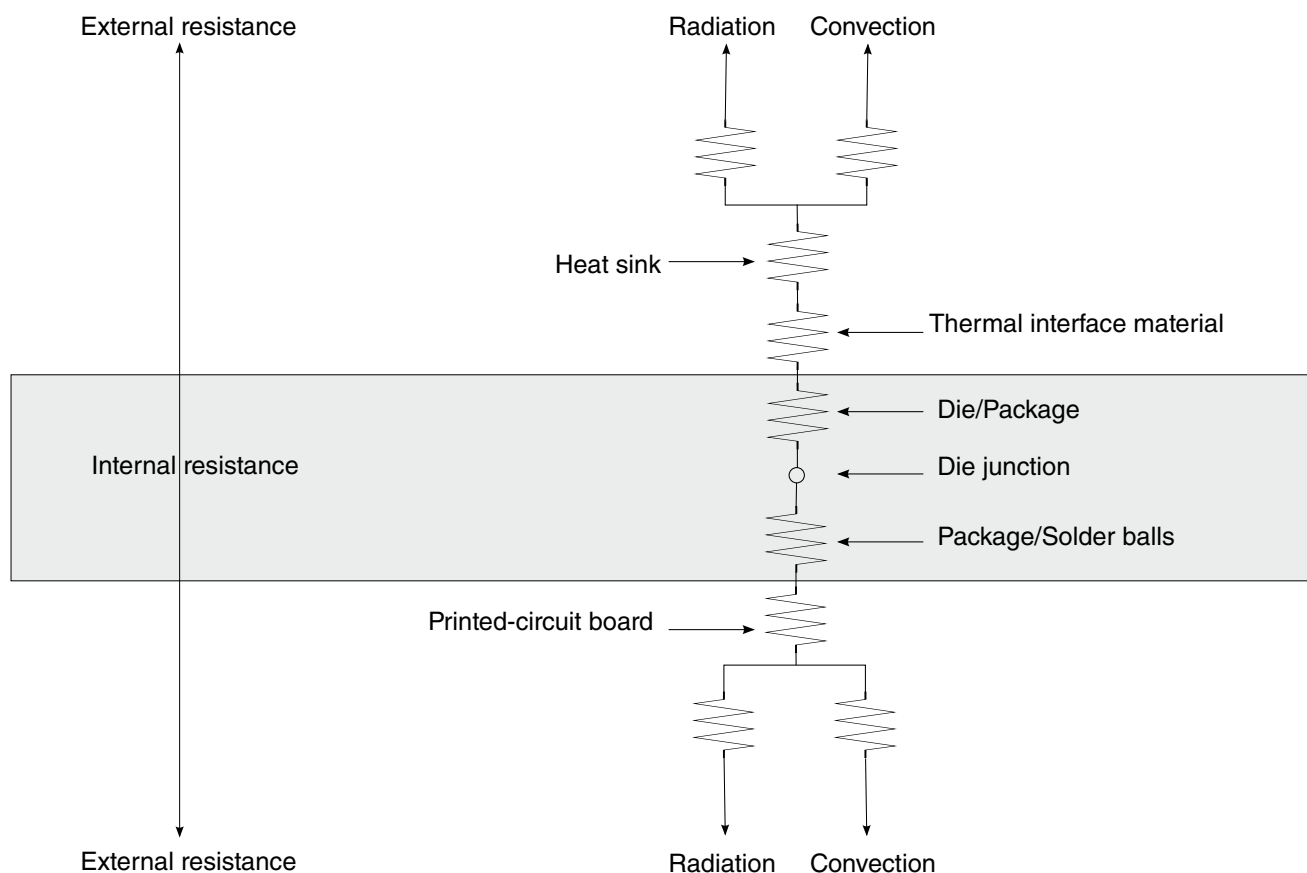

The system board designer can choose between several types of heat sinks to place on the device. There are several commercially available thermal interfaces to choose from in the industry. Ultimately, the final selection of an appropriate heat sink depends on many factors, such as thermal performance at a given air velocity, spatial volume, mass, attachment method, assembly, and cost.

### 5.3.1 Internal package conduction resistance

For the package, the intrinsic internal conduction thermal resistance paths are as follows:

- The die junction-to-case thermal resistance
- The die junction-to-board thermal resistance

This figure shows the primary heat transfer path for a package with an attached heat sink mounted to a printed-circuit board.

(Note the internal versus external package resistance)

**Figure 96. Package with heat sink mounted to a printed-circuit board**

The heat sink removes most of the heat from the device. Heat generated on the active side of the chip is conducted through the silicon and through the heat sink attach material (or thermal interface material), and finally to the heat sink. The junction-to-case thermal resistance is low enough that the heat sink attach material and heat sink thermal resistance are the dominant terms.

### 5.3.2 Thermal interface materials

A thermal interface material is required at the package-to-heat sink interface to minimize the thermal contact resistance. The performance of thermal interface materials improves with increasing contact pressure; this performance characteristic chart is generally provided by the thermal interface vendor. The recommended method of mounting heat sinks on the package is by means of a spring clip attachment to the printed-circuit board (see [Figure 95](#)).

The system board designer can choose among several types of commercially available thermal interface materials.

## 6 Package information

### 6.1 Package parameters for the FC-PBGA

The package parameters are as provided in the following list. The package type is 23 mm x 23 mm, 780 flip-chip, plastic-ball, grid array.

- Package outline - 23 mm x 23 mm
- Interconnects - 780
- Ball Pitch - 0.8 mm
- Ball Diameter (nominal) - 0.45 mm
- Ball Height (nominal) - 0.3 mm
- Solder Balls Composition - 96.5% Sn, 3% Ag, 0.5% Cu
- Module height (typical) - 2.31 mm (minimum), 2.46 mm (typical), 2.61 mm (maximum)

### 6.2 Mechanical dimensions of the FC-PBGA

1. All dimensions are in millimeters.
2. Dimensions and tolerances per ASME Y14.5M-1994.
3. Maximum solder ball diameter measured parallel to datum A.
4. Datum A, the seating plane, is determined by the spherical crowns of the solder balls.
5. Parallelism measurement shall exclude any effect of mark on top surface of package.
6. All dimensions are symmetric across the package center lines, unless dimensioned otherwise.
7. Pin 1 thru hole shall be centered within foot area.
8. 23.2 mm maximum package assembly (lid + laminate) X and Y.

## 7 Security fuse processor

This chip implements trust architecture 3.0, which supports capabilities such as secure boot. Use of the trust architecture features is dependent on programming fuses in the Security Fuse Processor (SFP). The details of the trust architecture and SFP can be found in the chip reference manual.

To program SFP fuses, the user is required to supply 1.8 V to the TA\_PROG\_SFP pin per [Power sequencing](#). TA\_PROG\_SFP should only be powered for the duration of the fuse programming cycle, with a per device limit of two fuse programming cycles. All other times, TA\_PROG\_SFP should be connected to GND. The sequencing requirements for raising and lowering TA\_PROG\_SFP are shown in [Power sequencing](#). To ensure device reliability, fuse programming must be performed within the recommended fuse programming temperature range per [Table 3](#).

### NOTE

Users not implementing the QorIQ platform's trust architecture features should connect TA\_PROG\_SFP to GND.

Компания «Life Electronics» занимается поставками электронных компонентов импортного и отечественного производства от производителей и со складов крупных дистрибьюторов Европы, Америки и Азии.

С конца 2013 года компания активно расширяет линейку поставок компонентов по направлению коаксиальный кабель, кварцевые генераторы и конденсаторы (керамические, пленочные, электролитические), за счёт заключения дистрибьюторских договоров

Мы предлагаем:

- Конкурентоспособные цены и скидки постоянным клиентам.
- Специальные условия для постоянных клиентов.
- Подбор аналогов.
- Поставку компонентов в любых объемах, удовлетворяющих вашим потребностям.
- Приемлемые сроки поставки, возможна ускоренная поставка.
- Доставку товара в любую точку России и стран СНГ.
- Комплексную поставку.
- Работу по проектам и поставку образцов.
- Формирование склада под заказчика.
- Сертификаты соответствия на поставляемую продукцию (по желанию клиента).
- Тестирование поставляемой продукции.
- Поставку компонентов, требующих военную и космическую приемку.
- Входной контроль качества.
- Наличие сертификата ISO.

В составе нашей компании организован Конструкторский отдел, призванный помогать разработчикам, и инженерам.

Конструкторский отдел помогает осуществить:

- Регистрацию проекта у производителя компонентов.
- Техническую поддержку проекта.
- Защиту от снятия компонента с производства.
- Оценку стоимости проекта по компонентам.
- Изготовление тестовой платы монтаж и пусконаладочные работы.
