

NB7L32M

2.5V/3.3V, 14GHz ÷2 Clock Divider w/CML Output and Internal Termination

Descriptions

The NB7L32M is an integrated ÷2 divider with differential clock inputs and asynchronous reset.

Differential clock inputs incorporate internal 50 Ω termination resistors and accept LVPECL (Positive ECL), CML, or LVDS. The high frequency reset pin is asserted on the rising edge. Upon power-up, the internal flip-flops will attain a random state; the reset allows for the synchronization of multiple NB7L32M's in a system.

The differential 16 mA CML output provides matching internal 50 Ω termination which guarantees 400 mV output swing when externally receiver terminated 50 Ω to V_{CC} (See Figure 16).

The device is housed in a small 3x3 mm 16 pin QFN package.

8. Measured by forcing $V_{INPP(MIN)}$ from a 50% duty cycle clock source. All loading with an external $R_L = 50\ \Omega$ to V_{CC} . Input edge rates 40 ps (20% – 80%).

11. Additive RMS jitter with 50% duty cycle input clock signal.

12. Device-to-device skew is measured between outputs under identical transition @ 1 GHz.
