GENERAL DESCRIPTION

The **AD5544-EP** quad, 16-bit, current output, digital-to-analog converter (DAC) is designed to operate from a 2.7 V to 5.5 V supply range.

The applied external reference input voltage (V_{REFx}) determines the full-scale output current. Integrated feedback resistors (R_{FB}) provide temperature-tracking, full-scale voltage outputs when combined with an external I-to-V precision amplifier.

A double-buffered serial data interface offers high speed, 3-wire, SPI- and microcontroller-compatible inputs using serial data in (SDI), a chip select (\overline{CS}), and clock (CLK) signals. In addition, a serial data out pin (SDO) allows for daisy chaining when multiple

packages are used. A common, level-sensitive, load DAC strobe (\overline{LDAC}) input allows the simultaneous update of all DAC outputs from previously loaded input registers. Additionally, an internal power-on reset forces the output voltage to $\overline{0}$ at system turn-on. The MSB pin allows system reset assertion (\overline{RS}) to force all registers to zero code when $\overline{MSB} = 0$ or to half-scale code when $\overline{MSB} = 1$. The **AD5544-EP** is packaged in the compact 28-lead SSOP.

Additional application and technical information can be found in the [AD5544](#) data sheet.

¹ All static performance tests (except I_{OUTX}) are performed in a closed-loop system using an external precision OP177 I-to-V converter amplifier. The AD5544 R_{FB} terminal is tied to the amplifier output. Typical values represent average readings measured at 25°C.

³ All input control signals are specified with $t_r = t_f = 2.5$ ns (10% to 90% of 3 V) and timed from a voltage level of 1.5 V.

⁴ All ac characteristic tests are performed in a closed-loop system using an AD8038 I-to-V converter amplifier.
