

# PCA8561

## Automotive 18 × 4 LCD segment driver

Rev. 4 — 27 March 2015

Product data sheet

### 1. General description

---

PCA8561 is an ultra low-power LCD segment driver with 4 backplane- and 18 segment-driver outputs, with either an I<sup>2</sup>C- or an SPI-bus interface. It comprises an internal oscillator, bias generation, instruction decoding, and display controller.

For a selection of NXP LCD segment drivers, see [Table 24 on page 45](#).

### 2. Features and benefits

---

- AEC-Q100 grade 2 (up to 105 °C) compliant for automotive applications
- Single chip LCD controller and driver
- Selectable backplane drive configuration: static, 2, 3, or 4 backplane multiplexing
- Selectable display bias configuration: static, 1/2, or 1/3
- Internal LCD bias generation with buffers
- 18 segment drives:
  - ◆ Up to 9 7-segment numeric characters
  - ◆ Up to 4 14-segment alphanumeric characters
  - ◆ Any graphics of up to 72 segments/elements
- Auto-incrementing display data and instruction loading
- Versatile blinking modes
- Independent supplies of V<sub>LCD</sub> and V<sub>DD</sub>
- Power supply ranges:
  - ◆ 1.8 V to 5.5 V for V<sub>LCD</sub>
  - ◆ 1.8 V to 5.5 V for V<sub>DD</sub>
- Ultra low-power consumption
- 400 kHz I<sup>2</sup>C-bus interface (PCA8561AHN)
- 5 MHz SPI-bus interface (PCA8561BHN)
- Internally generated or externally supplied clock signal
- Tiny package: HVQFN32, 5 mm × 5 mm

### 3. Applications

---

- Small displays integrated
  - ◆ in a car instrument cluster
  - ◆ in a control knob
- Battery operated applications
- Healthcare devices

## 4. Ordering information

Table 1. Ordering information

| Type number | Package |   |          |
|-------------|---------|---|----------|
|             | Name    | Description   | Version  |
| PCA8561AHN  | HVQFN32 | plastic thermal enhanced very thin quad flat package; no leads;32 terminals; body 5 x 5 × 0.85 mm | SOT617-3 |
| PCA8561BHN  | HVQFN32 | plastic thermal enhanced very thin quad flat package; no leads;32 terminals; body 5 x 5 × 0.85 mm | SOT617-3 |

### 4.1 Ordering options

Table 2. Ordering options

| Product type number | Orderable part number | Sales item (12NC) | Interface type       | Delivery form                    | IC revision |
|---------------------|-----------------------|-------------------|----------------------|----------------------------------|-------------|
| PCA8561AHN/A        | PCA8561AHN/AY         | 935304072518      | I <sup>2</sup> C-bus | tape and reel, 13 inch, dry pack | 1           |
| PCA8561BHN/A        | PCA8561BHN/AY         | 935305329518      | SPI-bus              | tape and reel, 13 inch, dry pack | 1           |

## 5. Marking

Table 3. Marking codes

| Type number  | Marking code |
|--------------|--------------|
| PCA8561AHN/A | 8561A        |
| PCA8561BHN/A | 8561B        |

## 7. Pinning information

### 7.1 Pinning

For mechanical details, see [Figure 30](#).

**Fig 3. Pin configuration of PCA8561AHN (HVQFN32)**

For mechanical details, see [Figure 30](#).

**Fig 4. Pin configuration of PCA8561BHN (HVQFN32)**

## 7.2 Pin description

**Table 4. Pin description**

Input or input/output pins must always be at a defined level ( $V_{SS}$  or  $V_{DD}$ ) unless otherwise specified.

| Pin      | Symbol              | Type         | Description   |
|----------|---------------------|--------------|---|
| 1        | COM3                | output       | LCD backplane output  |
| 2        | VLCD                | supply       | LCD supply voltage  |
| 3        | VDD                 | supply       | supply voltage  |
| 4        | VSS <sup>[1]</sup>  | supply       | ground supply   |
| 5        | $\overline{RST}$    | input        | reset input, active LOW   |
| 7        | CLK                 | input/output | internal oscillator output, external oscillator input <ul style="list-style-type: none"> <li>• must be left open if unused</li> </ul>   |
| 8        | SCL                 | input        | serial clock input  |
| 10       | PORE <sup>[2]</sup> | input        | Power-On Reset (POR) enable <ul style="list-style-type: none"> <li>• connect to <math>V_{DD}</math> for enabling POR</li> <li>• connect to <math>V_{SS}</math> (or leave open) for disabling POR</li> </ul> |
| 12 to 29 | SEG0 to SEG17       | output       | LCD segment outputs   |
| 30 to 32 | COM0 to COM2        | output       | LCD backplane outputs   |

### Pin layout depending on product and bus type

|    | PCA8561AHN<br>(I <sup>2</sup> C-bus) | PCA8561BHN<br>(SPI-bus) |              |   |
|----|--------------------------------------|-------------------------|--------------|---|
| 6  | A0 <sup>[2]</sup>                    | -                       | input        | hardware device address selection; <ul style="list-style-type: none"> <li>• connect to <math>V_{SS}</math> (or leave open) for logic 0</li> <li>• connect to <math>V_{DD}</math> for logic 1</li> </ul> |
|    | -                                    | SDIO                    | input/output | serial data input/output  |
| 9  | SDA                                  | -                       | output       | serial data output  |
|    | -                                    | $\overline{CE}$         | input        | chip enable input, active LOW   |
| 11 | A1 <sup>[2]</sup>                    | -                       | input        | hardware device address selection; <ul style="list-style-type: none"> <li>• connect to <math>V_{SS}</math> (or leave open) for logic 0</li> <li>• connect to <math>V_{DD}</math> for logic 1</li> </ul> |
|    | -                                    | n.c.                    | -            | not connected   |

[1] The die paddle (exposed pad) is connected to  $V_{SS}$  and should be electrically isolated.

[2] A series resistance between  $V_{DD}$  and the pin must not exceed 1 k $\Omega$  to ensure proper functionality, see [Section 16.3](#).

## 8. Functional description

### 8.1 Registers of the PCA8561

The registers of the PCA8561 are arranged in bytes with 8 bit, addressed by an address pointer. [Table 5](#) depicts the layout.

**Table 5. Registers of the PCA8561**

Bits labeled as 0 must always be written with logic 0; bits labeled as - are ignored by the device.

| Register name                               | Address | Bits    |       |       |         |          |         |       |       | Reference                |
|---|---------|---------|-------|-------|---------|----------|---------|-------|-------|--------------------------|
|   |         | AP[4:0] | 7     | 6     | 5       | 4        | 3       | 2     | 1     |                          |
| <b>Command registers</b>                    |         |         |       |       |         |          |         |       |       |                          |
| Software_reset                              | 00h     | SR[7:0] |       |       |         |          |         |       |       | <a href="#">Table 9</a>  |

|   | 09h     | -       | -     | -     | -       | -        | -       | SEG17 | SEG16 |                          |
| COM2  | 0Ah     | SEG7    | SEG6  | SEG5  | SEG4    | SEG3     | SEG2    | SEG1  | SEG0  |                          |
|   | 0Bh     | SEG15   | SEG14 | SEG13 | SEG12   | SEG11    | SEG10   | SEG9  | SEG8  |                          |
|   | 0Ch     | -       | -     | -     | -       | -        | -       | SEG17 | SEG16 |                          |
| COM3  | 0Dh     | SEG7    | SEG6  | SEG5  | SEG4    | SEG3     | SEG2    | SEG1  | SEG0  |                          |
|   | 0Eh     | SEG15   | SEG14 | SEG13 | SEG12   | SEG11    | SEG10   | SEG9  | SEG8  |                          |
|   | 0Fh     | -       | -     | -     | -       | -        | -       | SEG17 | SEG16 |                          |

[1] See [Table 10](#).

For writing to the registers, send the address byte first, then write the data to the register (see [Section 11.1.4](#) and [Section 11.2.1](#)). The address byte works as an address pointer. For the succeeding registers, the address pointer is automatically incremented by 1 (see [Figure 5](#)) and all following data are written into these register addresses. After address 10h, the auto-incrementing will stop and data are ignored.

Fig 5. Address counter incrementing

## 8.2 Command registers of the PCA8561

### 8.2.1 Command: Device\_ctrl

The Device\_ctrl command sets the device into a defined state. It should be executed before enabling the display (see bit DE in [Table 7](#)).

Table 6. Device\_ctrl - device control command register (address 01h) bit description

| Bit    | Symbol                   | Value                              | Description  |
|--------|--------------------------|------------------------------------|--|
| 7 to 5 | -                        | 000                                | default value  |
| 4 to 2 | FF[2:0]                  | <b>frame frequency selection</b>   |  |
|        |                          | 000                                | f <sub>fr</sub> = 32 Hz                                      |
|        |                          | 001 <sup>[1]</sup>                 | f <sub>fr</sub> = 64 Hz                                      |
|        |                          | 010                                | f <sub>fr</sub> = 96 Hz                                      |
|        |                          | 011                                | f <sub>fr</sub> = 128 Hz                                     |
|        |                          | 100                                | f <sub>fr</sub> = 160 Hz                                     |
|        |                          | 101                                | f <sub>fr</sub> = 192 Hz                                     |
|        |                          | 110                                | f <sub>fr</sub> = 224 Hz                                     |
| 111    | f <sub>fr</sub> = 256 Hz |                                    |  |
| 1      | OSC                      | <b>internal oscillator control</b> |  |
|        |                          | 0 <sup>[1]</sup>                   | enabled  |
|        |                          | 1                                  | disabled   |
| 0      | COE                      | <b>clock output enable</b>         |  |
|        |                          | 0 <sup>[1]</sup>                   | clock signal not available on pin CLK; pin CLK is in 3-state |
|        |                          | 1                                  | clock signal available on pin CLK                            |

[1] Default value.

#### 8.2.1.1 Internal oscillator and clock output

Bit OSC enables or disables the internal oscillator. When the internal oscillator is used, bit COE allows making the clock signal available on pin CLK. If this is not intended, pin CLK should be left open. The design ensures that the duty cycle of the clock output is 50 : 50 (% HIGH-level time : % LOW-level time).

In applications where an external clock has to be applied to the PCA8561, bit OSC must be set logic 1 and COE logic 0. In this case pin CLK becomes an input.

In power-down mode (see [Section 8.3.1](#))

- if pin CLK is configured as an output, there is no signal on CLK
- if pin CLK is configured as an input, the signal on CLK can be removed.

**Remark:** A clock signal must always be supplied to the device if the display is enabled (see bit DE in [Table 7 on page 8](#)). Removing the clock may freeze the LCD in a DC state, which is not suitable for the liquid crystal.

### 8.2.2 Command: Display\_ctrl\_1

The Display\_ctrl\_1 command allows configuring the basic display set-up.

**Table 7. Display\_ctrl\_1 - display control command 1 register (address 02h) bit description**

| Bit    | Symbol           | Value                                 | Description  |
|--------|------------------|---------------------------------------|--|
| 7 to 5 | -                | 000                                   | default value  |
| 4      | BOOST            | <b>large display mode support</b>     |  |
|        |                  | 0 <sup>[1]</sup>                      | standard power drive scheme                                    |
|        |                  | 1                                     | enhanced power drive scheme for higher display loads           |
| 3 to 2 | MUX[1:0]         | <b>multiplex drive mode selection</b> |  |
|        |                  | 00 <sup>[1]</sup>                     | 1:4 multiplex drive mode; COM0 to COM3 (n <sub>MUX</sub> = 4)  |
|        |                  | 01                                    | 1:3 multiplex drive mode; COM0 to COM2 (n <sub>MUX</sub> = 3)  |
|        |                  | 10                                    | 1:2 multiplex drive mode; COM0 and COM1 (n <sub>MUX</sub> = 2) |
|        |                  | 11                                    | static drive mode; COM0 (n <sub>MUX</sub> = 1)                 |
| 1      | B <sup>[2]</sup> | <b>bias mode selection</b>            |  |
|        |                  | 0 <sup>[1]</sup>                      | 1/3 bias (a <sub>bias</sub> = 2)                               |
|        |                  | 1                                     | 1/2 bias (a <sub>bias</sub> = 1)                               |
| 0      | DE               | <b>display enable<sup>[3]</sup></b>   |  |
|        |                  | 0 <sup>[1]</sup>                      | display disabled; device is in power-down mode                 |
|        |                  | 1                                     | display enabled; device is in power-on mode                    |

[1] Default value.

[2] Not applicable for static drive mode.

[3] See [Section 8.3.1](#).

#### 8.2.2.1 Enhanced power drive mode

By setting the BOOST bit to logic 1, the driving capability of the display signals is increased to cope with large displays with a higher effective capacitance. Setting this bit increases the current consumption on V<sub>LCD</sub>.

#### 8.2.2.2 Multiplex drive mode

MUX[1:0] sets the multiplex driving scheme and the associated backplane drive signals, which are active. For further details, see [Section 9.2 on page 15](#).

### 8.2.3 Command: Display\_ctrl\_2

Table 8. Display\_ctrl\_2 - display control command 2 register (address 03h) bit description

| Bit    | Symbol  | Value                           | Description                        |
|--------|---------|---------------------------------|------------------------------------|
| 7 to 3 | -       | 00000                           | default value                      |
| 2 to 1 | BL[1:0] | <b>blink control</b>            |                                    |
|        |         | 00 <sup>[1]</sup>               | blinking off                       |
|        |         | 01                              | blinking on, $f_{blink} = 0.5$ Hz  |
|        |         | 10                              | blinking on, $f_{blink} = 1$ Hz    |
|        |         | 11                              | blinking on, $f_{blink} = 2$ Hz    |
| 0      | INV     | <b>inversion mode selection</b> |                                    |
|        |         | 0 <sup>[1]</sup>                | line inversion (driving scheme A)  |
|        |         | 1                               | frame inversion (driving scheme B) |

[1] Default value.

#### 8.2.3.1 Blinking

The whole display blinks at frequencies selected by the blink control bits BL[1:0], see [Table 8](#). The blink frequencies are derived from the clock frequency. During the blank-out phase of the blinking period, the display is turned off.

If an external clock with frequency  $f_{clk(ext)}$  is used, the blinking frequency is determined by [Equation 1](#). For notation, see [Section 9.2](#).

$$f_{blink(eff)} = \frac{2 \times n_{MUX} \times f_{fr} \times f_{blink}}{f_{clk(ext)}} \tag{1}$$

#### 8.2.3.2 Line inversion (driving scheme A) and frame inversion (driving scheme B)

The waveforms used to drive LCD inherently produce a DC voltage across the display cell. The PCA8561 compensates for the DC voltage by inverting the waveforms on alternate frames or alternate lines. The choice of compensation method is determined with the INV bit.

### 8.3 Starting and resetting the PCA8561

If the internal Power-On Reset (POR) is enabled by connecting pin PORE to  $V_{DD}$ , the chip resets automatically when  $V_{DD}$  rises above the minimum supply voltage. No further action is required.

If the internal POR is disabled by connecting pin PORE to  $V_{SS}$ , the chip must be reset by driving the  $\overline{RST}$  pin to logic 0 for at least 10  $\mu\text{s}$ , see [Figure 6](#).

Fig 6. Reset pulse timing

Alternatively a software reset can be applied (see [Section 8.3.4](#)).

Following a reset, the register 00h has to be rewritten with 0h by the next command byte or the address pointer AP[4:0] has to be set to the required address after a new START procedure.

#### 8.3.1 Power-down mode

After a reset, the PCA8561 remains in power-down mode. In power-down mode the oscillator is switched off and there is no output on pin CLK. The register settings remain unchanged and the bus remains active. To enable the PCA8561, bit DE (command Display\_ctrl\_1, see [Table 7 on page 8](#)) must be set to logic 1.

#### 8.3.2 Power-On Reset (POR)

If pin PORE is connected to  $V_{DD}$ , the PCA8561 comprises an internal POR, which puts the device into the following starting conditions:

- All backplane and segment outputs are set to  $V_{SS}$
- The selected drive mode is: 1:4 multiplex with  $\frac{1}{3}$  bias
- Blinking is switched off
- The address pointer is cleared (set to logic 0)
- The display and the internal oscillator are disabled
- The display registers are set to logic 0
- The bus interface is initialized

**Remark:** The internal POR can be disabled by connecting pin PORE to  $V_{SS}$ . In this case, the internal registers are not defined and require a hardware reset according to [Section 8.3.3](#) or a software reset, see [Section 8.3.4](#).

### 8.3.3 Hardware reset: $\overline{RST}$ pin

At power-on the PCA8561 can be reset to the following starting conditions by pulling pin  $\overline{RST}$  low:

- All backplane and segment outputs are set to  $V_{SS}$
- The selected drive mode is: 1:4 multiplex with  $\frac{1}{3}$  bias
- Blinking is switched off
- The bus interface is initialized
- The address pointer is cleared (set to logic 0)
- The display and the internal oscillator are disabled
- The display registers are set to logic 0

**Remark:** The hardware reset overrides the POR see [Section 8.3.2](#).

### 8.3.4 Command: Software\_reset

The internal registers including the display registers and the address pointer (set to logic 0) of the device are reset by the Software\_reset command.

**Table 9. Software\_reset - software reset command register (address 00h) bit description**  
*This register can only be written but not read.*

| Bit    | Symbol  | Value                   | Description    |
|--------|---------|-------------------------|----------------|
| 7 to 0 | SR[7:0] | <b>software reset</b>   |                |
|        |         | 00000000 <sup>[1]</sup> | no reset       |
|        |         | 00101100                | software reset |

[1] Default value.

## 8.4 Display data register mapping

The example in [Table 10](#) and [Figure 7](#) illustrates the segment and backplane mapping of the display in relation to the display RAM.

For example, in 1:4 multiplex drive mode, the backplanes are served by signals COM0 to COM3 and the segments are driven by signals SEG0 to SEG17. Contents of addresses 04h to 06h are allocated to the first row (COM0) starting with the LSB driving the leftmost element and moving forward to the right with increasing bit position. If a bit is logic 0, the element is off, if it is logic 1 the element is turned on. All register content is LSB to MSB left to right. Addresses 07h to 09h serve COM1 signals, addresses 0Ah to 0Ch serve COM2 signals, and addresses 0Dh to 0Fh serve COM3 signals.

For displays with fewer segments/elements the unused bits are ignored.

Table 10. Register to segment and backplane mapping

| Backplanes <sup>[1]</sup>       | Segments       |     |                |     |                               |     |
|---------------------------------|----------------|-----|----------------|-----|-------------------------------|-----|
|                                 | SEG0 to SEG7   |     | SEG8 to SEG15  |     | SEG16 to SEG17                |     |
|                                 | LSB            | MSB | LSB            | MSB | LSB                           | MSB |
| <b>1:4 multiplex drive mode</b> |                |     |                |     |                               |     |
| COM0                            | content of 04h |     | content of 05h |     | content of 06h <sup>[2]</sup> |     |
| COM1                            | content of 07h |     | content of 08h |     | content of 09h <sup>[2]</sup> |     |
| COM2                            | content of 0Ah |     | content of 0Bh |     | content of 0Ch <sup>[2]</sup> |     |
| COM3                            | content of 0Dh |     | content of 0Eh |     | content of 0Fh <sup>[2]</sup> |     |
| <b>1:3 multiplex drive mode</b> |                |     |                |     |                               |     |
| COM0                            | content of 04h |     | content of 05h |     | content of 06h <sup>[2]</sup> |     |
| COM1                            | content of 07h |     | content of 08h |     | content of 09h <sup>[2]</sup> |     |
| COM2                            | content of 0Ah |     | content of 0Bh |     | content of 0Ch <sup>[2]</sup> |     |
| <b>1:2 multiplex drive mode</b> |                |     |                |     |                               |     |
| COM0                            | content of 04h |     | content of 05h |     | content of 06h <sup>[2]</sup> |     |
| COM1                            | content of 07h |     | content of 08h |     | content of 09h <sup>[2]</sup> |     |
| <b>static drive mode</b>        |                |     |                |     |                               |     |
| COM0                            | content of 04h |     | content of 05h |     | content of 06h <sup>[2]</sup> |     |

[1] See also [Section 9.3.1 on page 23](#).

[2] Bits [7:2] are ignored.

Fig 7. Display RAM organization bitmap for MUX 1:4

aaa-014863

## 9. Possible display configurations

The possible display configurations of the PCA8561 depend on the number of active backplane outputs required. A selection of display configurations is shown in [Table 11](#). All of these configurations can be implemented in the typical systems shown in [Figure 9](#) or [Figure 10](#).

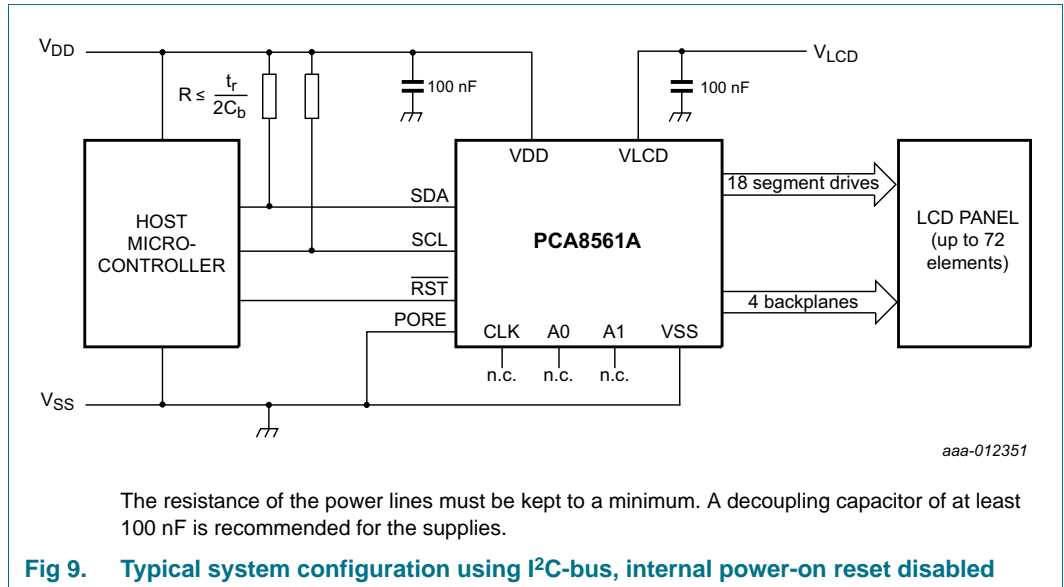

Fig 8. Example of displays suitable for PCA8561

Table 11. Selection of possible display configurations

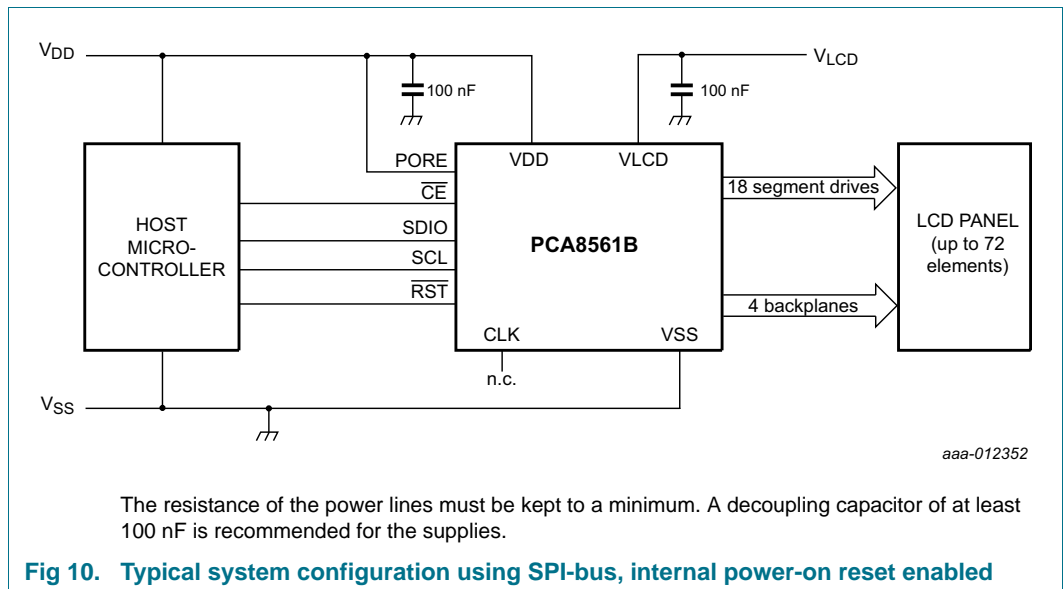

| Number of Backplanes | Icons | Digits/Characters        |                           | Dot matrix: segments/elements |
|----------------------|-------|--------------------------|---------------------------|-------------------------------|
|                      |       | 7-segment <sup>[1]</sup> | 14-segment <sup>[2]</sup> |                               |
| 4                    | 72    | 9                        | 4                         | 72 dots (4 × 18)              |
| 3                    | 54    | 6                        | 3                         | 54 dots (3 × 18)              |
| 2                    | 36    | 4                        | 2                         | 36 dots (2 × 18)              |
| 1                    | 18    | 2                        | 1                         | 18 dots (1 × 18)              |

[1] 7 segment display has 8 segments/elements including the decimal point.

[2] 14 segment display has 16 segments/elements including decimal point and accent dot.

The host microcontroller manages the 2-line I<sup>2</sup>C-bus communication channel with the PCA8561. The internal oscillator is used and the internal POR is disabled in the example (Figure 9). The appropriate biasing voltages for the multiplexed LCD waveforms are generated internally. The only other connections required to complete the system are the reset, the power supplies (V<sub>DD</sub>, V<sub>SS</sub>, and V<sub>LCD</sub>) and the LCD panel chosen for the application.

The host microcontroller manages the 3-line SPI-bus communication channel with the PCA8561. The internal oscillator is enabled and the internal POR is enabled in the example (Figure 10). The appropriate biasing voltages for the multiplexed LCD waveforms are generated internally. The only other connections required to complete the system are reset, the power supplies (V<sub>DD</sub>, V<sub>SS</sub>, and V<sub>LCD</sub>) and the LCD panel chosen for the application.

### 9.1 LCD bias generator

Fractional LCD biasing voltages are obtained from an internal voltage divider of three impedances connected between  $V_{LCD}$  and  $V_{SS}$ . These intermediate levels are tapped off at positions of  $\frac{1}{3}$  and  $\frac{2}{3}$ , or  $\frac{1}{2}$ , depending on the bias mode chosen. To keep current consumption to a minimum, on-chip low-power buffers provide these levels to the display.

### 9.2 LCD voltage selector

The LCD voltage selector coordinates the multiplexing of the LCD in accordance with the selected LCD drive configuration. The operation of the voltage selector is controlled by the Display\_ctrl\_1 command (see [Table 7](#)). The biasing configurations that apply to the preferred modes of operation, together with the biasing characteristics as functions of  $V_{LCD}$  and the resulting discrimination ratios (D) are given in [Table 12](#).

**Table 12. Biasing characteristics**

| LCD drive mode | Number of: |        | LCD bias configuration | $\frac{V_{off(RMS)}}{V_{LCD}}$ | $\frac{V_{on(RMS)}}{V_{LCD}}$ | $D = \frac{V_{on(RMS)}}{V_{off(RMS)}}$ |
|----------------|------------|--------|------------------------|--------------------------------|-------------------------------|--|
|                | Backplanes | Levels |                        |                                |                               |  |
| static         | 1          | 2      | static                 | 0                              | 1                             | $\infty$                               |
| 1:2 multiplex  | 2          | 3      | $\frac{1}{2}$          | 0.354                          | 0.791                         | 2.236                                  |
| 1:2 multiplex  | 2          | 4      | $\frac{1}{3}$          | 0.333                          | 0.745                         | 2.236                                  |
| 1:3 multiplex  | 3          | 4      | $\frac{1}{3}$          | 0.333                          | 0.638                         | 1.915                                  |
| 1:4 multiplex  | 4          | 4      | $\frac{1}{3}$          | 0.333                          | 0.577                         | 1.732                                  |

A practical value for  $V_{LCD}$  is determined by equating  $V_{off(RMS)}$  with a defined LCD threshold voltage ( $V_{th(off)}$ ), typically when the LCD exhibits approximately 10 % contrast. In the static drive mode, a suitable choice is  $V_{LCD} > 3V_{th(off)}$ .

Multiplex drive modes of 1:3 and 1:4 with  $\frac{1}{2}$  bias are possible but the discrimination and hence the contrast ratios are smaller.

Bias is calculated with [Equation 2](#)

$$\frac{1}{1 + a_{bias}} \tag{2}$$

The values for  $a_{bias}$  are:

$$a_{bias} = 1 \text{ for } \frac{1}{2} \text{ bias}$$

$$a_{bias} = 2 \text{ for } \frac{1}{3} \text{ bias}$$

The RMS on-state voltage ( $V_{on(RMS)}$ ) for the LCD is calculated with [Equation 3](#):

$$V_{on(RMS)} = V_{LCD} \sqrt{\frac{a_{bias}^2 + 2a_{bias} + n_{MUX}}{n_{MUX} \times (1 + a_{bias})^2}} \tag{3}$$

where the values for  $n_{MUX}$  are

- $n_{MUX} = 1$  for static drive mode
- $n_{MUX} = 2$  for 1:2 multiplex drive mode
- $n_{MUX} = 3$  for 1:3 multiplex drive mode
- $n_{MUX} = 4$  for 1:4 multiplex drive mode

The RMS off-state voltage ( $V_{off(RMS)}$ ) for the LCD is calculated with [Equation 4](#):

$$V_{off(RMS)} = V_{LCD} \sqrt{\frac{a_{bias}^2 - 2a_{bias} + n_{MUX}}{n_{MUX} \times (1 + a_{bias})^2}} \quad (4)$$

Discrimination is a term which is defined as the ratio of the on and off RMS voltages ( $V_{on(RMS)}$  to  $V_{off(RMS)}$ ) across a segment. It can be thought of as a measurement of contrast. Discrimination is determined from [Equation 5](#):

$$D = \frac{V_{on(RMS)}}{V_{off(RMS)}} = \sqrt{\frac{a_{bias}^2 + 2a_{bias} + n_{MUX}}{a_{bias}^2 - 2a_{bias} + n_{MUX}}} \quad (5)$$

Using [Equation 5](#), the discrimination for an LCD drive mode of 1:3 multiplex with  $\frac{1}{2}$  bias is  $\sqrt{3} = 1.732$  and the discrimination for an LCD drive mode of 1:4 multiplex with  $\frac{1}{2}$  bias is  $\frac{\sqrt{21}}{3} = 1.528$ .

The advantage of these LCD drive modes is a reduction of the LCD full scale voltage  $V_{LCD}$  as follows:

- 1:3 multiplex ( $\frac{1}{2}$  bias):  $V_{LCD} = \sqrt{6} \times V_{off(RMS)} = 2.449V_{off(RMS)}$
- 1:4 multiplex ( $\frac{1}{2}$  bias):  $V_{LCD} = \left[ \frac{4 \times \sqrt{3}}{3} \right] = 2.309V_{off(RMS)}$

These compare with  $V_{LCD} = 3V_{off(RMS)}$  when  $\frac{1}{3}$  bias is used.

$V_{LCD}$  is sometimes referred as the LCD operating voltage.

### 9.2.1 Electro-optical performance

Suitable values for  $V_{on(RMS)}$  and  $V_{off(RMS)}$  are dependent on the LCD liquid used. The RMS voltage, at which a pixel is switched on or off, determine the transmissibility of the pixel.

For any given liquid, there are two threshold values defined. One point is at 10 % relative transmission (at  $V_{th(off)}$ ) and the other at 90 % relative transmission (at  $V_{th(on)}$ ), see [Figure 11](#). For a good contrast performance, the following rules should be followed:

$$V_{on(RMS)} \geq V_{th(on)} \quad (6)$$

$$V_{off(RMS)} \leq V_{th(off)} \quad (7)$$

$V_{on(RMS)}$  (see [Equation 3](#)) and  $V_{off(RMS)}$  (see [Equation 5](#)) are properties of the display driver and are affected by the selection of  $a_{bias}$ ,  $n_{MUX}$ , and the  $V_{LCD}$  voltage.

$V_{th(off)}$  and  $V_{th(on)}$  are properties of the LCD liquid and can be provided by the module manufacturer.  $V_{th(off)}$  is sometimes named  $V_{th}$ .  $V_{th(on)}$  is sometimes named saturation voltage  $V_{sat}$ .

It is important to match the module properties to those of the driver in order to achieve optimum performance.

Fig 11. Electro-optical characteristic: relative transmission curve of the liquid

9.2.2 LCD drive mode waveforms

9.2.2.1 Static drive mode

The static LCD drive mode is used when a single backplane is provided in the LCD. The backplane (COMn) and segment (SEGN) drive waveforms for this mode are shown in [Figure 12](#).

Fig 12. Static drive mode waveforms

9.2.2.2 1:2 Multiplex drive mode

When two backplanes are provided in the LCD, the 1:2 multiplex mode applies. The PCA8561 allows the use of 1/2 bias or 1/3 bias in this mode as shown in Figure 13 and Figure 14.

Fig 13. Waveforms for the 1:2 multiplex drive mode with 1/2 bias

9.2.2.3 1:3 Multiplex drive mode

When three backplanes are provided in the LCD, the 1:3 multiplex drive mode applies, as shown in Figure 15.

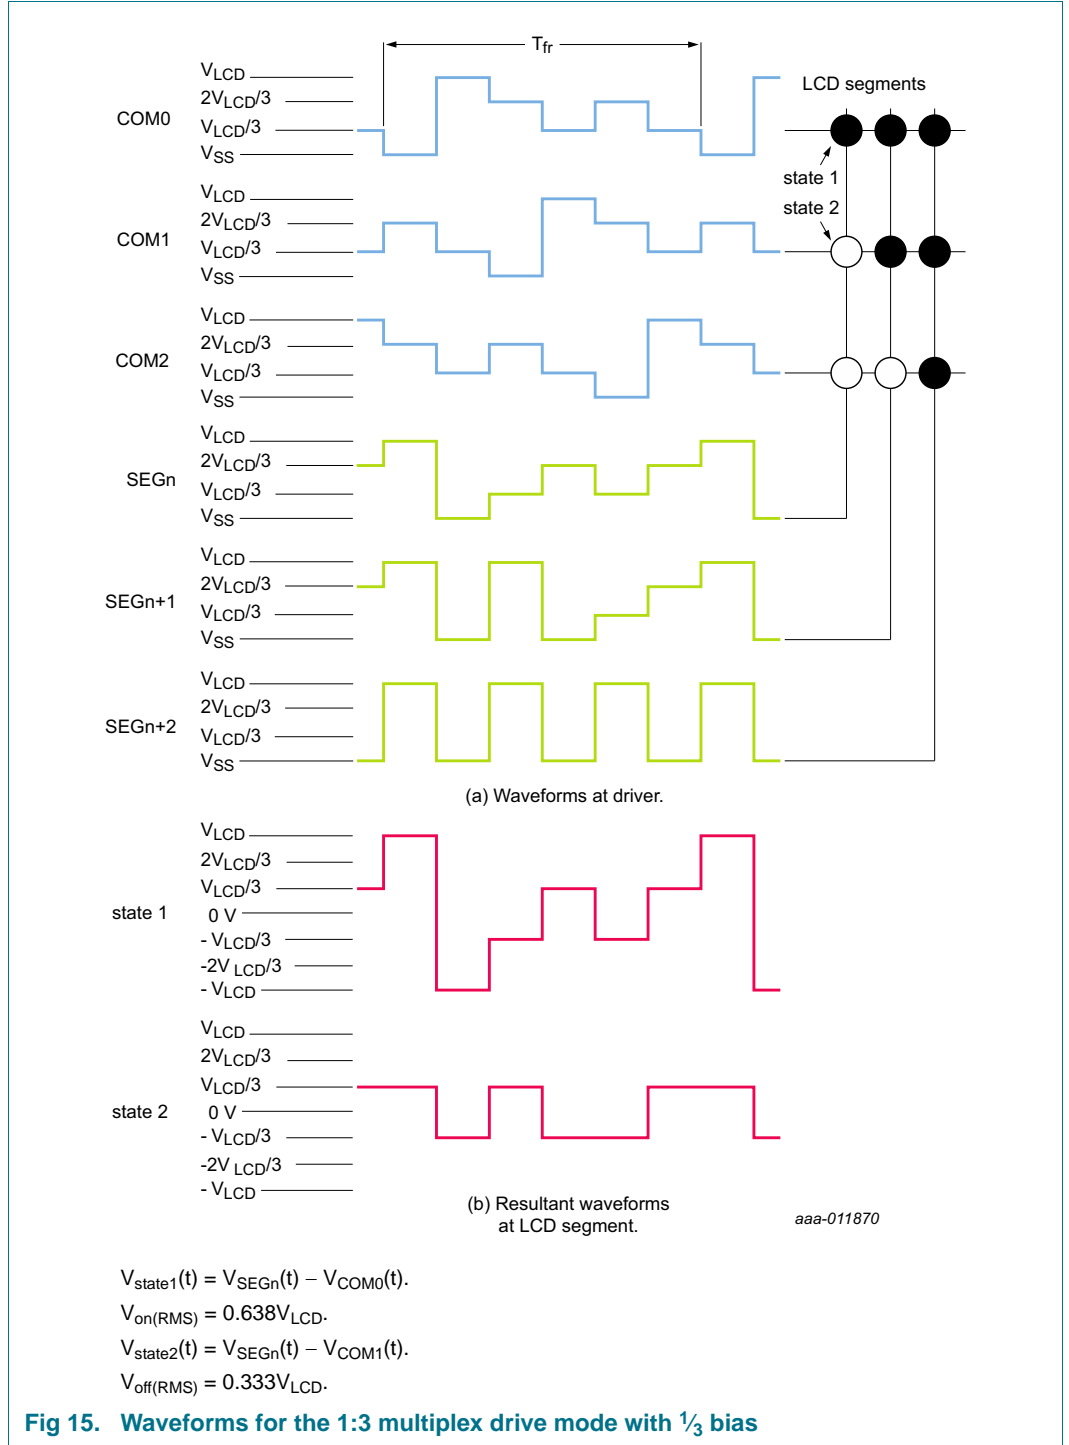

Fig 15. Waveforms for the 1:3 multiplex drive mode with 1/3 bias

9.2.2.4 1:4 Multiplex drive mode

When four backplanes are provided in the LCD, the 1:4 multiplex drive mode applies as shown in Figure 16.

## 9.3 Backplane and segment outputs

### 9.3.1 Backplane outputs

The LCD drive section includes four backplane outputs COM0 to COM3, which must be directly connected to the LCD. The backplane output signals are generated in accordance with the selected LCD drive mode. If less than four backplane outputs are required, the unused outputs can be left open-circuit.

- In 1:3 multiplex drive mode, COM3 carries the same signal as COM1, therefore these two outputs can be tied together to give enhanced drive capabilities
- In 1:2 multiplex drive mode, COM0 and COM2, respectively, COM1 and COM3 all carry the same signals and may also be paired to increase the drive capabilities
- In static drive mode, the same signal is carried by all four backplane outputs and they can be connected in parallel for very high drive requirements

### 9.3.2 Segment outputs

The LCD drive section includes 18 segment outputs SEG0 to SEG17, which must be directly connected to the LCD. The segment output signals are generated in accordance with the multiplexed backplane signals and with data residing in the display registers. When less than 18 segment outputs are required, the unused segment outputs must be left open-circuit.

## 10. Power Sequencing

### 10.1 Power-on

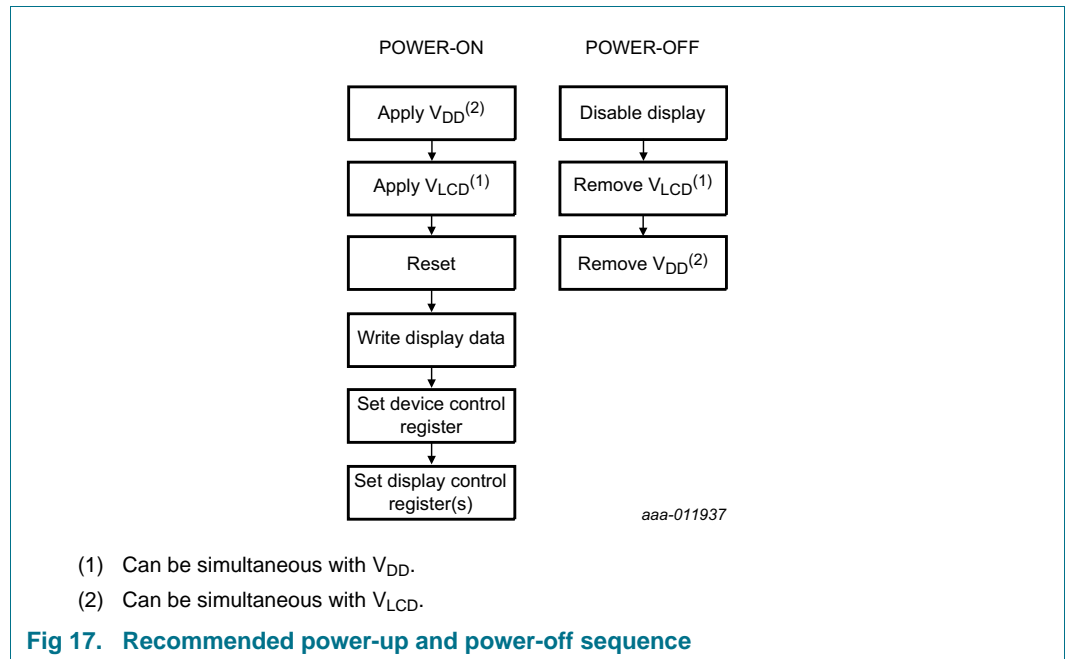

To avoid unwanted artifacts on the display,  $V_{LCD}$  must never be asserted before  $V_{DD}$ , it is permitted to assert  $V_{DD}$  and  $V_{LCD}$  at the same time.

### 10.2 Power-off

Before turning the power to the device off, the display must be disabled by setting bit DE to logic 0. To avoid unwanted artifacts on the display,  $V_{LCD}$  must never be connected, while  $V_{DD}$  is switched off. It is permitted to switch off  $V_{DD}$  and  $V_{LCD}$  simultaneously.

### 10.3 Power sequences

[Figure 17](#) depicts the recommended power-up and power-off sequence.

## 11. Bus interfaces

### 11.1 I<sup>2</sup>C-bus interface of the PCA8561A

The I<sup>2</sup>C-bus is for bidirectional, two-line communication between different ICs. The two lines are a Serial Data line (SDA) and a Serial Clock line (SCL). Both lines must be connected to a positive supply via a pull-up resistor. Data transfer may be initiated only when the bus is not busy. Both data and clock lines remain HIGH when the bus is not busy. The PCA8561 acts as a slave receiver when being written to and as a slave transmitter when being read from.

Fig 18. I<sup>2</sup>C read and write protocol

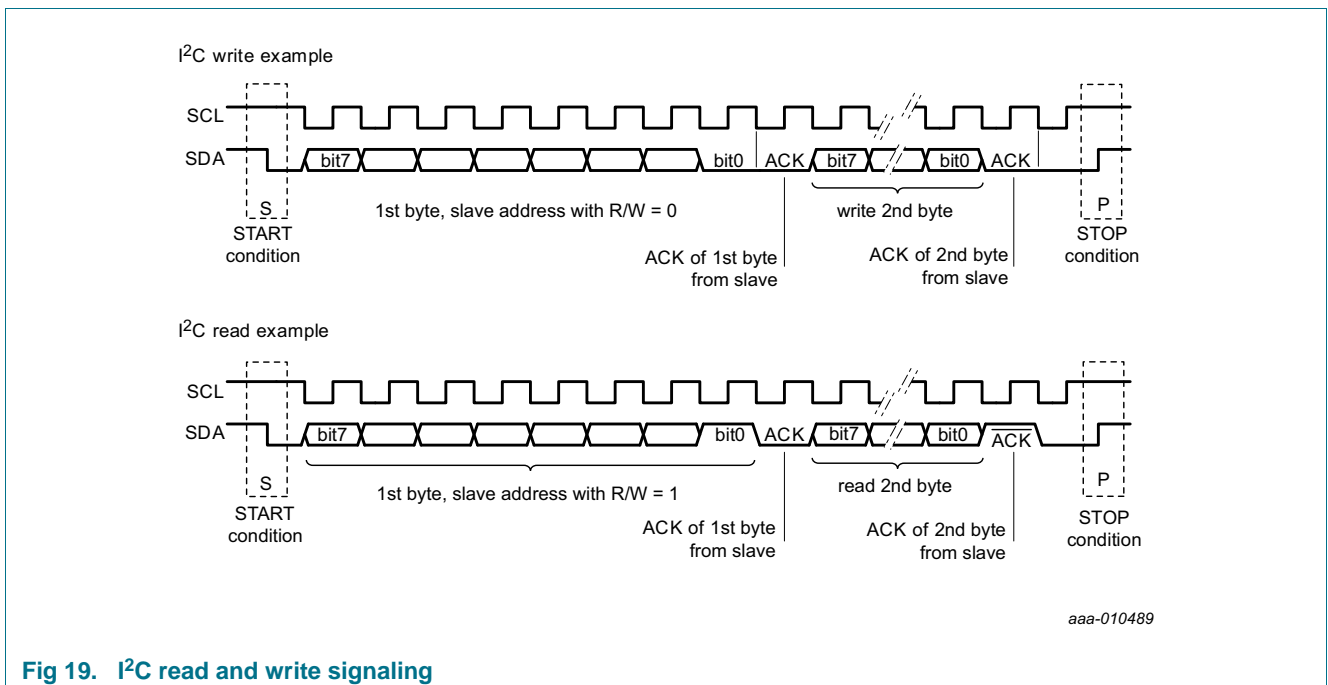

Fig 19. I<sup>2</sup>C read and write signaling

#### 11.1.1 Bit transfer

One data bit is transferred during each clock pulse. The data on the SDA line must remain stable during the HIGH period of the clock pulse, as changes in the data line at this time are interpreted as STOP or START conditions.

### 11.1.2 START and STOP conditions

A HIGH-to-LOW transition of the data line while the clock is HIGH is defined as the START condition - S.

A LOW-to-HIGH transition of the data line while the clock is HIGH is defined as the STOP condition - P (see [Figure 19](#)).

### 11.1.3 Acknowledge

Each byte of 8 bits is followed by an acknowledge cycle. An acknowledge is defined as logic 0. A not-acknowledge is defined as logic 1.

When written to, the slave will generate an acknowledge after the reception of each byte. After the acknowledge, another byte may be transmitted. It is also possible to send a STOP or START condition.

When read from, the master receiver must generate an acknowledge after the reception of each byte. When the master receiver no longer requires bytes to be transmitted, it must generate a not-acknowledge. After the not-acknowledge, either a STOP or START condition must be sent.

**Remark:** The PCA8561 omits the not-acknowledge. After the last byte read, the end of transmission is indicated by a STOP or START condition from the master.

A detailed description of the I<sup>2</sup>C-bus specification is given in [Ref. 12 "UM10204"](#).

### 11.1.4 I<sup>2</sup>C interface protocol

The PCA8561 uses the I<sup>2</sup>C interface for data transfer. Interpretation of the data is determined by the interface protocol.

#### 11.1.4.1 Write protocol

After the I<sup>2</sup>C slave address is transmitted, the PCA8561 requires that the register address pointer is defined. It can take the value 00h to 0Fh. Values outside of that range will result in the transfer being ignored, however the slave will still respond with acknowledge pulses.

After the register address has been transmitted, write data is transmitted. The minimum number of data write bytes is 0 and the maximum number is unlimited. After each write, the address pointer increments by one. After address 0Fh, the address pointer stops incrementing at address 10h.

- I<sup>2</sup>C START condition
- I<sup>2</sup>C slave address + write
- start register pointer
- write data
- write data
- :
- write data
- I<sup>2</sup>C STOP condition; an I<sup>2</sup>C RE-START condition is also possible.

11.1.4.2 Read protocol

When reading the PCA8561, reading starts at the current position of the address pointer. The address pointer for read data should first be defined by a write sequence.

- I<sup>2</sup>C START condition
- I<sup>2</sup>C slave address + write
- start address pointer
- I<sup>2</sup>C STOP condition; an I<sup>2</sup>C RE-START condition is also possible.

After setting the address pointer, a read can be executed. After the I<sup>2</sup>C slave address is transmitted, the PCA8561 will immediately output read data. After each read, the address pointer increments by one. After address 0Fh, the address pointer stops incrementing at 10h.

- I<sup>2</sup>C START condition
- I<sup>2</sup>C slave address + read
- read data (master sends acknowledge bit)
- read data (master sends acknowledge bit)
- :

11.1.4.3 I<sup>2</sup>C-bus slave address

Device selection depends on the I<sup>2</sup>C-bus slave address. Four different I<sup>2</sup>C-bus slave addresses can be used to address the PCA8561 (see [Table 13](#)).

Table 13. I<sup>2</sup>C slave address byte

| Bit | Slave address |   |   |   |   |    |    | 0<br>LSB          |
|-----|---------------|---|---|---|---|----|----|-------------------|
|     | 7<br>MSB      | 6 | 5 | 4 | 3 | 2  | 1  |                   |
|     | 0             | 1 | 1 | 1 | 0 | A1 | A0 | R/ $\overline{W}$ |

The least significant bit of the slave address byte is bit R/ $\overline{W}$  (see [Table 14](#)).

Table 14. R/ $\overline{W}$ -bit description

| R/ $\overline{W}$ | Description |
|-------------------|-------------|
| 0                 | write data  |
| 1                 | read data   |

Bit 1 and bit 2 of the slave address are defined by connecting the input pins A0 and A1 to either V<sub>SS</sub> (logic 0) or V<sub>DD</sub> (logic 1). Therefore, four instances of PCA8561 can be distinguished on the same I<sup>2</sup>C-bus.

## 11.2 SPI-bus interface of the PCA8561B

Data transfer to the device is made via a 3-line SPI-bus (see [Table 15](#)). There is no dedicated output data line. The SPI-bus is initialized whenever the chip enable line pin  $\overline{CE}$  is pulled down.

Table 15. Serial interface

| Symbol          | Function                                      | Description   |
|-----------------|---|---|
| $\overline{CE}$ | chip enable input <sup>[1]</sup> ; active LOW | when HIGH, the interface is reset   |
| SCL             | serial clock input                            | input may be higher than $V_{DD}$   |
| SDIO            | serial data input/output                      | input data are sampled on the rising edge of SCL, output data are valid after the falling edge of SCL |

[1] The chip enable must not be wired permanently LOW.

### 11.2.1 Data transmission

The chip enable signal is used to identify the transmitted data. Each data transfer is a byte with the Most Significant Bit (MSB) sent first.

The transmission is controlled by the active LOW chip enable signal  $\overline{CE}$ . The first byte transmitted is the register address comprising of the address pointer and the R/W bit.

Fig 20. Data transfer overview

Table 16. Address byte definition

| Bit    | Symbol  | Value                                    | Description                              |
|--------|---------|--|--|
| 7      | R/W     | <b>data read or write selection</b>      |  |
|        |         | 0  | write data                               |
|        |         | 1  | read data                                |
| 6 to 5 | -       | 00                                       | default value                            |
| 4 to 0 | AP[4:0] | <b>pointer to register start address</b> |  |
|        |         | 00h to 0Fh                               | valid range; other addresses are ignored |

After the register address byte, the register contents follows with the address pointer being auto-incremented after every eighth bit sent (see [Section 8.1 on page 6](#)).

#### 11.2.1.1 Write protocol

After the  $\overline{CE}$  is set LOW, the PCA8561 requires that R/W and the register address pointer is defined. It can take the value 00h to 0Fh. Values outside of that range will result in the transfer being ignored.

After the register address has been transmitted, write data is transmitted. The minimum number of data write bytes is 0 and the maximum number is unlimited. After each write, the address pointer increments by one. After address 0Fh, the address pointer stops incrementing at 10h.

- $\overline{CE}$  set LOW
- $R/\overline{W} = 0$  and register address
- write data
- write data
- :
- write data
- $\overline{CE}$  set HIGH

**Fig 21. SPI-bus write example: writing two data bytes to registers 00h and 01h**

**11.2.1.2 Read protocol**

When reading the PCA8561, reading starts at the defined position of the address pointer. After setting the address pointer, the read can be executed. After each read, the address pointer increments by one. After address 0Fh, the address pointer stops incrementing at 10h.

- $\overline{CE}$  set LOW
- $R/\overline{W} = 1$  and register address
- read data
- read data
- :
- $\overline{CE}$  set HIGH

**Fig 22. SPI-bus read example: reading two data bytes from registers 04h and 05h**

11.3 EMC detection

The PCA8561 is ruggedized against EMC susceptibility; however it is not possible to cover all cases. To detect if a severe EMC event has occurred, it is possible to check the responsiveness of the device by reading its registers.

12. Internal circuitry

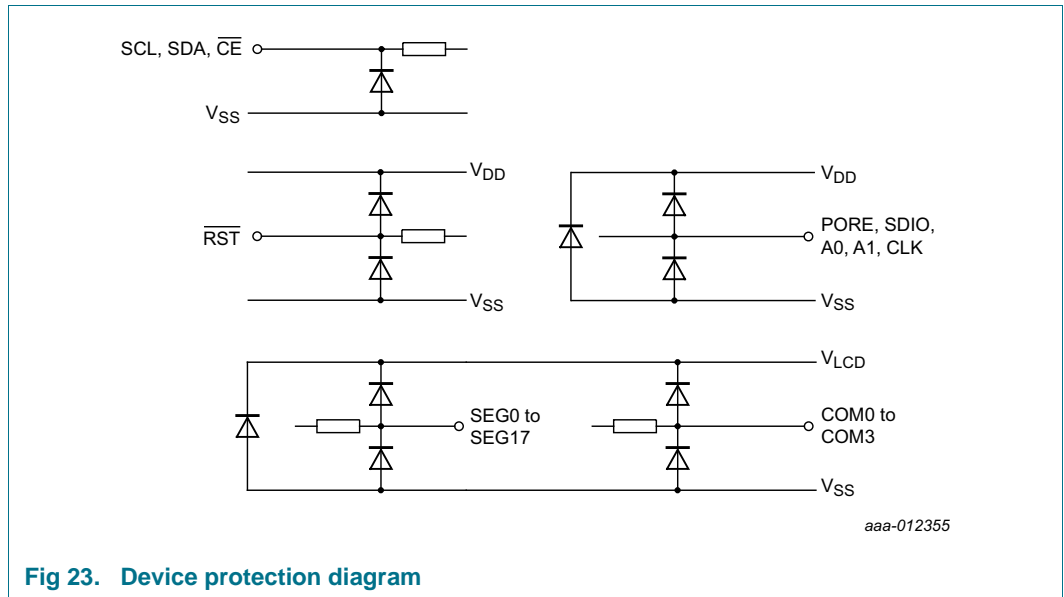

Fig 23. Device protection diagram

13. Safety notes

CAUTION

This device is sensitive to ElectroStatic Discharge (ESD). Observe precautions for handling electrostatic sensitive devices. Such precautions are described in the *ANSI/ESD S20.20*, *IEC/ST 61340-5*, *JESD625-A* or equivalent standards.

CAUTION

Static voltages across the liquid crystal display can build up when the LCD supply voltage ( $V_{LCD}$ ) is on while the IC supply voltage ( $V_{DD}$ ) is off, or vice versa. This may cause unwanted display artifacts. To avoid such artifacts,  $V_{LCD}$  and  $V_{DD}$  must be applied or removed together.

## 14. Limiting values

**Table 17. Limiting values**

In accordance with the Absolute Maximum Rating System (IEC 60134).

| Symbol               | Parameter                       | Conditions                        | Min  | Max   | Unit |

Fig 29. SPI-bus timing waveforms

## 16. Application information

### 16.1 Power-on with a slowly starting power supply

The built-in POR block acts on the rising edge of the  $V_{DD}$  supply voltage. It is designed to react to fast slopes. If the system supply starts slowly, it is recommended to initiate a software reset immediately after power-on.

### 16.2 I<sup>2</sup>C acknowledge after power-on

If the bus does not show an acknowledge at the first access, the command should be sent a second time.

### 16.3 Resistors on I/O pins

The pins A0, A1, and PORE comprise internal, latching pull-down devices, which keep these inputs at a low potential when left open. If an input is supposed to be at logic 0 potential, this pin can be either connected to  $V_{SS}$  or left open.

In case a pin is supposed to be at logic 1 potential, it must be connected to  $V_{DD}$  to avoid any cross-current during power-up. A series resistance between  $V_{DD}$  and the associated pin must not exceed 1 k $\Omega$  to ensure proper functionality.

## 17. Test information

---

### 17.1 Quality information

This product has been qualified in accordance with the Automotive Electronics Council (AEC) standard *Q100 - Failure mechanism based stress test qualification for integrated circuits*, and is suitable for use in automotive applications.

18. Package outline

HVQFN32: plastic thermal enhanced very thin quad flat package; no leads;  
32 terminals; body 5 x 5 x 0.85 mm

SOT617-3

Fig 30. Package outline SOT617-3 (HVQFN32) of PCA8561

## 19. Handling information

---

All input and output pins are protected against ElectroStatic Discharge (ESD) under normal handling. When handling Metal-Oxide Semiconductor (MOS) devices ensure that all normal precautions are taken as described in *JESD625-A*, *IEC 61340-5* or equivalent standards.

## 20. Packing information

---

### 20.1 Tape and reel information

For tape and reel packing information, see [Ref. 11 "SOT617-3\\_518" on page 48](#).

## 21. Soldering of SMD packages

---

This text provides a very brief insight into a complex technology. A more in-depth account of soldering ICs can be found in Application Note *AN10365 "Surface mount reflow soldering description"*.

### 21.1 Introduction to soldering

Soldering is one of the most common methods through which packages are attached to Printed Circuit Boards (PCBs), to form electrical circuits. The soldered joint provides both the mechanical and the electrical connection. There is no single soldering method that is ideal for all IC packages. Wave soldering is often preferred when through-hole and Surface Mount Devices (SMDs) are mixed on one printed wiring board; however, it is not suitable for fine pitch SMDs. Reflow soldering is ideal for the small pitches and high densities that come with increased miniaturization.

### 21.2 Wave and reflow soldering

Wave soldering is a joining technology in which the joints are made by solder coming from a standing wave of liquid solder. The wave soldering process is suitable for the following:

- Through-hole components
- Leaded or leadless SMDs, which are glued to the surface of the printed circuit board

Not all SMDs can be wave soldered. Packages with solder balls, and some leadless packages which have solder lands underneath the body, cannot be wave soldered. Also, leaded SMDs with leads having a pitch smaller than ~0.6 mm cannot be wave soldered, due to an increased probability of bridging.

The reflow soldering process involves applying solder paste to a board, followed by component placement and exposure to a temperature profile. Leaded packages, packages with solder balls, and leadless packages are all reflow solderable.

Key characteristics in both wave and reflow soldering are:

- Board specifications, including the board finish, solder masks and vias
- Package footprints, including solder thieves and orientation
- The moisture sensitivity level of the packages

- Package placement
- Inspection and repair
- Lead-free soldering versus SnPb soldering

### 21.3 Wave soldering

Key characteristics in wave soldering are:

- Process issues, such as application of adhesive and flux, clinching of leads, board transport, the solder wave parameters, and the time during which components are exposed to the wave
- Solder bath specifications, including temperature and impurities

### 21.4 Reflow soldering

Key characteristics in reflow soldering are:

- Lead-free versus SnPb soldering; note that a lead-free reflow process usually leads to higher minimum peak temperatures (see [Figure 31](#)) than a SnPb process, thus reducing the process window
- Solder paste printing issues including smearing, release, and adjusting the process window for a mix of large and small components on one board
- Reflow temperature profile; this profile includes preheat, reflow (in which the board is heated to the peak temperature) and cooling down. It is imperative that the peak temperature is high enough for the solder to make reliable solder joints (a solder paste characteristic). In addition, the peak temperature must be low enough that the packages and/or boards are not damaged. The peak temperature of the package depends on package thickness and volume and is classified in accordance with [Table 22](#) and [23](#)

**Table 22. SnPb eutectic process (from J-STD-020D)**

| Package thickness (mm) | Package reflow temperature (°C) |       |
|------------------------|---------------------------------|-------|
|                        | Volume (mm <sup>3</sup> )       |       |
|                        | < 350                           | ≥ 350 |
| < 2.5                  | 235                             | 220   |
| ≥ 2.5                  | 220                             | 220   |

**Table 23. Lead-free process (from J-STD-020D)**

| Package thickness (mm) | Package reflow temperature (°C) |             |        |
|------------------------|---------------------------------|-------------|--------|
|                        | Volume (mm <sup>3</sup> )       |             |        |
|                        | < 350                           | 350 to 2000 | > 2000 |
| < 1.6                  | 260                             | 260         | 260    |
| 1.6 to 2.5             | 260                             | 250         | 245    |
| > 2.5                  | 250                             | 245         | 245    |

Moisture sensitivity precautions, as indicated on the packing, must be respected at all times.

Studies have shown that small packages reach higher temperatures during reflow soldering, see [Figure 31](#).

For further information on temperature profiles, refer to Application Note AN10365 “Surface mount reflow soldering description”.

22. Footprint information

## 27. Legal information

### 27.1 Data sheet status

| Document status <sup>[1][2]</sup> | Product status <sup>[3]</sup> | Definition  |
|-----------------------------------|-------------------------------|---|
| Objective [short] data sheet      | Development                   | This document contains data from the objective specification for product development. |
| Preliminary [short] data sheet    | Qualification                 | This document contains data from the preliminary specification.                       |
| Product [short] data sheet        | Production                    | This document contains the product specification.                                     |

[1] Please consult the most recently issued document before initiating or completing a design.

[2] The term 'short data sheet' is explained in section "Definitions".

[3] The product status of device(s) described in this document may have changed since this document was published and may differ in case of multiple devices. The latest product status information is available on the Internet at URL <http://www.nxp.com>.

### 27.2 Definitions

**Draft** — The document is a draft version only. The content is still under internal review and subject to formal approval, which may result in modifications or additions. NXP Semiconductors does not give any representations or warranties as to the accuracy or completeness of information included herein and shall have no liability for the consequences of use of such information.

**Short data sheet** — A short data sheet is an extract from a full data sheet with the same product type number(s) and title. A short data sheet is intended for quick reference only and should not be relied upon to contain detailed and full information. For detailed and full information see the relevant full data sheet, which is available on request via the local NXP Semiconductors sales office. In case of any inconsistency or conflict with the short data sheet, the full data sheet shall prevail.

**Product specification** — The information and data provided in a Product data sheet shall define the specification of the product as agreed between NXP Semiconductors and its customer, unless NXP Semiconductors and customer have explicitly agreed otherwise in writing. In no event however, shall an agreement be valid in which the NXP Semiconductors product is deemed to offer functions and qualities beyond those described in the Product data sheet.

### 27.3 Disclaimers

**Limited warranty and liability** — Information in this document is believed to be accurate and reliable. However, NXP Semiconductors does not give any representations or warranties, expressed or implied, as to the accuracy or completeness of such information and shall have no liability for the consequences of use of such information. NXP Semiconductors takes no responsibility for the content in this document if provided by an information source outside of NXP Semiconductors.

In no event shall NXP Semiconductors be liable for any indirect, incidental, punitive, special or consequential damages (including - without limitation - lost profits, lost savings, business interruption, costs related to the removal or replacement of any products or rework charges) whether or not such damages are based on tort (including negligence), warranty, breach of contract or any other legal theory.

Notwithstanding any damages that customer might incur for any reason whatsoever, NXP Semiconductors' aggregate and cumulative liability towards customer for the products described herein shall be limited in accordance with the *Terms and conditions of commercial sale* of NXP Semiconductors.

**Right to make changes** — NXP Semiconductors reserves the right to make changes to information published in this document, including without limitation specifications and product descriptions, at any time and without notice. This document supersedes and replaces all information supplied prior to the publication hereof.

**Suitability for use in automotive applications** — This NXP Semiconductors product has been qualified for use in automotive applications. Unless otherwise agreed in writing, the product is not designed, authorized or warranted to be suitable for use in life support, life-critical or safety-critical systems or equipment, nor in applications where failure or malfunction of an NXP Semiconductors product can reasonably be expected to result in personal injury, death or severe property or environmental damage. NXP Semiconductors and its suppliers accept no liability for inclusion and/or use of NXP Semiconductors products in such equipment or applications and therefore such inclusion and/or use is at the customer's own risk.

**Applications** — Applications that are described herein for any of these products are for illustrative purposes only. NXP Semiconductors makes no representation or warranty that such applications will be suitable for the specified use without further testing or modification.

Customers are responsible for the design and operation of their applications and products using NXP Semiconductors products, and NXP Semiconductors accepts no liability for any assistance with applications or customer product design. It is customer's sole responsibility to determine whether the NXP Semiconductors product is suitable and fit for the customer's applications and products planned, as well as for the planned application and use of customer's third party customer(s). Customers should provide appropriate design and operating safeguards to minimize the risks associated with their applications and products.

NXP Semiconductors does not accept any liability related to any default, damage, costs or problem which is based on any weakness or default in the customer's applications or products, or the application or use by customer's third party customer(s). Customer is responsible for doing all necessary testing for the customer's applications and products using NXP Semiconductors products in order to avoid a default of the applications and the products or of the application or use by customer's third party customer(s). NXP does not accept any liability in this respect.

**Limiting values** — Stress above one or more limiting values (as defined in the Absolute Maximum Ratings System of IEC 60134) will cause permanent damage to the device. Limiting values are stress ratings only and (proper) operation of the device at these or any other conditions above those given in the Recommended operating conditions section (if present) or the Characteristics sections of this document is not warranted. Constant or repeated exposure to limiting values will permanently and irreversibly affect the quality and reliability of the device.

**Terms and conditions of commercial sale** — NXP Semiconductors products are sold subject to the general terms and conditions of commercial sale, as published at <http://www.nxp.com/profile/terms>, unless otherwise agreed in a valid written individual agreement. In case an individual agreement is concluded only the terms and conditions of the respective agreement shall apply. NXP Semiconductors hereby expressly objects to applying the customer's general terms and conditions with regard to the purchase of NXP Semiconductors products by customer.

**No offer to sell or license** — Nothing in this document may be interpreted or construed as an offer to sell products that is open for acceptance or the grant, conveyance or implication of any license under any copyrights, patents or other industrial or intellectual property rights.

**Export control** — This document as well as the item(s) described herein may be subject to export control regulations. Export might require a prior authorization from competent authorities.

**Translations** — A non-English (translated) version of a document is for reference only. The English version shall prevail in case of any discrepancy between the translated and English versions.

Please be aware that important notices concerning this document and the product(s) described herein, have been included in section 'Legal information'.

Компания «Life Electronics» занимается поставками электронных компонентов импортного и отечественного производства от производителей и со складов крупных дистрибьюторов Европы, Америки и Азии.

С конца 2013 года компания активно расширяет линейку поставок компонентов по направлению коаксиальный кабель, кварцевые генераторы и конденсаторы (керамические, пленочные, электролитические), за счёт заключения дистрибьюторских договоров

Мы предлагаем:

- Конкурентоспособные цены и скидки постоянным клиентам.
- Специальные условия для постоянных клиентов.
- Подбор аналогов.
- Поставку компонентов в любых объемах, удовлетворяющих вашим потребностям.
- Приемлемые сроки поставки, возможна ускоренная поставка.
- Доставку товара в любую точку России и стран СНГ.
- Комплексную поставку.
- Работу по проектам и поставку образцов.
- Формирование склада под заказчика.
- Сертификаты соответствия на поставляемую продукцию (по желанию клиента).
- Тестирование поставляемой продукции.
- Поставку компонентов, требующих военную и космическую приемку.
- Входной контроль качества.
- Наличие сертификата ISO.

В составе нашей компании организован Конструкторский отдел, призванный помогать разработчикам, и инженерам.

Конструкторский отдел помогает осуществить:

- Регистрацию проекта у производителя компонентов.
- Техническую поддержку проекта.
- Защиту от снятия компонента с производства.
- Оценку стоимости проекта по компонентам.
- Изготовление тестовой платы монтаж и пусконаладочные работы.
