## PWM/VFM step-down DC/DC Controller

## OUTLINE

The R1223N Series are CMOS-based PWM step-down DC/DC Converter controllers with low supply current.

Each of these ICs consists of an oscillator, a PWM control circuit, a reference voltage unit, an error amplifier, a soft-start circuit, a protection circuit, a PWM/VFM alternative circuit, a chip enable circuit, and resistors for voltage detection. A low ripple, high efficiency step-down DC/DC converter can be easily composed of this IC with only four external components, or a power-transistor, an inductor, a diode and a capacitor.

With a PWM/VFM alternative circuit, when the load current is small, the operation is automatically switching into the VFM oscillator from PWM oscillator, therefore the efficiency at small load current is improved. The R1223NxxxB type, which is without a PWM/VFM alternative circuit, is also available.

If the term of maximum duty cycle keeps on a certain time, the embedded protection circuit works. There are two types of protection function. One is latch-type protection circuit, and it works to latch an external Power MOSFET with keeping it disable. To release the condition of protection, after disable this IC with a chip enable circuit, enable it again, or restart this IC with power-on. The other is Reset-type protection circuit, and it works to restart the operation with soft-start and repeat this operation until maximum duty cycle condition is released. Either of these protection circuits can be designated by users' request.

## FEATURES

- Input Voltage Range ..................................................... 2.3V to 13.2V
- Output Voltage Range ................................................. 1.5V to 5.0V (0.1V step)
- Output Voltage Accuracy ............................................ ±2.0%
- Oscillator Frequency ................................................... 300kHz, 500kHz
- High Efficiency .......................................................... Typ. 90%
- Standby Current ........................................................ Typ. 0µA
- Temperature-Drift Coefficient of Output Voltage .......... Typ. ±100ppm/°C
- Built-in Soft-start Circuit
- Built-in Latch-type or Reset type Protection Circuit
- Package .................................................................... SOT-23-5

## APPLICATION

- Power source for hand-held communication equipment, cameras, video instruments such as VCRs, camcorders.
- Power source for battery-powered equipment.
- Power source for household electrical appliances.

## BLOCK DIAGRAM

## SELECTION GUIDE

In the R1223N Series, the output voltage, the oscillator frequency, switching mode and type of short protection (Latch or Reset) for the IC are selectable at the user's request.

| Product Name | Package | Quantity per Reel | Pb Free | Halogen Free |
|---|---|---|---|---|
| R1223Nxx2∗-TR-FE | SOT-23-5 | 3,000pcs | Yes | Yes |

xx : The output voltage can be designated in the range from 1.5V(15) to 5.0V(50) in 0.1V[*1] steps.

∗ : Designation of the oscillator frequency, switching mode and type of short protection.

   A) 300kHz, with a PWM/VFM alternative circuit, Latch-type protection

   B) 500 kHz, with a PWM/VFM alternative circuit, Latch-type protection

   C) 300kHz, without a PWM/VFM alternative circuit, Latch-type protection

   D) 500kHz, without a PWM/VFM alternative circuit, Latch-type protection

   E) 300kHz, with a PWM/VFM alternative circuit, Reset-type protection

   F) 500 kHz, with a PWM/VFM alternative circuit, Reset-type protection

   G) 300kHz, without a PWM/VFM alternative circuit, Reset-type protection

   H) 500kHz, without a PWM/VFM alternative circuit, Reset-type protection

| $T_{stg}$ | Storage Temperature Range | -55 to 125 | °C |

[1] For Power Dissipation and Standard Test Land Pattern, please refer to PACKAGE INFORMATION.

| ABSOLUTE MAXIMUM RATINGS |
|---|
| Electronic and mechanical stress momentarily exceeded absolute maximum ratings may cause the permanent damages and may degrade the life time and safety for both device and system using the device in the field. The functional operation at or over these absolute maximum ratings is not assured. |

| RECOMMENDED OPERATING CONDITIONS (ELECTRICAL CHARACTERISTICS) |
|---|
| All of electronic equipment should be designed that the mounted semiconductor devices operate within the recommended operating conditions. The semiconductor devices cannot operate normally over the recommended operating conditions, even if when they are used over such conditions by momentary electronic noise or surge. And the semiconductor devices may receive serious damage when they continue to operate over the recommended operating conditions. |

## TYPICAL APPLICATIONS AND APPLICATION HINTS

PMOS : HAT1020R (Hitachi), Si3443DV (Siliconix)   L   : CD105 (Sumida, $27\mu H$)

SD1   : RB491D (Rohm)                              $C_{OUT}$ : $47\mu F$ (Tantalum Type)

$C_{IN}$   : $10\mu F \times 2$ (Tantalum Type)

When you use these ICs, consider the following issues;

- As shown in the block diagram, a parasitic diode is formed in each terminal, each of these diodes is not formed for load current, therefore do not use it in such a way. When you control the CE pin by another power supply, do not make its "H" level more than the voltage level of $V_{IN}$ pin.

- The operation of latch-type protection circuit is as follows;
  When the maximum duty cycle continues longer than the delay time for protection circuit, (Refer to the Electrical Characteristics) the protection circuit works to shut-down Power MOSFET with its latching operation. Therefore when an input/output voltage difference is small, the protection circuit may work with small load current.
  To release the protection latch state, after disable this IC with a chip enable circuit, enable it again, or restart this IC with power-on. However, in the case of restarting this IC with power-on, after the power supply is turned off, if a certain amount of charge remains in $C_{IN}$, or some voltage is forced to $V_{IN}$ from $C_{IN}$, this IC might not be restarted even after power-on.
  If rising transition speed of supply voltage is too slow, or the time which is required for $V_{IN}$ voltage to reach Output voltage of DC/DC converter is longer than soft-starting time plus delay time for protection circuit, protection circuit works before $V_{IN}$ voltage reaches Output voltage of DC/DC converter. To prevent this action, while power supply voltage is not ready, make this IC be standby mode (CE="L"), and when the power supply is ready (the voltage level of $V_{IN}$ is equal or more than the voltage level of $V_{OUT}$), make it enable (CE="H").

- The operation of Reset-type protection circuit is as follows;
  When the maximum duty cycle continues longer than the delay time for protection circuit, (Refer to the Electrical Characteristics) the protection circuit works to restart with soft-start operation. Therefore when an input/output voltage difference is small, the protection circuit may work with small load current.

- Set external components as close as possible to the IC and minimize the connection between the components and the IC. In particular, a capacitor should be connected to $V_{OUT}$ pin with the minimum connection. And make sufficient grounding and reinforce supplying. A large switching current flows through the connection of power supply, an inductor and the connection of $V_{OUT}$. If the impedance of the connection of power supply is high, the voltage level of power supply of the IC fluctuates with the switching current. This may cause unstable operation of the IC.

- Use capacitors with a capacity of $22\mu F$ or more for $V_{OUT}$ pin, and with good high frequency characteristics such as tantalum capacitors. We recommend you to use capacitors with an allowable voltage which is at least twice as much as setting output voltage. This is because there may be a case where a spike-shaped high voltage is generated by an inductor when an external transistor is on and off.

- Choose an inductor that has sufficiently small DC resistance and large allowable current and is hard to reach magnetic saturation. And if the value of inductance of an inductor is extremely small, the $I_{LX}$ may exceed the absolute maximum rating at the maximum loading.
  Use an inductor with appropriate inductance.

- Use a diode of a Schottky type with high switching speed, and also pay attention to its current capacity.

- Do not use this IC under the condition at $V_{IN}$ voltage less than minimum operating voltage.

☆ The performance of power source circuits using these ICs extremely depends upon the peripheral circuits.
  Pay attention in the selection of the peripheral circuits. In particular, design the peripheral circuits in a way that

RICOH

the values such as voltage, current, and power of each component, PCB patterns and the IC do not exceed their respected rated values.

# OPERATION of step-down DC/DC converter and Output Current

The step-down DC/DC converter charges energy in the inductor when Lx transistor is ON, and discharges the energy from the inductor when Lx transistor is OFF and controls with less energy loss, so that a lower output voltage than the input voltage is obtained. The operation will be explained with reference to the following diagrams :

<Basic Circuits>                                                  <Current through L>

Step 1 : LxTr turns on and current IL (=i1) flows, and energy is charged into CL. At this moment, IL increases from ILmin (=0) to reach ILmax in proportion to the on-time period (ton) of LxTr.

Step 2 : When LxTr turns off, Schottky diode (SD) turns on in order that L maintains IL at ILmax, and current IL (=i2) flows.

Step 3 : IL decreases gradually and reaches ILmin after a time period of topen, and SD turns off, provided that in the continuous mode, next cycle starts before IL becomes to 0 because toff time is not enough. In this case, IL value increases from this ILmin (>0).

In the case of PWM control system, the output voltage is maintained by controlling the on-time period (ton), with the oscillator frequency (fosc) being maintained constant.

- **Discontinuous Conduction Mode and Continuous Conduction Mode**

The maximum value (ILmax) and the minimum value (ILmin) of the current which flows through the inductor are the same as those when LxTr is ON and when it is off.

The difference between ILmax and ILmin, which is represented by $\Delta I$ ;

$$\Delta I = ILmax - ILmin = V_{OUT} \times topen/L = (V_{IN} - V_{OUT}) \times ton/L \dots\dots\dots\dots \text{Equation 1}$$

wherein $T = 1/fosc = ton + toff$

      duty $(\%) = ton/T \times 100 = ton \times fosc \times 100$

      $topen \leq toff$

In Equation 1, $V_{OUT} \times topen/L$ and $(V_{IN}-V_{OUT}) \times ton/L$ respectively show the change of the current at on state, and the change of the current at off state.

When the output current ($I_{OUT}$) is relatively small, topen<toff as illustrated in the above diagram. In this case, the energy is charged in the inductor during the time period of ton and is discharged in its entirely during the time period of toff, therefore ILmin becomes to zero (ILmin=0). When $I_{OUT}$ is gradually increased, eventually, topen becomes to toff (topen=toff), and when $I_{OUT}$ is further increased, ILmin becomes larger than zero (ILmin>0). The former mode is referred to as the discontinuous mode and the latter mode is referred to as continuous mode.

In the continuous mode, when Equation 1 is solved for ton and assumed that the solution is tonc,

$$tonc = T \times V_{OUT}/V_{IN} \quad\text{............................................................................................ Equation 2}$$

When ton<tonc, the mode is the discontinuous mode, and when ton=tonc, the mode is the continuous mode.

## Output Current and Selection of External Components

When LxTr is ON:

(Wherein, Ripple Current P-P value is described as $I_{RP}$, ON resistance of LXTr is described as $R_P$ the direct current resistance of the inductor is described as $R_L$.)

$$V_{IN} = V_{OUT} + (R_P + R_L) \times I_{OUT} + L \times I_{RP}/ton \quad\text{.................................................................. Equation 3}$$

When LxTr is OFF:

$$L \times I_{RP}/toff = V_F + V_{OUT} + R_L \times I_{OUT} \quad\text{.......................................................................... Equation 4}$$

Put Equation 4 to Equation 3 and solve for ON duty, ton/(toff+ton)=$D_{ON}$,

$$D_{ON} = (V_{OUT} + V_F + R_L \times I_{OUT})/(V_{IN} + V_F - R_P \times I_{OUT}) \quad\text{...................................................... Equation 5}$$

Ripple Current is as follows;

$$I_{RP} = (V_{IN} - V_{OUT} - R_P \times I_{OUT} - R_L \times I_{OUT}) \times D_{ON}/f/L \quad\text{............................................................ Equation 6}$$

wherein, peak current that flows through L, LxTr, and SD is as follows;

$$ILmax = I_{OUT} + I_{RP}/2 \quad\text{................................................................................................ Equation 7}$$

Consider ILmax, condition of input and output and select external components.

RICOH

★ The above explanation is directed to the calculation in an ideal case in continuous mode.

# External Components

1. Inductor

Select an inductor that peak current does not exceed ILmax. If larger current than allowable current flows, magnetic saturation occurs and make transform efficiency worse.

When the load current is same, the smaller value of L is used, the larger the ripple current is.

Provided that the allowable current is large in that case and DC current is small, therefore, for large output current, efficiency is better than using an inductor with a large value of L and vice versa.

2. Diode

Use a diode with low $V_F$ (Schottky type is recommended.) and high switching speed.

Reverse voltage rating should be more than $V_{IN}$ and current rating should be equal or more than ILmax.

3. Capacitor

As for $C_{IN}$, use a capacitor with low ESR (Equivalent Series Resistance) and a capacity of at least $10\mu F$ for stable operation.

$C_{OUT}$ can reduce ripple of Output Voltage, therefore 47 to $100\mu F$ tantalum type is recommended.

4. Lx Transistor

Pch Power MOS FET is required for this IC.

Its breakdown voltage between gate and source should be a few volt higher than Input Voltage.

In the case of Input Voltage is low, to turn on MOS FET completely, select a MOS FET with low threshold voltage.

If a large load current is necessary for your application and important, choose a MOS FET with low ON resistance for good efficiency.

If a small load current is mainly necessary for your application, choose a MOS FET with low gate capacity for good efficiency.

Maximum continuous drain current of MOS FET should be larger than peak current, ILmax.

Компания «Life Electronics» занимается поставками электронных компонентов импортного и отечественного производства от производителей и со складов крупных дистрибьюторов Европы, Америки и Азии.

С конца 2013 года компания активно расширяет линейку поставок компонентов по направлению коаксиальный кабель, кварцевые генераторы и конденсаторы (керамические, пленочные, электролитические), за счёт заключения дистрибьюторских договоров

Мы предлагаем:

- Конкурентоспособные цены и скидки постоянным клиентам.
- Специальные условия для постоянных клиентов.
- Подбор аналогов.
- Поставку компонентов в любых объемах, удовлетворяющих вашим потребностям.

- Приемлемые сроки поставки, возможна ускоренная поставка.
- Доставку товара в любую точку России и стран СНГ.
- Комплексную поставку.
- Работу по проектам и поставку образцов.
- Формирование склада под заказчика.

- Сертификаты соответствия на поставляемую продукцию (по желанию клиента).
- Тестирование поставляемой продукции.
- Поставку компонентов, требующих военную и космическую приемку.
- Входной контроль качества.
- Наличие сертификата ISO.

В составе нашей компании организован Конструкторский отдел, призванный помогать разработчикам, и инженерам.

Конструкторский отдел помогает осуществить:

- Регистрацию проекта у производителя компонентов.
- Техническую поддержку проекта.
- Защиту от снятия компонента с производства.
- Оценку стоимости проекта по компонентам.
- Изготовление тестовой платы монтаж и пусконаладочные работы.
