Description

The PI90LV02 and PI90LVT02 are single differential line receivers that use low-voltage differential signaling (LVDS) to support data rates up to 400 Mbps. These products are designed for applications requiring high-speed, low-power consumption, low-noise generation, and a small package.

A differential input signal (350mV) is translated by the device to a 3.3V CMOS output level. The PI90LVT02 integrates the terminating resistor while the PI90LV02 requires an external resistor.

Applications

Applications include point-to-point and multi-drop baseband data transmissions over impedance media of approximately 100-ohms. The transmission media can be printed circuit board traces, backplanes, or cables.

The PI90LV02 and PI90LVT02 and companion line drivers (PI90LV01 and PI90LVB01) provide new alternatives to RS-232, PECL, and ECL devices for high-speed, point-to-point interface applications.
