Description

The MAAM-011185 is a balanced GaAs MMIC amplifier assembled in a lead-free 3 mm 16-lead PQFN plastic package.

The amplifier is ideally suited for use in CATV return path applications, including DOCSIS 3.1 systems: it offers low distortion and low noise figure with high gain. It typically provides 3.1 dB noise figure, 21.2 dB gain, and 30 dB MER up to 57 dBmV per channel for 16-Channel 64 QAM signaling while drawing 290 mA DC current @ 5 V bias.

5. Modulation Error Ratio, 64 QAM 5.12 MS/s. See 'Typical Performance Curves' on page 5 of this datasheet for an example MER vs. output power relationship.

6. Data corresponds to the typical application circuit and component values shown on page 3 of this datasheet. Parameters shown at nominal $I_{CC} = 290\text{ mA}$ unless otherwise noted. I_{CC} is the total DC current draw from the V_{CC} supply. As shown on page 3, it is distributed to pins 9 and 12 by balun T2 and pins 10 and 11 directly. Resistor R2 determines the DC voltage of $A_{BIAS/A/B}$ and thereby I_{CC} at approximately $0.25\text{ mA}/\Omega$. See page 5 for a typical I_{CC} vs. $R2$ relationship assuming $V_{CC} = 5\text{ V}$.

Absolute Maximum Ratings^{7,8}

Parameter	Absolute Maximum
Input Power	11 dBm
V_{CC}	6 V
Junction Temperature ^{9,10}	+150°C
Operating Temperature	-40°C to +85°C
Storage Temperature	-65°C to +125°C

7. Exceeding any one or a combination of these limits may cause permanent damage to this device.

8. MACOM does not recommend sustained operation near these survivability limits.

9. Operating at nominal conditions with $T_J \leq 150^\circ\text{C}$ will ensure $MTTF > 1 \times 10^6$ hours.

10. Junction Temperature (T_J) = $T_C + \Theta_{jc} * (V * I)$
Typical thermal resistance (Θ_{jc}) = $15^\circ\text{C}/\text{W}$.

a) For $T_C = +25^\circ\text{C}$, $T_J = 47^\circ\text{C}$ @ 5 V, 290 mA

b) For $T_C = +85^\circ\text{C}$, $T_J = 107^\circ\text{C}$ @ 5 V, 290 mA

Handling Procedures

Please observe the following precautions to avoid damage:

Static Sensitivity

Gallium Arsenide Integrated Circuits are sensitive to electrostatic discharge (ESD) and can be damaged by static electricity. Proper ESD control techniques should be used when handling these devices.
