

FEATURES

- RF frequency: 700 MHz to 3000 MHz, continuous
- LO input frequency: 200 MHz to 2700 MHz, high-side or low-side injection
- IF range: 40 MHz to 500 MHz
- Power conversion gain of 9.0 dB
- Phase noise performance of -144 dBc/Hz at 800 kHz offset supporting stringent GSM standards in both 800 MHz to 900 MHz and 1800 MHz to 1900 MHz bands
- Single-sideband (SSB) noise figure of 11.3 dB
- Input IP3 of 30 dBm
- Input P1dB of 10.6 dBm
- Typical LO input drive of 0 dBm
- Single-ended, 50 Ω RF port
- Single-ended or balanced LO input port
- Serial port interface (SPI) control on all functions
- Exposed pad, 7 mm \times 7 mm, 48-lead LFCSP

APPLICATIONS

- Multiband/multistandard cellular base station diversity receivers
- Wideband radio link diversity downconverters
- Multimode cellular extenders and picocells

GENERAL DESCRIPTION

The **ADRF6614** is a dual radio frequency (RF) mixer and intermediate frequency (IF) amplifier with an integrated phase-locked loop (PLL) and voltage controlled oscillators (VCOs). The **ADRF6614** uses revolutionary broadband square wave limiting local oscillator (LO) amplifiers to achieve a wideband RF bandwidth of 700 MHz to 3000 MHz. Unlike narrow-band sine wave LO amplifier solutions, the LO can be applied above or below the RF input over a wide bandwidth. Energy storage elements are not utilized in the LO amplifier, thus dc current consumption also decreases with decreasing LO frequency.

The **ADRF6614** utilizes highly linear, doubly balanced passive mixer cores with integrated RF and LO balancing circuits to allow single-ended operation. Integrated RF baluns allow optimal performance over the 700 MHz to 3000 MHz RF input frequency. The balanced passive mixer arrangement provides outstanding LO to RF and LO to IF leakages, excellent RF to IF isolation, and excellent intermodulation performance over the full RF bandwidth.

The balanced mixer cores provide extremely high input linearity, allowing the device to be used in demanding wideband applications where in-band blocking signals may otherwise result in the degradation of dynamic range. Noise performance under blocking is comparable to narrow-band passive mixer designs. High linearity

FUNCTIONAL BLOCK DIAGRAM

Figure 1.

IF buffer amplifiers follow the passive mixer cores, yielding typical power conversion gains of 9.0 dB, and can be matched to a wide range of output impedances.

The PLL architecture supports both integer-N and fractional-N operation and can generate the entire LO frequency range of 200 MHz to 2700 MHz using an external reference input frequency anywhere in the range of 12 MHz to 320 MHz. An external loop filter provides flexibility in trading off phase noise vs. acquisition time. To reduce fractional spurs in fractional-N mode, a Σ - Δ modulator controls the post VCO-programmable divider. The device integrates six VCO cores, four of which provide complete frequency coverage between 200 MHz and 2700 MHz, and meet the GSM phase noise requirements in the 800 MHz and 900 MHz bands. Two additional GSM only cores enable the **ADRF6614** to meet the GSM phase noise requirements in the digital cellular system 1800 MHz (DCS1800) and personal communications service 1900 MHz (PCS1900) bands.

All features of the **ADRF6614** are controlled via a 3-wire SPI, resulting in optimum performance and minimum external components.

The **ADRF6614** is fabricated using a BiCMOS, high performance IC process. The device is available in a 7 mm \times 7 mm, 48-lead LFCSP package and operates over a -40°C to $+85^{\circ}\text{C}$ temperature range. An evaluation board is available.

ABSOLUTE MAXIMUM RATINGS

Table 8.

Parameter	Rating
Supply Voltage (VCC1, VCC2, VCC3, VCC4, VCC5, VCC6, VCC7, VCC8, VCC9, VCC10, VCC11, VCC12, IFOUT1+, IFOUT1-, IFOUT2+, IFOUT2-)	-0.5 V to +5.5 V
Digital Input/Output (SCLK, SDIO, \overline{CS})	-0.3 V to +3.6 V
RFINx	20 dBm
EXTVCOIN+, EXTVCOIN-	13 dBm
Maximum Junction Temperature	150°C
Operating Temperature Range	-40°C to +85°C
Storage Temperature Range	-65°C to +150°C

Stresses at or above those listed under Absolute Maximum Ratings may cause permanent damage to the product. This is a stress rating only; functional operation of the product at these or any other conditions above those indicated in the operational section of this specification is not implied. Operation beyond the maximum operating conditions for extended periods may affect product reliability.

THERMAL RESISTANCE

θ_{JC} is specified for the worst case conditions, that is, a device soldered in a circuit board for surface-mount packages.

Table 9. Thermal Resistance

Package Type	θ_{JC}	Unit
48-Lead LFCSP	1.62	°C/W

ESD CAUTION

ESD (electrostatic discharge) sensitive device. Charged devices and circuit boards can discharge without detection. Although this product features patented or proprietary protection circuitry, damage may occur on devices subjected to high energy ESD. Therefore, proper ESD precautions should be taken to avoid performance degradation or loss of functionality.

PIN CONFIGURATION AND FUNCTION DESCRIPTIONS

- NOTES
1. DNC = DO NOT CONNECT.
 2. THE EXPOSED PAD MUST BE CONNECTED TO A GROUND PLANE WITH LOW THERMAL IMPEDANCE.

14115-003

Figure 3. Pin Configuration

Table 10. Pin Function Descriptions

Pin No.	Mnemonic	Description
1	GND	Common Ground Connection for External Loop Filter.
2	VCOVTUNE	Control Voltage for Internal VCO.
3, 6	GND	Common Ground for External VCO.
4, 5	EXTVCOIN+, EXTVCOIN-	Inputs from External VCO to Internal Divider.
7	VCC1	3.7 V VCO Supply.
8, 9	DECL1, DECL2	LDO Output Decouplers for VCO.
10, 11	DECL3, DECL4	External Decouplers for VCO Buffer.
12	DECL5	External Decoupler for VCO Circuitry.
13, 14	LOOUT+, LOOUT-	Differential Outputs of Internally Generated LO.
15	LDO1	External Decoupling for Internal 2.5 V SPI Port LDO.
16	VCC2	3.7 V Supply for Programmable SPI Port.
17	SDIO	Serial Data Input/Output for Programmable SPI Port.
18	SCLK	Clock for Programmable SPI Port.
19	\overline{CS}	SPI Chip Select, Active Low.
20, 41	VCC3, VCC11	5 V Biases for Channel 1 and Channel 2 IF.
21, 40	DNC	Do Not Connect. Do not connect these pins externally.
22, 23	IFOUT2+, IFOUT2-	Channel 2 Differential IF Outputs.
24, 37	GND	Ground Connections for Channel 1 and Channel 2 IF Stage.
25	RFBCT2	Balun Center Tap Connection for Channel 2 RF Input.
26	RFIN2	Channel 2 RF Input.
27, 28, 29	VCC4, VCC5, VCC6	5 V Supplies for Mixer LO Amplifiers.
30	LDO2	External Decoupling for Internal 3.3 V PLL/Divider LDO.
31	VCC7	3.7 V Supply for Mixer LO Divider Chain.
32, 33, 34	VCC8, VCC9, VCC10	5 V Supplies for Mixer LO Amplifiers.
35	RFIN1	Channel 1 RF Input.
36	RFBCT1	Balun Center Tap Connection for Channel 1 RF Input.
38, 39	IFOUT1-, IFOUT1+	Channel 1 Differential IF Outputs.
42	MUXOUT	Internal Multiplexer Output.

Pin No.	Mnemonic	Description
43	REFIN	Reference Input for Internal PLL (Single-Ended, CMOS).
44	LDO3	External Decoupling for Internal 2.5 V PLL LDO.
45	LDO4	External Decoupling for Internal 3.3 V PLL LDO.
46	VCC12	3.7 V Supply for Internal PLL.
47	CPOUT	Charge Pump Output.
48	GND	Common Ground for External Charge Pump.
	EPAD	Exposed Pad. The exposed pad must be connected to a ground plane with low thermal impedance.

TYPICAL PERFORMANCE CHARACTERISTICS

MIXER, HIGH PERFORMANCE MODE

$T_A = 25^\circ\text{C}$, $f_{RF} = 1900\text{ MHz}$, $f_{LO} = 1697\text{ MHz}$, $Z_O = 50\ \Omega$, $f_{REF} = 122.88\text{ MHz}$, $f_{REF}\text{ power} = 4\text{ dBm}$, low-side LO injection, optimum RFB and LPF settings, unless otherwise noted. For integer mode: $f_{FPD} = 1.536\text{ MHz}$, $CSCALE = 8\text{ mA}$, $bleed = 0\ \mu\text{A}$, $ABLDLY = 0.9\text{ ns}$. For fractional mode: $f_{FPD} = 30.72\text{ MHz}$, $CSCALE = 250\ \mu\text{A}$, $bleed = 93.75\ \mu\text{A}$, $ABLDLY = 0.0\text{ ns}$.

SPURIOUS PERFORMANCE

($N \times f_{RF}$) – ($M \times f_{LO}$) spur measurements were made using the standard evaluation board. Mixer spurious products are measured in dBc from the IF output power level. Data was measured only for frequencies less than 6 GHz; blank cells indicate frequencies that were not measured. Typical noise floor of the measurement system = –100 dBm.

High Performance Mode

V_S = high performance mode, T_A = 25°C, Z_O = 50 Ω, f_{REF} = 122.88 MHz, f_{REF} power = 4 dBm, f_{PFD} = 1.536 MHz, low-side LO injection, optimum RFB and LPF settings, unless otherwise noted.

THEORY OF OPERATION

The ADRF6614 consists of two primary components: the RF subsystem and the LO subsystem. The combination of design, process, and packaging technology allows the functions of these subsystems to be integrated into a single die, using mature packaging and interconnection technologies to provide a high performance device with excellent electrical, mechanical, and thermal properties. The wideband frequency response and flexible frequency programming simplifies the receiver design, saves on-board space, and minimizes the need for external components.

The RF subsystem consists of an integrated, tunable, low loss RF balun, a double balanced, passive MOSFET mixer, a tunable sum termination network, and an IF amplifier.

The LO subsystem consists of a multistage, limiting LO amplifier. The purpose of the LO subsystem is to provide a large, fixed amplitude, balanced signal to drive the mixer independent of the level of the LO input. A schematic of the device is shown in Figure 110.

RF SUBSYSTEM

The single-ended, 50 Ω RF input is internally transformed to a balanced signal using a tunable, low loss, unbalanced to balanced (balun) transformer. This transformer is made possible by an extremely low loss metal stack, which provides both excellent balance and dc isolation for the RF port. Although the port can be dc connected, it is recommended to use a blocking capacitor to avoid running excessive dc current through the device. The RF balun can easily support an RF input frequency range of 700 MHz to 3000 MHz. This balun is tuned over the frequency range by a SPI controlled switched capacitor network at the output of the RF balun.

The resulting balanced RF signal is applied to a passive mixer that commutates the RF input in accordance with the output of the LO subsystem. The passive mixer is a balanced, low loss switch that adds minimum noise to the frequency translation. The only noise contribution from the mixer is due to the resistive loss of the switches, which is in the order of a few ohms.

The IF amplifier is a balanced feedback design that simultaneously provides the gain, noise figure, and input impedance required to achieve the overall performance. The balanced open-collector output of the IF amplifier, with an impedance modified by the feedback within the amplifier, permits the output to be connected directly to a high impedance filter, a differential amplifier, or an

analog-to-digital converter (ADC) input while providing optimum second-order intermodulation suppression. The differential output impedance of the IF amplifier is approximately 200 Ω. If operation in a 50 Ω system is desired, the output can be transformed to 50 Ω by using a 4:1 transformer or an LC impedance matching network.

EXTERNAL LO GENERATION

The ADRF6614 LO can be generated by an externally applied source or by using the internal PLL synthesizer. To select the external LO mode, write 011 to Register 0x22, Bits[2:0] and apply the differential LO signal to Pin 4 (EXTVCOIN+) and Pin 5 (EXTVCOIN-).

Internal dividers allow the externally applied LO signal to be divided before this signal arrives at the mixer LO input. The divider value is set by Register 0x22, Bits[5:3] and has possible values of 1, 2, 4, and 8. With the divider set to 1, the externally applied LO input frequency range is 250 MHz to 2850 MHz. When using a divider value of other than 1, the maximum externally applied LO frequency is 5700 MHz.

The external LO input pins present a broadband differential 50 Ω input impedance. The EXTVCOIN+ and EXTVCOIN- input pins must be ac-coupled. When not in use, EXTVCOIN+ and EXTVCOIN- can be left unconnected.

INTERNAL LO GENERATION

Reference Input Circuitry

The ADRF6614 includes an on-chip PLL for LO synthesis. The PLL, shown in Figure 109, consists of a reference input and input dividers, a PFD, a charge pump, VCOs, and a programmable fractional/integer divider with a 2× prescaler.

The reference path takes in a reference clock and divides it by a factor of 1 to 8191 before passing it to the PFD. The PFD compares this signal to the divided down signal from the VCO. Depending on the PFD polarity selected, the PFD sends an up or down signal to the charge pump if the VCO signal is slow or fast compared to the reference frequency. The charge pump sends a current pulse to the off-chip loop filter to increase or decrease the tuning voltage (VCOVTUNE).

Figure 109. LO Generation Block Diagram

In-band (within the band of the loop filter) phase noise performance is typically limited by the reference source. Due to the inherent phase noise reduction when performing frequency division, improved in-band phase noise performance can be achieved with higher reference divide values. However, the divide chain adds its own small amount of phase noise; thus, there is a limit on how much improvement can be gained by increasing the divider value.

Loop Filters

Defining a loop filter for the [ADRF6614](#) depends on several dynamic: the PLL REFIN and PFD frequency and desired PFD and fractional spur levels. Higher reference and PFD frequencies spread the PFD spurs over a wider bandwidth (wider separation between spurs), but also lead to higher levels of spurs coupling through the reference divider chain. Lower reference and PFD frequencies lower the spacing between PFD spurs, but the spur levels can be significantly improved by using lower frequencies. At lower PFD frequencies, it may also be possible to achieve the desired synthesizer frequency step size using the integer divider mode, therefore eliminating the risk of fractional spurs. Table 17 shows the recommended loop filter components and dynamic loop settings when using integer mode and PFD frequencies at less than 10 MHz.

Table 17. Integer Mode Loop Filter Components and PLL Dynamic Settings

Loop Filter Components	PLL Dynamic Settings
C18	1500 pF
R7	910 Ω
C20	33 nF
R8	1.8 k Ω
C22	560 pF
R10	20 k Ω
C23	39 pF
CSCALE	8000 μ A
Bleed Current	0 μ A
ABLDLY	0.9 ns

If a smaller frequency step size is desired, the [ADRF6614](#) can be used in fractional mode. The 16-bit FRAC_DIV and MOD_DIV values available in the [ADRF6614](#) mean that small step sizes can be achieved with high PFD frequencies. PFD spurs may be higher in amplitude, but are spaced further apart. Fractional spurs may be present as well.

Table 18. Fractional Mode Loop Filter Components and PLL Dynamic Settings

Loop Filter Components	PLL Dynamic Settings
C18	1000 pF
R7	700 Ω
C20	33 nF
R8	1.8 k Ω
C22	560 pF
R10	20 k Ω
C23	39 pF
CSCALE	500 μ A
Bleed Current	93.75 μ A
ABLDLY	0 ns

For GSM mode of operation at the PFD rate of 1.536 MHz, the recommended loop filter components and dynamic loop settings are shown in Table 19.

Table 19. GSM Mode Loop Filter Components and PLL Dynamic Settings

Loop Filter Components	PLL Dynamic Settings
C18	2200 pF
R7	1.2 k Ω
C20	47 nF
R8	1 k Ω
C22	1200 pF
R10	6.2 k Ω
C23	330 pF
CSCALE	8 mA
Bleed Current	0 μ A
ABLDLY	0.9 ns

VCOs and Dividers

The [ADRF6614](#) has six internal VCOs. Considering the range of these VCOs, the fixed 2 \times prescaler after the VCO, and the LO_DIV (1, 2, 4, 8, 16, and 32) range, the total LO range allows an RF generation of 200 MHz to 2700 MHz.

Table 20. VCO Range

VCO_SEL (Register 0x22, Bits[2:0])	Frequency Range (GHz)
000	4.6 to 5.7
001	4.02 to 4.6
010	3.5 to 4.02
011	2.85 to 3.5
100	3.050 to 3.094
101	3.336 to 3.416

For the VCO_0, VCO_1, VCO_2, and VCO_3 selections, it is required to set VTUNE_DAC_SLOPE (Register 0x49, Bits[13:9]) = 11d, VTUNE_DAC_OFFSET (Register 0x49, Bits[8:0]) = 184d, VCO_LDO_R2 (Register 0x22, Bits[11:8]) = 0d, and VCO_LDO_R4 (Register 0x22, Bits[15:12]) = 5d. For VCO_4 and VCO_5 selections, the required settings are VTUNE_DAC_SLOPE (Register 0x49, Bits[13:9]) = 9d, VTUNE_DAC_OFFSET (Register 0x49, Bits[8:0]) = 171d, VCO_LDO_R2 (Register 0x22, Bits[11:8]) = 2d, and VCO_LDO_R4 (Register 0x22, Bits[15:12]) = 10d. In transitioning from a GSM VCO (VCO_4 and VCO_5) to an octave VCO, the LDO settings must be changed before changing the VCO selection.

The N-divider divides down the differential VCO signal to the PFD frequency. The N-divider can be configured for fractional mode or integer mode by addressing the DIV_MODE bit (Register 0x02, Bit 15). The default configuration is set for fractional mode.

The following equations can be used to determine the N value and the PLL frequency:

$$f_{PFD} = \frac{f_{VCO}}{2 \times N}$$

where:

f_{PFD} is the phase frequency detector frequency.

f_{VCO} is the voltage controlled oscillator frequency.

N is the fractional divide ratio.

$$N = INT + \frac{FRAC}{MOD}$$

where:

INT is the integer divide ratio programmed in Register 0x02.

$FRAC$ is the fractional divide ratio programmed in Register 0x03.

MOD is the modulus divide ratio programmed in Register 0x04.

$$f_{LO} = \frac{f_{PFD} \times 2 \times N}{LO_DIVIDER}$$

where:

f_{LO} is the LO frequency going to the mixer core when the loop is locked.

$LO_DIVIDER$ is the final divider block that divides the VCO frequency down by 1, 2, 4, or 8 before it reaches the mixer (see Table 21). This control is located in the LO_DIV bits (Register 0x22, Bits[5:3]).

Table 21. LO Divider

LO_DIV (Register 0x22, Bits[5:3])	LO_DIVIDER
00	1
01	2
10	4
11	8

The lock detect signal is available as one of the selectable outputs through the MUXOUT pin; a logic high indicates that the loop is locked. The MUXOUT pin is controlled by the REF_MUX_SEL bits (Register 0x21, Bits[14:13]); the PLL lock detect signal is the default configuration.

To ensure that the PLL locks to the desired frequency, follow the proper write sequence of the PLL registers. The PLL registers must be configured accordingly to achieve the desired frequency, and the last writes must be to Register 0x02 (INT_DIV in Table 26), Register 0x03 (FRAC_DIV in Table 26), or Register 0x04 (MOD_DIV in Table 26). When one of these registers is programmed, an internal VCO calibration is initiated, which is the last step in locking the PLL.

The time it takes to lock the PLL after the last register is written can be broken down into two parts: VCO band calibration and loop settling.

After the last register is written, the PLL automatically performs a VCO band calibration to choose the correct VCO band. This calibration takes approximately 5120 PFD cycles. For a 40 MHz f_{PFD} , this corresponds to 128 μ s. After calibration is complete, the feedback action of the PLL causes the VCO to lock eventually to the correct frequency. The speed with which this locking occurs depends on the nonlinear cycle slipping behavior, as well as the small signal settling of the loop. For an accurate estimation of the lock time, download the [ADIsimPLL™](#) tool, which correctly captures these effects. In general, higher bandwidth loops tend to lock faster than lower bandwidth loops.

Additional LO Controls

To access the LO signal going to the mixer core through the LOOUT+ and LOOUT– pins (Pin 13 and Pin 14), enable the LO_DRV_EN bit in Register 0x01, Bit 7. This setting offers direct monitoring of the LO signal to the mixer for debug purposes; or the LO signal can be used to daisy-chain many devices synchronously. One [ADRF6614](#) can serve as the master where the LO signal is sourced, and the subsequent slave devices share the same LO signal from the master. This flexibility substantially eases the LO requirements of a system with multiple LOs.

The LO output drive level is controlled by the LO_DRV_LVL bits (Register 0x22, Bits[7:6]). Table 22 shows the available drive levels.

Table 22. LO Drive Levels

LO_DRV_LVL (Register 0x22, Bits[7:6])	Amplitude (dBm)
00	–4
01	0.5
10	3
11	4.5

APPLICATIONS INFORMATION

The ADRF6614 mixer is designed to downconvert radio frequencies (RF) primarily between 700 MHz and 3000 MHz to lower intermediate frequencies (IF) between 40 MHz to 500 MHz. Figure 111 depicts the basic connections of the mixer. It is

recommended to ac couple the RF and LO input ports to prevent nonzero dc voltages from damaging the RF balun or LO input circuit. A RFIN capacitor value of 22 pF is recommended.

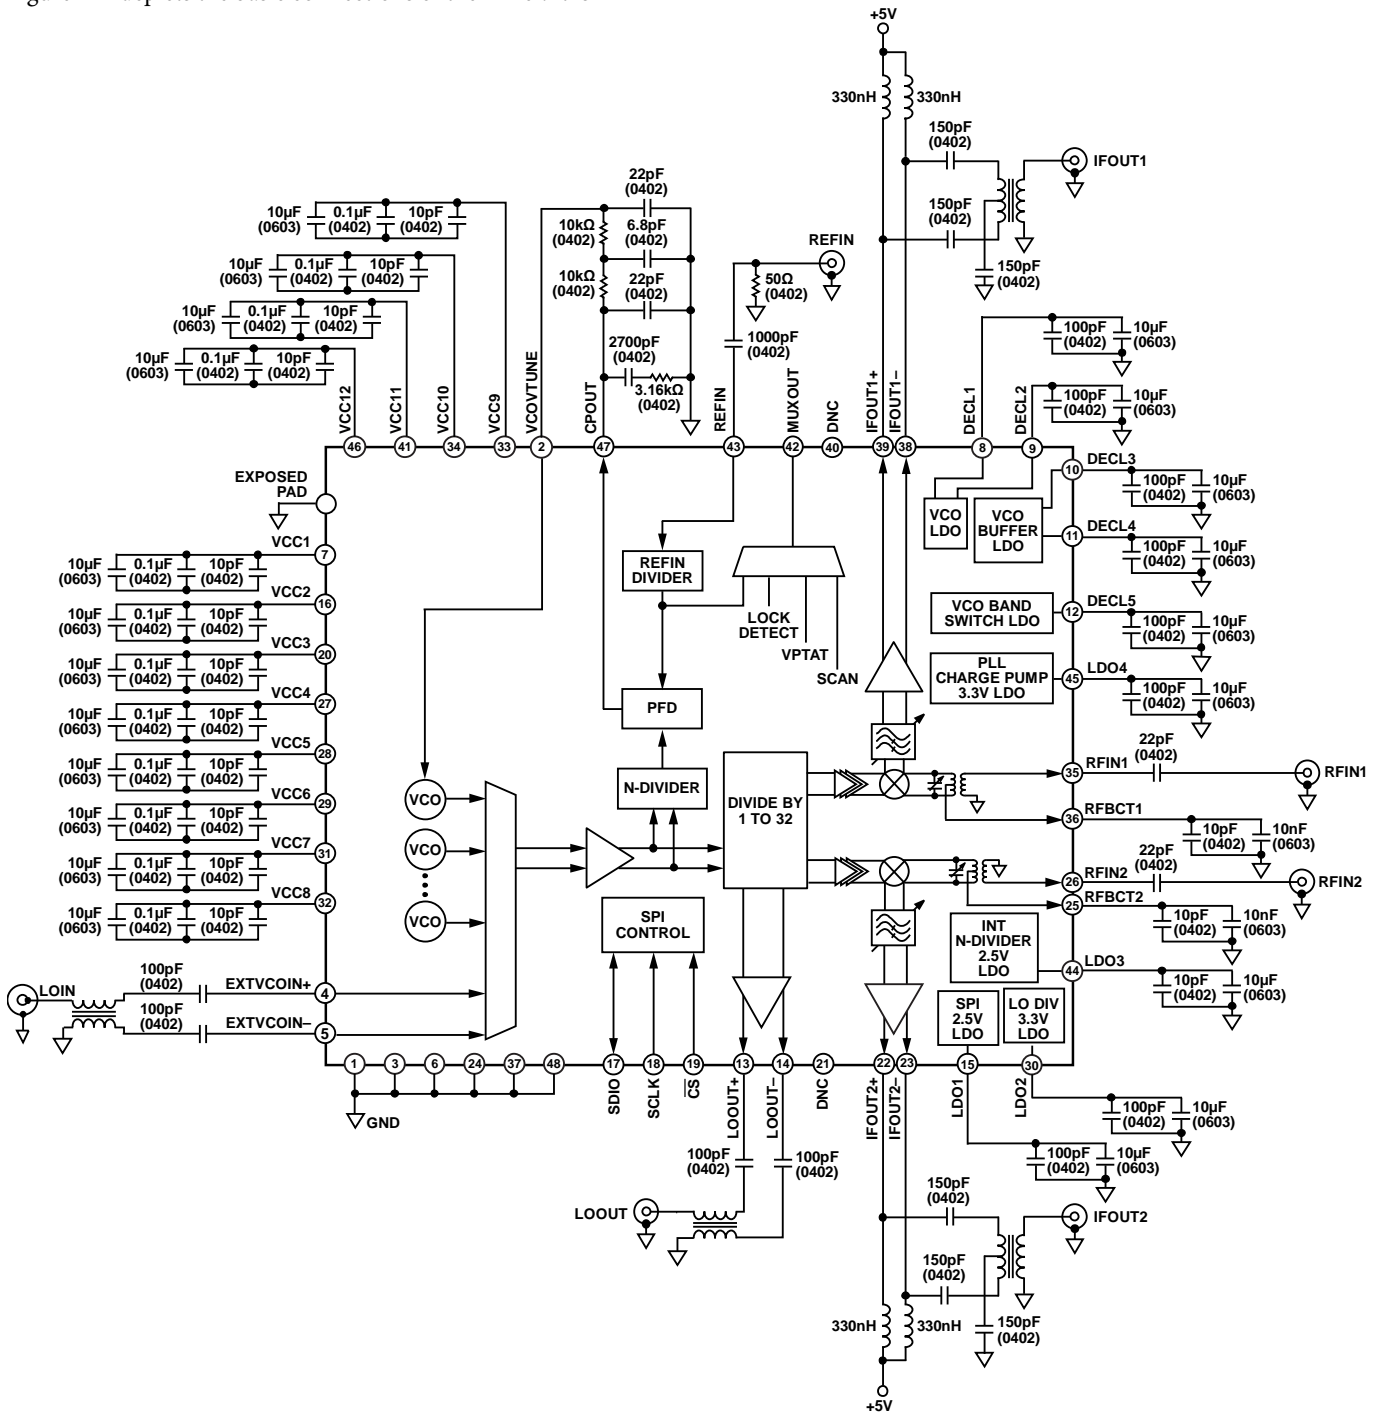

Figure 111. Basic Connections Diagram

BASIC CONNECTIONS BY PIN DESCRIPTION

Table 23. Basic Connections

Pin No.	Mnemonic	Description	Basic Connection
5 V Power			Decouple to GND with a 10 μ F, a 0.1 μ F, and a 10 pF capacitor as close to the pin as possible.
7	VCC1	5 V VCO supply	
16	VCC2	5 V supply for SPI port	
20, 41	VCC3, VCC11	5 V biases for IF Channel 2 and IF Channel 1	
27, 28, 29, 32, 33, 34	VCC4, VCC5, VCC6, VCC8, VCC9, VCC10	5 V supplies for mixer LO amplifier	
31	VCC7	5 V supply for mixer LO divider chain	
46	VCC12	5 V supply for internal PLL	
Internal LDO Nodes			Decouple to GND with a 10 μ F and a 100 pF capacitor, as close to the pin as possible.
8, 9	DECL1, DECL2	VCO LDO outputs	
10, 11, 12	DECL3, DECL4, DECL5	External decoupling for VCO circuitry	
15	LDO1	External decoupling for internal 2.5 V SPI LDO	
30	LDO2	External decoupling for internal 3.3 V PLL/divider LDO	
44	LDO3	External decoupling for internal 2.5 V PLL LDO	
45	LDO4	External decoupling for internal 3.3 V PLL LDO	
GND			Connect directly to the PCB ground through a low impedance connection.
1	GND	External loop filter ground	
3, 6	GND	Common ground for external loop filter	
24, 37	GND	IF stage, Channel 2 and Channel 1 ground	
48	GND	External charge pump ground	
SPI			
17	SDIO	SPI port data input/output	
18	SCLK	SPI port clock	
19	\overline{CS}	SPI port chip select	
RF, Mixer, IF Path			
4, 5	EXTVCOIN+, EXTVCOIN-	External VCO or LO inputs	DC block with 100 pF capacitors.
13, 14	LOOUT+, LOOUT-	Differential LO outputs	DC block with 100 pF capacitors.
22, 23	IFOUT2+, IFOUT2-	Channel 2 differential IF outputs	Bias to 5 V supply with 330 nH inductors and dc block with 150 pF capacitors.
25	RFBCT2	Internal mixer bias control for Channel 2 RF input	Decouple to GND with a 10 pF and a 10 nF capacitor, as close to the pin as possible.
26	RFIN2	Channel 2 single-ended RF input	DC block with a 22 pF capacitor.
36	RFBCT1	Internal mixer bias control for Channel 1 RF input	Decouple to GND with a 10 pF and a 10 nF capacitor, as close to the pin as possible.
35	RFIN1	Channel 1 single-ended RF input	DC block with a 22 pF capacitor.
38, 39	IFOUT1-, IFOUT1+	Channel 1 differential IF outputs	Bias to 5 V supply with 330 nH inductors and dc block with 150 pF capacitors.
PLL/VCO			
2	VCOVTUNE	Control voltage for internal VCO	Output from external loop filter.
43	REFIN	External reference for internal PLL	
47	CPOUT	Charge pump output	Input to external loop filter.
Other			
42	MUXOUT	Output for various internal analog signals, including PLL lock detect and voltage proportional to absolute temperature (VPTAT)	Can be read directly from the pin; the user must be careful of loading effects; not a low impedance output.
21, 40	DNC	Do not connect	

MIXER OPTIMIZATION

RF INPUT BALUN INSERTION LOSS OPTIMIZATION

At lower input frequencies, more capacitance is needed. This increase is achieved by programming higher codes into BAL_COUT. At high frequencies, less capacitance is required; therefore, lower BAL_COUT codes are appropriate.

As shown in Figure 112 and Figure 113, this tuning range can be further optimized by adding capacitance across the RF input in conjunction with tuning BAL_COUT. This added capacitance can help to increase the low frequency range of the device significantly.

Figure 112. Return Loss; Optimum BAL_COUT vs. RF Frequency for Various Tuning Capacitor Values on RFINx Using a High-Side LO

Figure 113. Return Loss; Optimum BAL_COUT vs. RF Frequency for Various Tuning Capacitor Values on RFINx Using a Low-Side LO

IIP3 OPTIMIZATION

In applications in which performance is critical, the ADRF6614 offers IIP3 optimization. The IF amplifier bias current can be reduced to trade performance vs. power consumption. This tradeoff saves on the overall power at the expense of degraded performance.

Figure 114 to Figure 117 show the IIP3 sweeps for all combinations of IFA main bias and linearity bias. The IIP3 vs. main bias and linearity bias figures show both a surface and a contour plot in one

figure. The contour plot is located directly underneath the surface plot. The best approach for reading the figure is to localize the peaks on the surface plot, which indicate maximum IIP3, and to follow the same color pattern to the contour plot to determine the optimized IFA main bias and linearity bias settings.

Figure 114. IIP3 vs. Main Bias (IFA_MAINBIAS) and Linearity Bias (IFA_LINBIAS) Level at IF Frequency = 50 MHz

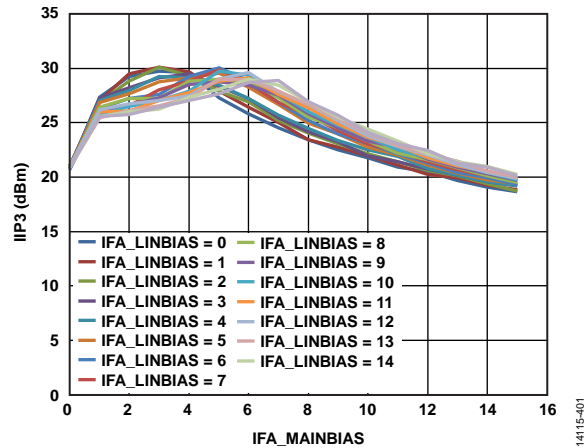

Figure 115. IIP3 vs. Main Bias (IFA_MAINBIAS) and Linearity Bias (IFA_LINBIAS) Level at IF Frequency = 100 MHz

Figure 116. IIP3 vs. Main Bias (IFA_MAINBIAS) and Linearity Bias (IFA_LINBIAS) Level at IF Frequency = 150 MHz

Figure 117. IIP3 vs. Main Bias (IFA_MAINBIAS) and Linearity Bias (IFA_LINBIAS) Level at IF Frequency = 200 MHz

VGS PROGRAMMING

The ADRF6614 allows programmability for internal gate-to-source voltages (VGS) for optimizing mixer performance over the desired frequency bands. The ADRF6614 default VGS setting is 0. Both channels of the ADRF6614 are programmed together using the same VGS setting. Power conversion gain, input IP3, input P1dB, and SSB noise figure can be optimized, as shown in Figure 40, Figure 41, Figure 43, and Figure 44, respectively.

LOW-PASS FILTER PROGRAMMING

The ADRF6614 allows programmability for the low-pass filter terminating the mixer output. This filter blocks sum term mixing products at the expense of some noise figure and gain and can significantly increase input IP3. The ADRF6614 default LPF setting is 0. Both channels of the ADRF6614 are programmed together using the same LPF settings. Power conversion gain, input P1dB, input IP3, and SSB noise figure can be optimized as shown in Figure 42, Figure 45, Figure 46, and Figure 49, respectively.

GSM MODE OF OPERATION

The ADRF6614 supports GSM phase noise specifications in typical GSM bands such as the 800 MHz, 900 MHz, 1800 MHz, and 1900 MHz. GSM phase noise performance in the 800 MHz and 900 MHz bands is met by simply tuning the integrated PLLVCO to the desired frequency.

Integrated VCO cores (VCO_4 and VCO_5) support GSM phase noise performance in the 1800 MHz and 1900 MHz GSM bands. To ensure that GSM phase noise performance is achieved when using the ADRF6614 in 1800 MHz or 1900 MHz bands, select the VCO_4 core by writing the VCO_SEL bits in the VCO_CTRL1 register (Register 0x22, Bits[2:0]) for a frequency range of 1.525 GHz to 1.547 GHz, and the VCO_5 core for a frequency range of 1.668 GHz to 1.708 GHz.

The VCO_4 and VCO_5 cores operate at fundamental frequencies of 3.050 GHz to 3.094 GHz and 3.336 GHz to 3.416 GHz, respectively. To generate the desired LO frequency in the 1800 MHz and 1900 MHz bands, enable divide by 2 by writing to LO_DIV (Register 0x22, Bits[5:3]).

For the GSM mode of operation, the recommended loop filter components and dynamic loop settings are shown in Table 19 at the PFD rate of 1.536 MHz.

See Figure 118 for the GSM mode phase noise performance of -145 dBc/Hz at 800 kHz offset at the carrier frequency of 1.535 GHz.

When using the VCO_4 or VCO_5 cores, it is required to set VTUNE_DAC_SLOPE (Register 0x49, Bits[13:9]) = 9d, VTUNE_DAC_OFFSET (Register 0x49, Bits[8:0]) = 171d, VCO_LDO_R2 (Register 0x22, Bits[11:8]) = 2d, and VCO_LDO_R4 (Register 0x22, Bits[15:12]) = 10d. In transitioning from a GSM VCO (VCO_4 and VCO_5) to an octave VCO, the LDO settings must be changed before changing the VCO selection.

Figure 118. GSM Phase Noise Performance at 1.535 GHz

REGISTER DETAILS

Address: 0x00, Reset: 0x0000, Name: SOFT_RESET

[15:0] SOFT_RESET (R)
SOFT RESET

0: any write to this register will assert soft reset command

Table 27. Bit Descriptions for SOFT_RESET

Bits	Bit Name	Settings	Description	Reset	Access
[15:0]	SOFT_RESET	0	Soft reset bit. Any write to this register asserts a soft reset command.	0x0 0x0	R R

Address: 0x01, Reset: 0x0000, Name: ENABLES

[15] LO_LDO_EN (RW)
Power up LO LDO

[14] LO2_ENP (RW)
LO 2 enable

[13] BALUN_EN (RW)
Input Balun enable

[12] LO1_ENP (RW)
LO 1 enable

[11] DIV2P5_EN (RW)
enable dividers 2.5V LDO

[10:9] PWRUPRX (RW)
Power up Rx
0x0: Power down both mixer channels
0x1: Power up mixer channel 1
0x2: Power up mixer channel 2
0x3: Power up both mixer channels

[8] LO_PATH_EN (RW)
External LO path enable

[0] LDO_3P3_EN (RW)
Power up 3.3V LDO

[1] VCO_LDO_EN (RW)
Power up VCO LDO

[2] CP_EN (RW)
Power up charge pump

[3] DIV_EN (RW)
Power up dividers

[4] VCO_EN (RW)
Power up VCOs

[5] REF_BUF_EN (RW)
Reference buffer enable

[6] VCOBUF_LDO_EN (RW)
VCO buffer LDO enable

[7] LO_DRV_EN (RW)
LO driver enable

Table 28. Bit Descriptions for ENABLES

Bits	Bit Name	Settings	Description	Reset	Access
15	LO_LDO_EN		Power up LO LDO.	0x0	RW
14	LO2_ENP		LO 2 enable.	0x0	RW
13	BALUN_EN		Input balun enable.	0x0	RW
12	LO1_ENP		LO 1 enable.	0x0	RW
11	DIV2P5_EN		Enable dividers 2.5 V LDO.	0x0	RW
[10:9]	PWRUPRX	0x0 0x1 0x2 0x3	Power up Rx. Power down both mixer channels. Power up mixer Channel 1. Power up mixer Channel 2. Power up both mixer channels.	0x0	RW
8	LO_PATH_EN		External LO path enable.	0x0	RW
7	LO_DRV_EN		LO driver enable.	0x0	RW

Bits	Bit Name	Settings	Description	Reset	Access
6	VCOBUF_LDO_EN		VCO buffer LDO enable.	0x0	RW
5	REF_BUF_EN		Reference buffer enable.	0x0	RW
4	VCO_EN		Power up VCOs.	0x0	RW
3	DIV_EN		Power up dividers.	0x0	RW
2	CP_EN		Power up charge pump.	0x0	RW
1	VCO_LDO_EN		Power up VCO LDO.	0x0	RW
0	LDO_3P3_EN		Power up 3.3 V LDO.	0x0	RW

Address: 0x02, Reset: 0x0058, Name: INT_DIV

EVALUATION BOARD

An evaluation board is available for the [ADRF6614](#). The standard evaluation board schematic is presented in Figure 119. The USB interface circuitry schematic is presented in Figure 121 and/or Figure 120. The evaluation board layout is shown in Figure 122

and Figure 123. The evaluation board is fabricated using Rogers® 3003 material. Table 47 details the configuration for the mixer characterization. The evaluation board software is available on www.analog.com.

Figure 119. Evaluation Board, Main Circuitry

ALL 100PF DECouPLING CAPS SHOULD BE AS CLOSE AS POSSIBLE TO THE PINS ON THE CHIP

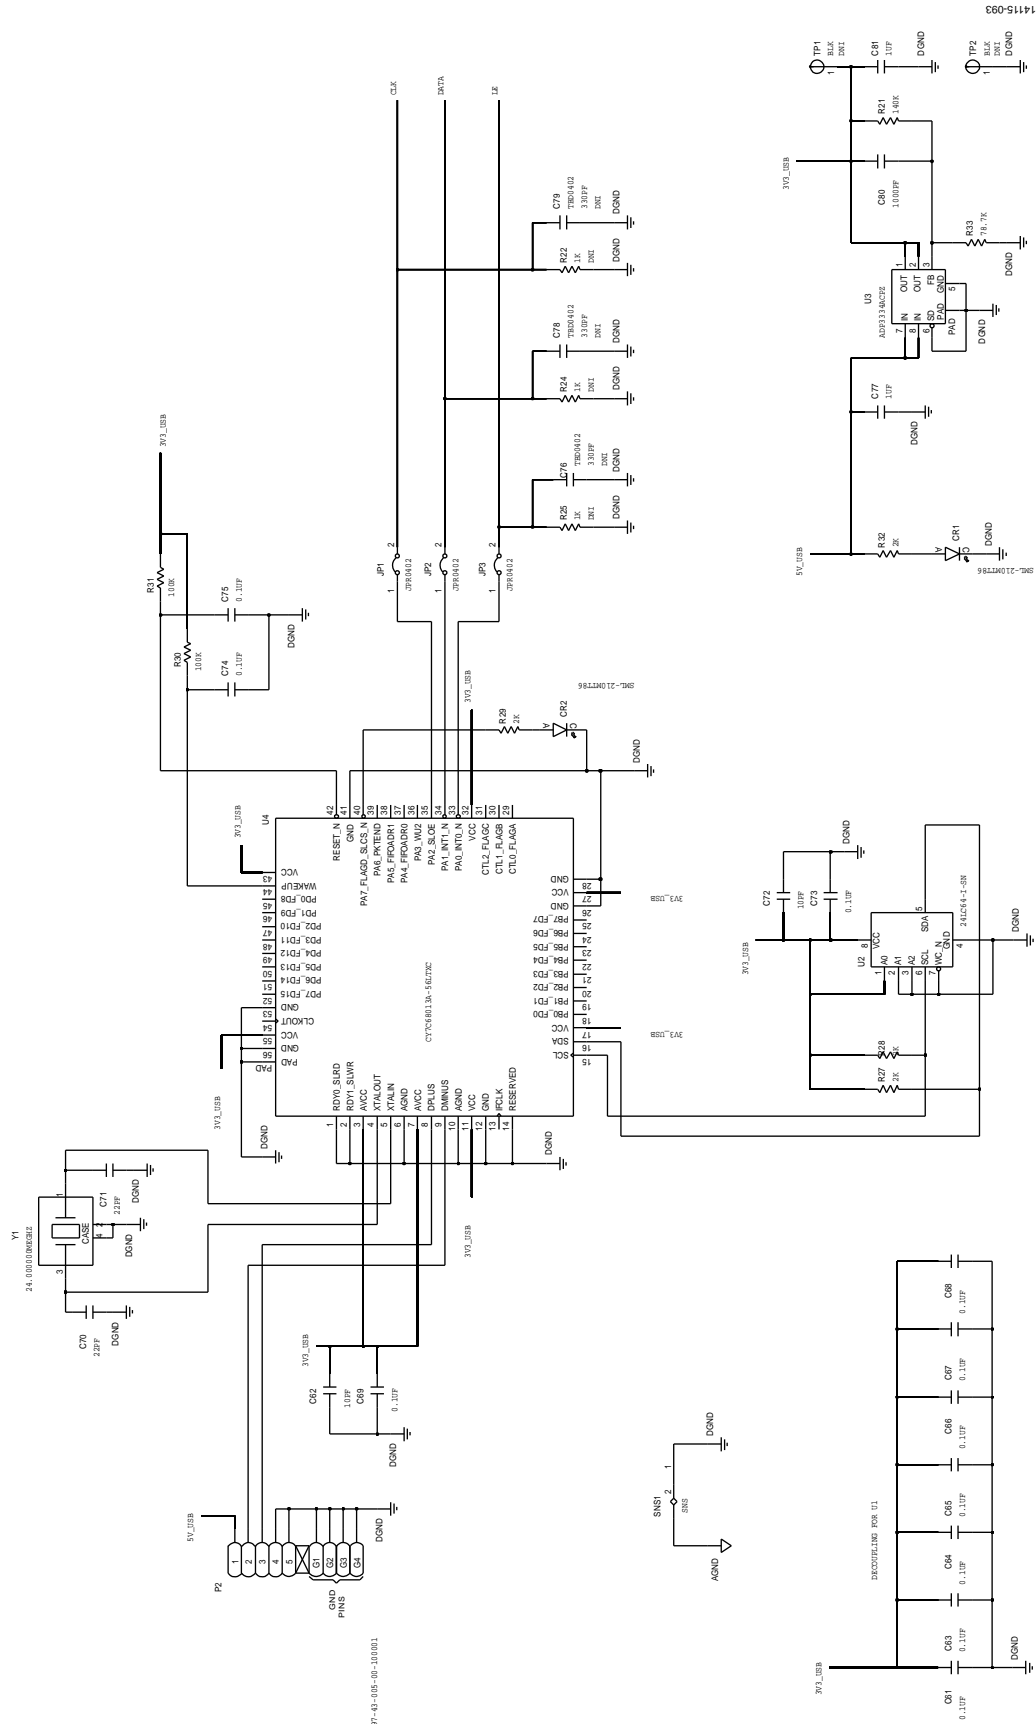

Figure 120. Evaluation Board, Legacy USB Interface

Figure 121. Evaluation Board, Analog Devices, Inc. SDP-5 USB Interface

Table 47. Evaluation Board Bill of Materials

Components	Description	Default Conditions
C1, C2, C8, C11, C12, C13, C14, C15, C18, C19, C20, C23, C26, C27	Power supply decoupling. Nominal supply decoupling consists of a 0.1 μ F capacitor to ground in parallel with a 10 pF capacitor to ground positioned as close to the device as possible.	C1, C2, C26, C27 = 0.1 μ F (size 0402) C8, C11, C12, C13, C14, C15, C18, C19 C20, C23 = 10 pF (size 0402)
C6, C7, C24, C25	RF input interface. The input channels are ac-coupled through C6 and C24. C7 and C25 provide bypassing for the center tap of the RF input baluns.	C6, C24 = 22 pF (size 0402) C7, C25 = 22 pF (size 0402)
C3, C4, C5, C28, C29, C30, L1, L2, L3, L4, R20, R21, R22, R23, T1, T2	IF output interface. The open-collector IF output interfaces are biased through pull-up choke Inductors L1, L2, L3, and L4. T1 and T2 are 4:1 impedance transformers used to provide single-ended IF output interfaces, with C5 and C30 providing center tap bypassing. Remove R21 and R22 for balanced output operation.	C3, C4, C5, C28, C29, C30 = 120 pF (size 0402) L1, L2, L3, L4 = 470 nH (size 0603) R20, R23 = open R21, R22 = 0 Ω (size 0402) T1, T2 = TC4-1W+ (Mini-Circuits®)
C17	LO interface. C17 provides ac coupling for the local oscillator input.	C17 = 22 pF (size 0402)
R1, R2	Bias control. R1 and R2 set the bias point for the internal IF amplifier.	R1, R2 = 910 Ω (size 0402)

ORDERING GUIDE

Model ¹	Temperature Range	Package Description	Package Option
ADRF6614ACPZ-R7	-40°C to +85°C	48-Lead Lead Frame Chip Scale Package [LFCSP]	CP-48-13
ADRF6614-EVALZ		Evaluation Board	

¹ Z = RoHS Compliant Part.

Компания «Life Electronics» занимается поставками электронных компонентов импортного и отечественного производства от производителей и со складов крупных дистрибьюторов Европы, Америки и Азии.

С конца 2013 года компания активно расширяет линейку поставок компонентов по направлению коаксиальный кабель, кварцевые генераторы и конденсаторы (керамические, пленочные, электролитические), за счёт заключения дистрибьюторских договоров

Мы предлагаем:

- Конкурентоспособные цены и скидки постоянным клиентам.
- Специальные условия для постоянных клиентов.
- Подбор аналогов.
- Поставку компонентов в любых объемах, удовлетворяющих вашим потребностям.
- Приемлемые сроки поставки, возможна ускоренная поставка.
- Доставку товара в любую точку России и стран СНГ.
- Комплексную поставку.
- Работу по проектам и поставку образцов.
- Формирование склада под заказчика.
- Сертификаты соответствия на поставляемую продукцию (по желанию клиента).
- Тестирование поставляемой продукции.
- Поставку компонентов, требующих военную и космическую приемку.
- Входной контроль качества.
- Наличие сертификата ISO.

В составе нашей компании организован Конструкторский отдел, призванный помогать разработчикам, и инженерам.

Конструкторский отдел помогает осуществить:

- Регистрацию проекта у производителя компонентов.
- Техническую поддержку проекта.
- Защиту от снятия компонента с производства.
- Оценку стоимости проекта по компонентам.
- Изготовление тестовой платы монтаж и пусконаладочные работы.
