

### FEATURES

- Up to 100 Mbps data rate (NRZ)
- Low propagation delay: 23 ns typical
- Low dynamic power consumption
- Bidirectional communication
- 3.3 V to 5 V level translation
- High temperature operation: 125°C
- High common-mode transient immunity: >25 kV/μs
- Default high output: **ADuM1280/ADuM1281**
- Default low output: **ADuM1285/ADuM1286**
- Narrow body, RoHS-compliant, 8-lead SOIC
- Safety and regulatory approvals**
  - UL recognition: 3000 V rms for 1 minute per UL 1577
  - CSA Component Acceptance Notice 5A
  - VDE Certificate of Conformity
  - DIN V VDE V 0884-10 (VDE V 0884-10): 2006-12
- $V_{IORM} = 560$  V peak
- Qualified for automotive applications

### APPLICATIONS

- General-purpose multichannel isolation
- Data converter isolation
- Industrial field bus isolation
- Hybrid electric vehicles, battery monitor, and motor drive

### GENERAL DESCRIPTION

The **ADuM1280/ADuM1281/ADuM1285/ADuM1286**<sup>1</sup> are dual-channel digital isolators based on the Analog Devices, Inc., iCoupler® technology. Combining high speed CMOS and monolithic air core transformer technology, these isolation components provide outstanding performance characteristics superior to alternatives, such as optocoupler devices and other integrated couplers.

With propagation delay at 23 ns, pulse width distortion is less than 2 ns for C grade. Channel-to-channel matching is tight at 5 ns for C grade. The two channels of the **ADuM1280/ADuM1281/ADuM1285/ADuM1286** are independent isolation channels and are available in two channel configurations with three different data rates up to 100 Mbps (see the Ordering Guide). Industrial grade models operate with the supply voltage on

### FUNCTIONAL BLOCK DIAGRAMS

Figure 1. ADuM1280/ADuM1285

Figure 2. ADuM1281/ADuM1286

either side ranging from 3.135 V to 5.5 V and the automotive grades operate from 3.135 V to 5.5 V, providing compatibility with lower voltage systems as well as enabling a voltage translation functionality across the isolation barrier. Unlike other optocoupler alternatives, the **ADuM1280/ADuM1281/ADuM1285/ADuM1286** isolators have a patented refresh feature that ensures dc correctness in the absence of input logic transitions. When power is first applied or is not yet applied to the input side, the **ADuM1280** and **ADuM1281** have a default high output, and the **ADuM1285** and **ADuM1286** have a default low output.

For more information on safety and regulatory approvals, go to [www.analog.com/icouplersafety](http://www.analog.com/icouplersafety).

<sup>1</sup> Protected by U.S. Patents 5,952,849; 6,873,065; 6,903,578; and 7,075,329. Other patents are pending.

Changes to Features Section, Applications Section, and General Description Section .....	1
Added Table 13 to Table 21; Renumbered Sequentially .....	7
Changes to Table 26 .....	11
Changes to Table 29 and Table 30 .....	13
Changes to Ordering Guide .....	19
Added Automotive Products Section .....	19

### 5/2012—Revision 0: Initial Version

## SPECIFICATIONS

## ELECTRICAL CHARACTERISTICS—5 V OPERATION

All typical specifications are at  $T_A = 25^\circ\text{C}$ ,  $V_{DD1} = V_{DD2} = 5\text{ V}$ . Minimum/maximum specifications apply over the entire recommended operation range:  $4.5\text{ V} \leq V_{DD1} \leq 5.5\text{ V}$ ,  $4.5\text{ V} \leq V_{DD2} \leq 5.5\text{ V}$ ,  $-40^\circ\text{C} \leq T_A \leq 125^\circ\text{C}$ , unless otherwise noted. Switching specifications are tested with  $C_L = 15\text{ pF}$  and CMOS signal levels, unless otherwise noted.

Table 1.

Parameter	Symbol	A, WA Grades			B, WB Grades			C, WC Grades			Unit	Test Conditions
		Min	Typ	Max	Min	Typ	Max	Min	Typ	Max		
SWITCHING SPECIFICATIONS												
Pulse Width	PW	1000			40			10			ns	Within PWD limit
Data Rate			1			25			100		Mbps	Within PWD limit
Propagation Delay	$t_{PHL}$ , $t_{PLH}$			50		35		20	23	29	ns	50% input to 50% output
Pulse Width Distortion	PWD			10		3			2		ns	$ t_{PLH} - t_{PHL} $
Change vs. Temperature			7			3		1.5			ps/ $^\circ\text{C}$	
Propagation Delay Skew	$t_{PSK}$			38		12			9		ns	Between any two units at same operating conditions
Channel Matching <sup>1</sup>												
Codirectional	$t_{PSKCD}$			5		3			2		ns	
Opposing-Direction	$t_{PSKOD}$			10		6			5		ns	
Jitter			2			2			1		ns	

<sup>1</sup> Codirectional channel matching is the absolute value of the difference in propagation delays between any two channels with inputs on the same side of the isolation barrier. Opposing-direction channel matching is the absolute value of the difference in propagation delays between any two channels with inputs on opposing sides of the isolation barrier.

$V_{DDx}$ Hysteresis	$V_{DDXUVH}$		0.1		V	
AC SPECIFICATIONS						
Output Rise/Fall Time	$t_R/t_F$		2.5		ns	10% to 90%
Common-Mode Transient Immunity <sup>1</sup>	$ CM $	25	35		kV/ $\mu$ s	$V_{IX} = V_{DDx}$ , $V_{CM} = 1000$ V, transient magnitude = 800 V
Refresh Period	$t_r$		1.6		$\mu$ s	

<sup>1</sup>  $|CM|$  is the maximum common-mode voltage slew rate that can be sustained while maintaining  $V_o > 0.8 V_{DDx}$ . The common-mode voltage slew rates apply to both rising and falling common-mode voltage edges.

### ELECTRICAL CHARACTERISTICS—3.3 V OPERATION

All typical specifications are at  $T_A = 25^\circ\text{C}$ ,  $V_{DD1} = V_{DD2} = 3.3$  V. Minimum/maximum specifications apply over the entire recommended operation range:  $3.135\text{ V} \leq V_{DD1} \leq 3.6\text{ V}$ ,  $3.135\text{ V} \leq V_{DD2} \leq 3.6\text{ V}$ ,  $-40^\circ\text{C} \leq T_A \leq 125^\circ\text{C}$ , unless otherwise noted. Switching specifications are tested with  $C_L = 15$  pF and CMOS signal levels, unless otherwise noted.

Parameter	Symbol	Min	Typ	Max	Unit	Test Conditions
AC SPECIFICATIONS						
Output Rise/Fall Time	$t_R/t_F$		2.5		ns	10% to 90%
Common-Mode Transient Immunity <sup>1</sup>	CM	25	35		kV/ $\mu$ s	$V_{IX} = V_{DDX}$ , $V_{CM} = 1000$ V, transient magnitude = 800 V
Refresh Period	$t_r$		1.6		$\mu$ s	

<sup>1</sup> |CM| is the maximum common-mode voltage slew rate that can be sustained while maintaining  $V_o > 0.8 V_{DDX}$ . The common-mode voltage slew rates apply to both rising and falling common-mode voltage edges.

## PACKAGE CHARACTERISTICS

Table 13.

Parameter	Symbol	Min	Typ	Max	Unit	Test Conditions/Comments
Resistance (Input-to-Output) <sup>1</sup>	$R_{I-O}$		$10^{13}$		$\Omega$	
Capacitance (Input-to-Output) <sup>1</sup>	$C_{I-O}$		2		pF	$f = 1$ MHz
Input Capacitance <sup>2</sup>	$C_I$		4.0		pF	
IC Junction-to-Ambient Thermal Resistance	$\theta_{JA}$		85		$^{\circ}\text{C}/\text{W}$	Thermocouple located at center of package underside

<sup>1</sup> The device is considered a 2-terminal device; Pin 1 through Pin 4 are shorted together and Pin 5 through Pin 8 are shorted together.

<sup>2</sup> Input capacitance is from any input data pin to ground.

## REGULATORY INFORMATION

The ADuM1280/ADuM1281/ADuM1285/ADuM1286 are approved by the organizations listed in Table 14. See Table 18 and Table 19 for recommended maximum working voltages for specific cross-isolation waveforms and insulation levels.

Table 14.

UL	CSA	VDE
Recognized Under UL 1577 Component Recognition Program <sup>1</sup>	Approved under CSA Component Acceptance Notice 5A	Certified according to DIN V VDE V 0884-10 (VDE V 0884-10): 2006-12 <sup>2</sup>
Single Protection, 3000 V rms Isolation Voltage	Basic insulation per CSA 60950-1-03 and IEC 60950-1, 390 V rms (550 V peak) maximum working voltage	Reinforced insulation, 560 V peak

## ABSOLUTE MAXIMUM RATINGS

$T_A = 25^\circ\text{C}$ , unless otherwise noted.

**Table 18.**

Parameter	Rating
Storage Temperature ( $T_{ST}$ ) Range	$-65^\circ\text{C}$ to $+150^\circ\text{C}$
Ambient Operating Temperature ( $T_A$ ) Range	$-40^\circ\text{C}$ to $+125^\circ\text{C}$
Supply Voltages ( $V_{DD1}$ , $V_{DD2}$ )	$-0.5\text{ V}$ to $+7.0\text{ V}$
Input Voltages ( $V_{IA}$ , $V_{IB}$ )	$-0.5\text{ V}$ to $V_{DD1} + 0.5\text{ V}$
Output Voltages ( $V_{OA}$ , $V_{OB}$ )	$-0.5\text{ V}$ to $V_{DD2} + 0.5\text{ V}$
Average Output Current per Pin <sup>1</sup>	
Side 1 ( $I_{O1}$ )	$-10\text{ mA}$ to $+10\text{ mA}$
Side 2 ( $I_{O2}$ )	$-10\text{ mA}$ to $+10\text{ mA}$
Common-Mode Transients <sup>2</sup>	$-100\text{ kV}/\mu\text{s}$ to $+100\text{ kV}/\mu\text{s}$

<sup>1</sup> See Figure 3 for maximum rated current values for various temperatures.

<sup>2</sup> Refers to common-mode transients across the insulation barrier. Common-mode transients exceeding the absolute maximum ratings may cause latch-up or permanent damage.

Stresses at or above those listed under Absolute Maximum Ratings may cause permanent damage to the product. This is a stress rating only; functional operation of the product at these or any other conditions above those indicated in the operational section of this specification is not implied. Operation beyond the maximum operating conditions for extended periods may affect product reliability.

### ESD CAUTION

**ESD (electrostatic discharge) sensitive device.** Charged devices and circuit boards can discharge without detection. Although this product features patented or proprietary protection circuitry, damage may occur on devices subjected to high energy ESD. Therefore, proper ESD precautions should be taken to avoid performance degradation or loss of functionality.

**Table 19. Maximum Continuous Working Voltage<sup>1</sup>**

Parameter	Max	Unit	Constraint
AC Voltage, Bipolar Waveform	565	V peak	50-year minimum lifetime
AC Voltage, Unipolar Waveform			
Basic Insulation	1131	V peak	Maximum approved working voltage per IEC 60950-1
Reinforced Insulation	560	V peak	Maximum approved working voltage per IEC 60950-1 and VDE V 0884-10
DC Voltage			
Basic Insulation	1131	V peak	Maximum approved working voltage per IEC 60950-1
Reinforced Insulation	560	V peak	Maximum approved working voltage per IEC 60950-1 and VDE V 0884-10

<sup>1</sup> Refers to continuous voltage magnitude imposed across the isolation barrier. See the Insulation Lifetime section for more details.

## PIN CONFIGURATION AND FUNCTION DESCRIPTIONS

## APPLICATIONS INFORMATION

### PRINTED CIRCUIT BOARD LAYOUT

The ADuM1280/ADuM1281/ADuM1285/ADuM1286 digital isolator requires no external interface circuitry for the logic interfaces. Power supply bypassing is strongly recommended at both input and output supply pins  $V_{DD1}$  and  $V_{DD2}$  (see Figure 12). The capacitor value should be between 0.01  $\mu\text{F}$  and 0.1  $\mu\text{F}$ . The total lead length between both ends of the capacitor and the input power supply pin should not exceed 20 mm.

The ADuM1280/ADuM1281/ADuM1285/ADuM1286 can readily meet CISPR 22 Class A (and FCC Class A) emissions standards, as well as the more stringent CISPR 22 Class B (and FCC Class B) standards in an unshielded environment, with proper PCB design choices. Refer to the [AN-1109 Application Note, Recommendations for Control of Radiated Emissions with iCoupler Devices](#) for PCB-related EMI mitigation techniques, including board layout and stack-up issues.

### PROPAGATION DELAY-RELATED PARAMETERS

Propagation delay is a parameter that describes the time it takes a logic signal to propagate through a component. The input-to-output propagation delay time for a high-to-low transition may differ from the propagation delay time of a low-to-high transition.

Figure 12. Propagation Delay Parameters

Pulse width distortion is the maximum difference between these two propagation delay values and an indication of how accurately the timing of the input signal is preserved.

Channel-to-channel matching refers to the maximum amount the propagation delay differs between channels within a single ADuM1280/ADuM1281/ADuM1285/ADuM1286 component.

Propagation delay skew refers to the maximum amount the propagation delay differs between multiple ADuM1280/ADuM1281/ADuM1285/ADuM1286 components operating under the same conditions.

### DC CORRECTNESS AND MAGNETIC FIELD IMMUNITY

Positive and negative logic transitions at the isolator input cause narrow ( $\sim 1$  ns) pulses to be sent via the transformer to the decoder. The decoder is bistable and is, therefore, either set or reset by the pulses indicating input logic transitions. In the absence of logic transitions at the input for more than  $\sim 1.6$   $\mu\text{s}$ , a periodic set of refresh pulses indicative of the correct input state are sent to ensure dc correctness at the output.

If the decoder receives no pulses for more than about 6.4  $\mu\text{s}$ , the input side is assumed to be unpowered or nonfunctional, in which case, the isolator output is forced to a default low state by the watchdog timer circuit.

The limitation on the device's magnetic field immunity is set by the condition in which induced voltage in the transformer receiving coil is sufficiently large to either falsely set or reset the decoder. The following analysis defines such conditions. The ADuM1280 is examined in a 3.3 V operating condition because it represents the most susceptible mode of operation of this product.

The pulses at the transformer output have an amplitude greater than 1.5 V. The decoder has a sensing threshold of about 1.0 V, therefore establishing a 0.5 V margin in which induced voltages can be tolerated. The voltage induced across the receiving coil is given by

$$V = (-d\beta/dt)\sum\pi r_n^2; n = 1, 2, \dots, N$$

where:

$\beta$  is the magnetic flux density.

$r_n$  is the radius of the  $n^{\text{th}}$  turn in the receiving coil.

$N$  is the number of turns in the receiving coil.

Given the geometry of the receiving coil in the ADuM1280 and an imposed requirement that the induced voltage be, at most, 50% of the 0.5 V margin at the decoder, a maximum allowable magnetic field is calculated, as shown in Figure 13.

Figure 13. Maximum Allowable External Magnetic Flux Density

For example, at a magnetic field frequency of 1 MHz, the maximum allowable magnetic field of 0.08 kgauss induces a voltage of 0.25 V at the receiving coil. This is about 50% of the sensing threshold and does not cause a faulty output transition. If such an event occurs, with the worst-case polarity, during a transmitted pulse, it would reduce the received pulse from >1.0 V to 0.75 V. This is still well above the 0.5 V sensing threshold of the decoder.

The preceding magnetic flux density values correspond to specific current magnitudes at given distances away from the ADuM1280 transformers. Figure 14 expresses these allowable current magnitudes as a function of frequency for selected distances. The ADuM1280 is very insensitive to external fields. Only extremely large, high frequency currents, very close to the component could potentially be a concern. For the 1 MHz example noted, place a 0.2 kA current 5 mm away from the ADuM1280 to affect component operation.

Figure 14. Maximum Allowable Current for Various Current to ADuM1280 Spacings

Note that at combinations of strong magnetic field and high frequency, any loops formed by printed circuit board traces could induce sufficiently large error voltages to trigger the thresholds of succeeding circuitry. Take care to avoid PCB structures that form loops.

**POWER CONSUMPTION**

The supply current at a given channel of the ADuM1280/ADuM1281/ADuM1285/ADuM1286 isolator is a function of the supply voltage, the data rate of the channel, and the output load of the channel.

For each input channel, the supply current is given by

$$I_{DDI} = I_{DDI(Q)} \quad f \leq 0.5 f_r$$

$$I_{DDI} = I_{DDI(D)} \times (2f - f_r) + I_{DDI(Q)} \quad f > 0.5 f_r$$

For each output channel, the supply current is given by

$$I_{DDO} = I_{DDO(Q)} \quad f \leq 0.5 f_r$$

$$I_{DDO} = (I_{DDO(D)} + (0.5 \times 10^{-3}) \times C_L \times V_{DDO}) \times (2f - f_r) + I_{DDO(Q)} \quad f > 0.5 f_r$$

where:

$I_{DDI(D)}$ ,  $I_{DDO(D)}$  are the input and output dynamic supply currents per channel (mA/Mbps).

$C_L$  is the output load capacitance (pF).

$V_{DDO}$  is the output supply voltage (V).

$f$  is the input logic signal frequency (MHz); it is half the input data rate, expressed in units of Mbps.

$f_r$  is the input stage refresh rate (Mbps) =  $1/t_r$  ( $\mu$ s).

$I_{DDI(Q)}$ ,  $I_{DDO(Q)}$  are the specified input and output quiescent supply currents (mA).

To calculate the total  $V_{DD1}$  and  $V_{DD2}$  supply current, the supply currents for each input and output channel corresponding to  $V_{DD1}$  and  $V_{DD2}$  are calculated and totaled. Figure 6 and Figure 7 show per-channel supply currents as a function of data rate for an unloaded output condition. Figure 8 shows the per-channel supply current as a function of data rate for a 15 pF output condition. Figure 9 through Figure 11 show the total  $V_{DD1}$  and  $V_{DD2}$  supply current as a function of data rate for ADuM1280/ADuM1281 channel configurations.

## INSULATION LIFETIME

All insulation structures eventually break down when subjected to voltage stress over a sufficiently long period. The rate of insulation degradation is dependent on the characteristics of the voltage waveform applied across the insulation. In addition to the testing performed by the regulatory agencies, Analog Devices carries out an extensive set of evaluations to determine the lifetime of the insulation structure within the [ADuM1280/ADuM1281/ADuM1285/ADuM1286](#).

Analog Devices performs accelerated life testing using voltage levels higher than the rated continuous working voltage. Acceleration factors for several operating conditions are determined. These factors allow calculation of the time to failure at the actual working voltage. The values shown in Table 19 summarize the peak voltage for 50 years of service life for a bipolar ac operating condition and the maximum CSA/VDE approved working voltages. In many cases, the approved working voltage is higher than the 50-year service life voltage. Operation at these high working voltages can lead to shortened insulation life in some cases.

The insulation lifetime of the [ADuM1280/ADuM1281/ADuM1285/ADuM1286](#) depends on the voltage waveform type imposed across the isolation barrier. The *iCoupler* insulation structure degrades at different rates depending on whether the waveform is bipolar ac, unipolar ac, or dc. Figure 15, Figure 16, and Figure 17 illustrate these different isolation voltage waveforms.

Bipolar ac voltage is the most stringent environment. The goal of a 50-year operating lifetime under the ac bipolar condition determines the Analog Devices recommended maximum working voltage.

In the case of unipolar ac or dc voltage, the stress on the insulation is significantly lower. This allows operation at higher working voltages while still achieving a 50-year service life. The working voltages listed in Table 19 can be applied while maintaining the 50-year minimum lifetime provided the voltage conforms to either the unipolar ac or dc voltage case. Any cross-insulation voltage waveform that does not conform to Figure 16 or Figure 17 should be treated as a bipolar ac waveform, and its peak voltage should be limited to the 50-year lifetime voltage value listed in Table 19.

Note that the voltage presented in Figure 17 is shown as sinusoidal for illustration purposes only. It is meant to represent any voltage waveform varying between 0 V and some limiting value. The limiting value can be positive or negative, but the voltage cannot cross 0 V.

<sup>1</sup> Z = RoHS Compliant Part.

<sup>2</sup> Tape and reel are available. The addition of an "-RL7" suffix designates a 7" (1,000 units) tape and reel option.

<sup>3</sup> W = Qualified for Automotive Applications.

**AUTOMOTIVE PRODUCTS**

The [ADuM1280W](#), [ADuM1281W](#), [ADuM1285W](#), and [ADuM1286W](#) models are available with controlled manufacturing to support the quality and reliability requirements of automotive applications. Note that these automotive models may have specifications that differ from the commercial models; therefore, designers should review the Specifications section of this data sheet carefully. Only the automotive grade products shown are available for use in automotive applications. Contact your local Analog Devices account representative for specific product ordering information and to obtain the specific Automotive Reliability reports for these models.

Компания «Life Electronics» занимается поставками электронных компонентов импортного и отечественного производства от производителей и со складов крупных дистрибьюторов Европы, Америки и Азии.

С конца 2013 года компания активно расширяет линейку поставок компонентов по направлению коаксиальный кабель, кварцевые генераторы и конденсаторы (керамические, пленочные, электролитические), за счёт заключения дистрибьюторских договоров

Мы предлагаем:

- Конкурентоспособные цены и скидки постоянным клиентам.
- Специальные условия для постоянных клиентов.
- Подбор аналогов.
- Поставку компонентов в любых объемах, удовлетворяющих вашим потребностям.
- Приемлемые сроки поставки, возможна ускоренная поставка.
- Доставку товара в любую точку России и стран СНГ.
- Комплексную поставку.
- Работу по проектам и поставку образцов.
- Формирование склада под заказчика.
- Сертификаты соответствия на поставляемую продукцию (по желанию клиента).
- Тестирование поставляемой продукции.
- Поставку компонентов, требующих военную и космическую приемку.
- Входной контроль качества.
- Наличие сертификата ISO.

В составе нашей компании организован Конструкторский отдел, призванный помогать разработчикам, и инженерам.

Конструкторский отдел помогает осуществить:

- Регистрацию проекта у производителя компонентов.
- Техническую поддержку проекта.
- Защиту от снятия компонента с производства.
- Оценку стоимости проекта по компонентам.
- Изготовление тестовой платы монтаж и пусконаладочные работы.
