

## MEMS motion sensor: low-power high-g 3-axis digital accelerometer

Datasheet - production data

### Description

The H3LIS200DL is a low-power high-performance 3-axis linear accelerometer belonging to the “nano” family, with digital I<sup>2</sup>C/SPI serial interface standard output.

The device features ultra-low-power operational modes that allow advanced power saving and smart sleep-to-wakeup functions.

The H3LIS200DL has dynamically user-selectable full scales of  $\pm 100g/\pm 200g$  and is capable of measuring accelerations with output data rates from 0.5 Hz to 1 kHz.

The H3LIS200DL is available in a small thin plastic land grid array package (LGA) and is guaranteed to operate over an extended temperature range from  $-40\text{ }^{\circ}\text{C}$  to  $+85\text{ }^{\circ}\text{C}$ .

### Features

- Wide supply voltage, 2.16 V to 3.6 V
- Low-voltage compatible IOs, 1.8 V
- Ultra-low power consumption down to 10  $\mu\text{A}$  in low-power mode
- $\pm 100g/\pm 200g$  dynamically selectable full scales
- I<sup>2</sup>C/SPI digital output interface
- 8-bit data output
- Sleep-to-wakeup function
- 10000 g high shock survivability
- ECOPACK<sup>®</sup>, RoHS and “Green” compliant

### Applications

- Shock detection
- Impact recognition and logging

Table 1. Device summary

Order codes	Temperature range [ $^{\circ}\text{C}$ ]	Package	Packaging
H3LIS200DLTR	-40 to +85	TFLGA 3x3x1.0 mm <sup>3</sup> 16L	Tape and reel

## 2 Mechanical and electrical specifications

### 2.1 Mechanical characteristics

@ Vdd = 2.5 V, T = 25 °C unless otherwise noted <sup>(a)</sup>.

**Table 3. Mechanical characteristics**

Symbol	Parameter	Test conditions	Min.	Typ. <sup>(1)</sup>	Max.	Unit
FS	Measurement range <sup>(2)</sup>	FS bit set to 0		±100		g
		FS bit set to 1		±200		
So	Sensitivity <sup>(3)</sup>	FS bit set to 0		780		mg/digit
		FS bit set to 1		1560		
TCSO	Sensitivity change vs. temperature	FS bit set to 0		±0.01		%/°C
TyOff	Typical zero-g level offset accuracy <sup>(4)</sup>	FS bit set to 0		±1.5		g
TCOff	Zero-g level change vs. temperature	Max. delta from 25 °C		±5		mg/°C
An	Acceleration noise density	FS bit set to 0 - ODR 50Hz		50		mg/√Hz
NL	Non-linearity	FS bit set to 0 Range -70g .. +70g		3		%FS
Top	Operating temperature range		-40		+85	°C
Wh	Product weight			20		mgram

1. Typical specifications are not guaranteed.
2. Verified by wafer level test and measurement of initial offset and sensitivity.
3. Factory calibrated at ±1 g
4. Offset can be eliminated by enabling the built-in high-pass filter.

a. The product is factory calibrated at 2.5 V. The operational power supply range is from 2.16 V to 3.6 V. The product calibration is done at ±1 g.

## 2.2 Electrical characteristics

@ Vdd = 2.5 V, T = 25 °C unless otherwise noted <sup>(b)</sup>.

**Table 4. Electrical characteristics**

Symbol	Parameter	Test conditions	Min.	Typ. <sup>(1)</sup>	Max.	Unit
Vdd	Supply voltage		2.16	2.5	3.6	V
Vdd_IO	I/O pins supply voltage <sup>(2)</sup>		1.71		Vdd+0.1	V
Idd	Current consumption in normal mode			300		µA
IddLP	Current consumption in low-power mode			10		µA
IddPdn	Current consumption in power-down mode			1		µA
VIH	Digital high-level input voltage		0.8*Vdd_IO			V
VIL	Digital low-level input voltage				0.2*Vdd_IO	V
VOH	High-level output voltage		0.9*Vdd_IO			V
VOL	Low-level output voltage				0.1*Vdd_IO	V
ODR	Output data rate in normal mode	DR bit set to 00		50		Hz
		DR bit set to 01		100		
		DR bit set to 10		400		
		DR bit set to 11		1000		
ODR <sub>LP</sub>	Output data rate in low-power mode	PM bit set to 010		0.5		Hz
		PM bit set to 011		1		
		PM bit set to 100		2		
		PM bit set to 101		5		
		PM bit set to 110		10		
BW	System bandwidth <sup>(3)</sup>			ODR/2		Hz
Ton	Turn-on time <sup>(4)</sup>	ODR = 100 Hz		1/ODR+1 ms		s
Top	Operating temperature range		-40		+85	°C

1. Typical specifications are not guaranteed.
2. It is possible to remove Vdd maintaining Vdd\_IO without blocking the communication busses; in this condition the measurement chain is powered off.
3. Refer to [Table 20](#) for filter cutoff frequency.
4. Time to obtain valid data after exiting power-down mode.

b. The product is factory calibrated at 2.5 V. The operational power supply range is from 2.16 V to 3.6 V.

## 2.3 Communication interface characteristics

### 2.3.1 SPI - serial peripheral interface

Subject to general operating conditions for Vdd and Top.

Table 5. SPI slave timing values

Symbol	Parameter	Value <sup>(1)</sup>		Unit
		Min.	Max.	
$t_{c(SPC)}$	SPI clock cycle	100		ns
$f_{c(SPC)}$	SPI clock frequency		10	MHz
$t_{su(CS)}$	CS setup time	6		ns
$t_{h(CS)}$	CS hold time	8		
$t_{su(SI)}$	SDI input setup time	5		
$t_{h(SI)}$	SDI input hold time	15		
$t_{v(SO)}$	SDO valid output time		50	
$t_{h(SO)}$	SDO output hold time	9		
$t_{dis(SO)}$	SDO output disable time		50	

1. Values are guaranteed at 10 MHz clock frequency for SPI with both 4 and 3 wires, based on characterization results, not tested in production.

Figure 3. SPI slave timing diagram <sup>(2)</sup>

2. Measurement points are done at 0.2·Vdd\_IO and 0.8·Vdd\_IO, for both input and output ports.

3. When no communication is ongoing, data on CS, SPC, SDI and SDO are driven by internal pull-up resistors.

### 2.3.2 I<sup>2</sup>C - inter-IC control interface

Subject to general operating conditions for Vdd and Top.

Table 6. I<sup>2</sup>C slave timing values

Symbol	Parameter	I <sup>2</sup> C standard mode <sup>(1)</sup>		I <sup>2</sup> C fast mode <sup>(1)</sup>		Unit
		Min.	Max.	Min.	Max.	
f <sub>(SCL)</sub>	SCL clock frequency	0	100	0	400	KHz
t <sub>w(SCLL)</sub>	SCL clock low time	4.7		1.3		μs
t <sub>w(SCLH)</sub>	SCL clock high time	4.0		0.6		
t <sub>su(SDA)</sub>	SDA setup time	250		100		ns
t <sub>h(SDA)</sub>	SDA data hold time	0.01	3.45	0.01	0.9	μs
t <sub>r(SDA)</sub> t <sub>r(SCL)</sub>	SDA and SCL rise time		1000	20 + 0.1C <sub>b</sub> <sup>(2)</sup>	300	ns
t <sub>f(SDA)</sub> t <sub>f(SCL)</sub>	SDA and SCL fall time		300	20 + 0.1C <sub>b</sub> <sup>(2)</sup>	300	
t <sub>h(ST)</sub>	START condition hold time	4		0.6		μs
t <sub>su(SR)</sub>	Repeated START condition setup time	4.7		0.6		
t <sub>su(SP)</sub>	STOP condition setup time	4		0.6		
t <sub>w(SP:SR)</sub>	Bus free time between STOP and START condition	4.7		1.3		

1. Data based on standard I<sup>2</sup>C protocol requirement, not tested in production.
2. C<sub>b</sub> = total capacitance of one bus line, in pF.

Figure 4. I<sup>2</sup>C slave timing diagram

Note: Measurement points are done at 0.2·Vdd<sub>IO</sub> and 0.8·Vdd<sub>IO</sub>, for both ports.

## 2.4 Absolute maximum ratings

Stresses above those listed as “absolute maximum ratings” may cause permanent damage to the device. This is a stress rating only and functional operation of the device under these conditions is not implied. Exposure to maximum rating conditions for extended periods may affect device reliability.

**Table 7. Absolute maximum ratings**

Symbol	Ratings	Maximum value	Unit
V <sub>dd</sub>	Supply voltage	-0.3 to 4.8	V
V <sub>dd_IO</sub>	I/O pins supply voltage	-0.3 to 4.8	V
V <sub>in</sub>	Input voltage on any control pin (CS, SCL/SPC, SDA/SDI/SDO, SDO/SA0)	-0.3 to V <sub>dd_IO</sub> +0.3	V
A <sub>POW</sub>	Acceleration (any axis, powered, V <sub>dd</sub> = 2.5 V)	3000 g for 0.5 ms	
		10000 g for 0.1 ms	
A <sub>UNP</sub>	Acceleration (any axis, unpowered)	3000 g for 0.5 ms	
		10000 g for 0.1 ms	
T <sub>OP</sub>	Operating temperature range	-40 to +85	°C
T <sub>STG</sub>	Storage temperature range	-40 to +125	°C
ESD	Electrostatic discharge protection	4 (HBM)	kV
		1.5 (CDM)	kV
		200 (MM)	V

*Note:* Supply voltage on any pin should never exceed 4.8 V.

This device is sensitive to mechanical shock, improper handling can cause permanent damage to the part.

This is an electrostatic-sensitive device (ESD), improper handling can cause permanent damage to the part.

## 2.5 Terminology

### 2.5.1 Sensitivity

Sensitivity describes the gain of the sensor and can be determined by applying 1 g acceleration to it. As the sensor can measure DC accelerations this can be done easily by pointing the axis of interest towards the center of the Earth, noting the output value, rotating the sensor by 180 degrees (pointing to the sky) and noting the output value again. By doing so,  $\pm 1$  g acceleration is applied to the sensor. Subtracting the larger output value from the smaller one, and dividing the result by 2, leads to the actual sensitivity of the sensor. This value changes very little over temperature and time. The sensitivity tolerance describes the range of sensitivities of a large population of sensors.

### 2.5.2 Zero-g level

The zero-g level offset (TyOff) describes the deviation of an actual output signal from the ideal output signal if no acceleration is present. A sensor in a steady-state on a horizontal surface measures 0 g for the X-axis and 0 g for the Y-axis whereas the Z-axis measures 1 g. The output is ideally in the middle of the dynamic range of the sensor (content of OUT registers 00h, data expressed as two's complement number). A deviation from the ideal value in this case is called zero-g offset. Offset is, to some extent, a result of stress to the MEMS sensor and therefore can slightly change after mounting the sensor onto a printed circuit board or exposing it to extensive mechanical stress. Offset changes little over temperature, refer to "Zero-g level change vs. temperature" (see TCOff in [Table 3](#)). The zero-g level tolerance (TyOff) describes the standard deviation of the range of zero-g levels of a population of sensors.

### 2.5.3 Sleep-to-wakeup

The "sleep-to-wakeup" function, in conjunction with low-power mode, allows further reducing the system power consumption and develop new smart applications.

The H3LIS200DL may be set in a low-power operating mode, characterized by lower data rate refreshes. In this way the device, even if sleeping, continues to sense acceleration and generate interrupt requests.

When the "sleep-to-wakeup" function is activated, the H3LIS200DL is able to automatically wake up as soon as the interrupt event has been detected, increasing the output data rate and bandwidth.

With this feature the system may be efficiently switched from low-power mode to full performance, depending on user-selectable positioning and acceleration events, therefore ensuring power saving and flexibility.

## 3 Functionality

The H3LIS200DL is a “nano”, low-power, digital output 3-axis linear accelerometer housed in an LGA package. The complete device includes a sensing element and an IC interface able to take the information from the sensing element and to provide a signal to the external world through an I<sup>2</sup>C/SPI serial interface.

### 3.1 Sensing element

A proprietary process is used to create a surface micromachined accelerometer. The technology allows processing suspended silicon structures, which are attached to the substrate in a few points called anchors and are free to move in the direction of the sensed acceleration. To be compatible with traditional packaging techniques, a cap is placed on top of the sensing element to avoid blocking the moving parts during the molding phase of the plastic encapsulation.

When an acceleration is applied to the sensor, the proof mass displaces from its nominal position, causing an imbalance in the capacitive half bridge. This imbalance is measured using charge integration in response to a voltage pulse applied to the capacitor.

At steady-state the nominal value of the capacitors are a few pF and when an acceleration is applied, the maximum variation of the capacitive load is in the fF range.

### 3.2 IC interface

The complete measurement chain is composed of a low-noise capacitive amplifier which converts the capacitive unbalancing of the MEMS sensor into an analog voltage that will be available to the user through an analog-to-digital converter.

The acceleration data may be accessed through an I<sup>2</sup>C/SPI interface, making the device particularly suitable for direct interfacing with a microcontroller.

The H3LIS200DL features a data-ready signal (RDY) which indicates when a new set of measured acceleration data is available, therefore simplifying data synchronization in the digital system that uses the device.

### 3.3 Factory calibration

The IC interface is factory calibrated for sensitivity ( $S_0$ ) and zero-g level ( $TyOff$ ).

The trim values are stored inside the device in non-volatile memory. Any time the device is turned on, the trim parameters are downloaded into the registers to be used during active operation. This allows the device to be used without further calibration.

## 4 Application hints

Figure 5. H3LIS200DL electrical connections

The device core is supplied through the Vdd line while the I/O pads are supplied through the Vdd\_IO line. Power supply decoupling capacitors (100 nF ceramic, 10 µF aluminum) should be placed as near as possible to pin 14 of the device (common design practice).

All the voltage and ground supplies must be present at the same time to have proper behavior of the IC (refer to *Figure 5*). It is possible to remove Vdd maintaining Vdd\_IO without blocking the communication bus, in this condition the measurement chain is powered off.

The functionality of the device and the measured acceleration data are selectable and accessible through the I<sup>2</sup>C or SPI interfaces. When using the I<sup>2</sup>C, CS must be tied high.

The functions, the threshold and the timing of the two interrupt pins (INT 1 and INT 2) can be completely programmed by the user through the I<sup>2</sup>C/SPI interface.

### 4.1 Soldering information

The LGA package is compliant with the ECOPACK<sup>®</sup>, RoHS and “Green” standards. It is qualified for soldering heat resistance according to JEDEC J-STD-020C.

Leave “pin 1 indicator” unconnected during soldering.

Land pattern and soldering recommendations are available at [www.st.com](http://www.st.com).

## 5 Digital interfaces

The registers embedded inside the H3LIS200DL may be accessed through both the I<sup>2</sup>C and SPI serial interfaces. The latter may be SW configured to operate either in 3-wire or 4-wire interface mode.

The serial interfaces are mapped onto the same pads. To select/exploit the I<sup>2</sup>C interface, the CS line must be tied high (i.e. connected to Vdd\_IO).

**Table 8. Serial interface pin description**

Pin name	Pin description
CS	SPI enable I <sup>2</sup> C/SPI mode selection (1: I <sup>2</sup> C mode; 0: SPI enabled)
SCL	I <sup>2</sup> C serial clock (SCL)
SPC	SPI serial port clock (SPC)
SDA	I <sup>2</sup> C serial data (SDA)
SDI	SPI serial data input (SDI)
SDO	3-wire interface serial data output (SDO)
SA0	I <sup>2</sup> C less significant bit of the device address (SA0)
SDO	SPI serial data output (SDO)

### 5.1 I<sup>2</sup>C serial interface

The H3LIS200DL I<sup>2</sup>C is a bus slave. The I<sup>2</sup>C is employed to write data into registers whose content can also be read back.

The relevant I<sup>2</sup>C terminology is given in the table below.

**Table 9. I<sup>2</sup>C terminology**

Term	Description
Transmitter	The device which sends data to the bus
Receiver	The device which receives data from the bus
Master	The device which initiates a transfer, generates clock signals and terminates a transfer
Slave	The device addressed by the master

There are two signals associated with the I<sup>2</sup>C bus: the serial clock line (SCL) and the serial data line (SDA). The latter is a bi-directional line used for sending and receiving the data to/from the interface. Both the lines are connected to Vdd\_IO through a pull-up resistor embedded inside the H3LIS200DL. When the bus is free both lines are high.

The I<sup>2</sup>C interface is compliant with fast mode (400 kHz) I<sup>2</sup>C standards as well as with normal mode.

### 5.1.1 I<sup>2</sup>C operation

The transaction on the bus is started through a START (ST) signal. A START condition is defined as a high-to-low transition on the data line while the SCL line is held high. After this has been transmitted by the master, the bus is considered busy. The next byte of data transmitted after the START condition contains the address of the slave in the first 7 bits and the eighth bit tells whether the master is receiving data from the slave or transmitting data to the slave. When an address is sent, each device in the system compares the first seven bits after a START condition with its address. If they match, the device considers itself addressed by the master.

The slave address (SAD) associated to the H3LIS200DL is 001100xb. The **SDO/SA0** pad can be used to modify the less significant bit of the device address. If the SA0 pad is connected to the voltage supply, LSB is '1' (address 0011001b) or else, if the SA0 pad is connected to ground, the LSB value is '0' (address 0011000b). This solution allows the connection and addressing of two different accelerometers to the same I<sup>2</sup>C lines.

Data transfer with acknowledge is mandatory. The transmitter must release the SDA line during the acknowledge pulse. The receiver must then pull the data line low so that it remains stable low during the high period of the acknowledge clock pulse. A receiver which has been addressed is obliged to generate an acknowledge after each byte of data received.

The I<sup>2</sup>C embedded inside the H3LIS200DL behaves like a slave device and the following protocol must be adhered to. After the START condition (ST) a slave address is sent, once a slave acknowledge (SAK) has been returned, an 8-bit sub-address (SUB) is transmitted: the 7 LSB represent the actual register address while the MSB enables address auto increment. If the MSB of the SUB field is '1', the SUB (register address) is automatically increased to allow multiple data read/write.

The slave address is completed with a Read/Write bit. If the bit is '1' (read), a repeated START (SR) condition must be issued after the two sub-address bytes; if the bit is '0' (write), the master transmits to the slave with the direction unchanged. [Table 10](#) explains how the SAD+Read/Write bit pattern is composed, listing all the possible configurations.

**Table 10. SAD+Read/Write patterns**

Command	SAD[6:1]	SAD[0] = SA0	R/W	SAD+R/W
Read	001100	0	1	00110001 (31h)
Write	001100	0	0	00110000 (30h)
Read	001100	1	1	00110011 (33h)
Write	001100	1	0	00110010 (32h)

**Table 11. Transfer when master is writing one byte to slave**

Master	ST	SAD + W		SUB		DATA		SP
Slave			SAK		SAK		SAK	

**Table 12. Transfer when master is writing multiple bytes to slave**

Master	ST	SAD + W		SUB		DATA		DATA		SP
Slave			SAK		SAK		SAK		SAK	

**Table 13. Transfer when master is receiving (reading) one byte of data from slave**

Master	ST	SAD + W		SUB		SR	SAD + R			NMAK	SP
Slave			SAK		SAK			SAK	DATA		

**Table 14. Transfer when master is receiving (reading) multiple bytes of data from slave**

Master	ST	SAD+W		SUB		SR	SAD+R			MAK		MAK		NMAK	SP
Slave			SAK		SAK			SAK	DATA		DAT A		DAT A		

Data are transmitted in byte format (DATA). Each data transfer contains 8 bits. The number of bytes transferred per transfer is unlimited. Data is transferred with the most significant bit (MSB) first. If a receiver can't receive another complete byte of data until it has performed some other function, it can hold the clock line SCL low to force the transmitter into a wait state. Data transfer only continues when the receiver is ready for another byte and releases the data line. If a slave receiver doesn't acknowledge the slave address (i.e. it is not able to receive because it is performing some real-time function) the data line must be left high by the slave. The master can then abort the transfer. A low-to-high transition on the SDA line while the SCL line is high is defined as a STOP condition. Each data transfer must be terminated by the generation of a STOP (SP) condition.

In order to read multiple bytes, it is necessary to assert the most significant bit of the sub-address field. In other words, SUB(7) must be equal to 1 while SUB(6-0) represents the address of first register to be read.

In the presented communication format MAK is master acknowledge and NMAK is no master acknowledge.

## 5.2 SPI bus interface

The H3LIS200DL SPI is a bus slave. The SPI allows the writing and reading of the device registers.

The serial interface interacts with the outside world with 4 wires: **CS**, **SPC**, **SDI** and **SDO**.

Figure 6. Read and write protocol

**CS** is the serial port enable and it is controlled by the SPI master. It goes low at the start of the transmission and goes back high at the end. **SPC** is the serial port clock and it is controlled by the SPI master. It is stopped high when **CS** is high (no transmission). **SDI** and **SDO** are respectively the serial port data input and output. Those lines are driven at the falling edge of **SPC** and should be captured at the rising edge of **SPC**.

Both the read register and write register commands are completed in 16 clock pulses or in multiples of 8 in the case of multiple read/write bytes. Bit duration is the time between two falling edges of **SPC**. The first bit (bit 0) starts at the first falling edge of **SPC** after the falling edge of **CS** while the last bit (bit 15, bit 23, ...) starts at the last falling edge of **SPC** just before the rising edge of **CS**.

**bit 0:**  $\overline{RW}$  bit. When 0, the data DI(7:0) is written into the device. When 1, the data DO(7:0) from the device is read. In the latter case, the chip drives **SDO** at the start of bit 8.

**bit 1:**  $\overline{MS}$  bit. When 0, the address remains unchanged in multiple read/write commands. When 1, the address is auto-incremented in multiple read/write commands.

**bit 2-7:** address AD(5:0). This is the address field of the indexed register.

**bit 8-15:** data DI(7:0) (write mode). This is the data that is written into the device (MSB first).

**bit 8-15:** data DO(7:0) (read mode). This is the data that is read from the device (MSB first).

In multiple read/write commands further blocks of 8 clock periods are added. When the  $\overline{MS}$  bit is '0', the address used to read/write data remains the same for every block. When the  $\overline{MS}$  bit is '1' the address used to read/write data is increased at every block.

The function and the behavior of **SDI** and **SDO** remain unchanged.

5.2.1 SPI read

Figure 7. SPI read protocol

The SPI read command is performed with 16 clock pulses. A multiple byte read command is performed by adding blocks of 8 clock pulses to the previous one.

**bit 0:** READ bit. The value is 1.

**bit 1:**  $\overline{MS}$  bit. When 0, does not increment the address. When 1, increments the address in multiple reads.

**bit 2-7:** address AD(5:0). This is the address field of the indexed register.

**bit 8-15:** data DO(7:0) (read mode). This is the data that is read from the device (MSB first).

**bit 16-...** : data DO(...-8). Further data in multiple byte reads.

Figure 8. Multiple byte SPI read protocol (2-byte example)

### 5.2.2 SPI write

Figure 9. SPI write protocol

The SPI write command is performed with 16 clock pulses. A multiple byte write command is performed by adding blocks of 8 clock pulses to the previous one.

**bit 0:** WRITE bit. The value is 0.

**bit 1:**  $\overline{MS}$  bit. When 0, does not increment the address. When 1, increments the address in multiple writes.

**bit 2 -7:** address AD(5:0). This is the address field of the indexed register.

**bit 8-15:** data DI(7:0) (write mode). This is the data that is written inside the device (MSB first).

**bit 16-...:** data DI(...-8). Further data in multiple byte writes.

Figure 10. Multiple byte SPI write protocol (2-byte example)

### 5.2.3 SPI read in 3-wire mode

3-wire mode is entered by setting bit SIM (SPI serial interface mode selection) to '1' in CTRL\_REG4.

**Figure 11. SPI read protocol in 3-wire mode**

The SPI read command is performed with 16 clock pulses:

**bit 0:** READ bit. The value is 1.

**bit 1:**  $\overline{MS}$  bit. When 0, does not increment the address. When 1, increments the address in multiple reads.

**bit 2-7:** address AD(5:0). This is the address field of the indexed register.

**bit 8-15:** data DO(7:0) (read mode). This is the data that is read from the device (MSB first).

The multiple read command is also available in 3-wire mode.

## 6 Register mapping

*Table 15* provides a list of the 8-bit registers embedded in the device and the corresponding addresses.

**Table 15. Register address map**

Name	Type	Register address		Default	Comment
		Hex	Binary		
Reserved (do not modify)		00 - 0E			Reserved
WHO_AM_I	r	0F	000 1111	00110010	Dummy register
Reserved (do not modify)		10 - 1F			Reserved
CTRL_REG1	rw	20	010 0000	00000111	
CTRL_REG2	rw	21	010 0001	00000000	
CTRL_REG3	rw	22	010 0010	00000000	
CTRL_REG4	rw	23	010 0011	00000000	
CTRL_REG5	rw	24	010 0100	00000000	
HP_FILTER_RESET	r	25	010 0101		Dummy register
REFERENCE	rw	26	010 0110	00000000	
STATUS_REG	r	27	010 0111	00000000	
Reserved (do not modify)		28	010 1000		Reserved
OUT_X	r	29	010 1001	Output	
Reserved (do not modify)		2A	010 1010		Reserved
OUT_Y	r	2B	010 1011	Output	
Reserved (do not modify)		2C	010 1100		Reserved
OUT_Z	r	2D	010 1101	Output	
Reserved (do not modify)		2E - 2F			Reserved
INT1_CFG	rw	30	011 0000	00000000	
INT1_SRC	r	31	011 0001	00000000	
INT1_THS	rw	32	011 0010	00000000	
INT1_DURATION	rw	33	011 0011	00000000	
INT2_CFG	rw	34	011 0100	00000000	
INT2_SRC	r	35	011 0101	00000000	
INT2_THS	rw	36	011 0110	00000000	
INT2_DURATION	rw	37	011 0111	00000000	
Reserved (do not modify)		38 - 3F			Reserved

Registers marked as *Reserved* must not be changed as they contain the factory calibration values. Their content is automatically restored when the device is powered up. Writing to those registers may change calibration data and thus lead to improper functioning of the device.

## 7 Register description

The device contains a set of registers which are used to control its behavior and to retrieve acceleration data. The register address, consisting of 7 bits, is used to identify them and to write the data through the serial interface.

### 7.1 WHO\_AM\_I (0Fh)

Table 16. WHO\_AM\_I register

0	0	1	1	0	0	1	0
---	---	---	---	---	---	---	---

Device identification register.

This register contains the device identifier that for the H3LIS200DL is set to 32h.

### 7.2 CTRL\_REG1 (20h)

Table 17. CTRL\_REG1 register

PM2	PM1	PM0	DR1	DR0	Zen	Yen	Xen
-----	-----	-----	-----	-----	-----	-----	-----

Table 18. CTRL\_REG1 description

PM2 - PM0	Power mode selection. Default value: 000 (000: power-down; Others: refer to <a href="#">Table 19</a> )
DR1, DR0	Data rate selection. Default value: 00 (00: 50 Hz; Others: refer to <a href="#">Table 20</a> )
Zen	Z-axis enable. Default value: 1 (0: Z-axis disabled; 1: Z-axis enabled)
Yen	Y-axis enable. Default value: 1 (0: Y-axis disabled; 1: Y-axis enabled)
Xen	X-axis enable. Default value: 1 (0: X-axis disabled; 1: X-axis enabled)

The **PM** bits allow the user to select between power-down and two operating active modes. The device is in power-down mode when the PD bits are set to “000” (default value after boot). [Table 19](#) shows all the possible power mode configurations and respective output data rates. Output data in the low-power mode are computed with the low-pass filter cutoff frequency defined by the DR1, DR0 bits.

The **DR** bits, in normal mode operation, select the data rate at which acceleration samples are produced. In low-power modes they define the output data resolution. [Table 20](#) shows all the possible configurations for the DR1 and DR0 bits.

Table 19. Power mode and low-power output data rate configurations

PM2	PM1	PM0	Power mode selection	Output data rate [Hz] ODR <sub>LP</sub>
0	0	0	Power-down	--
0	0	1	Normal mode	ODR
0	1	0	Low power	0.5
0	1	1	Low power	1
1	0	0	Low power	2
1	0	1	Low power	5
1	1	0	Low power	10

Table 20. Normal mode output data rate configurations and low-pass cutoff frequencies

DR1	DR0	Output data rate [Hz] ODR	Low-pass filter cutoff frequency [Hz]
0	0	50	37
0	1	100	74
1	0	400	292
1	1	1000	780

### 7.3 CTRL\_REG2 (21h)

Table 21. CTRL\_REG2 register

BOOT	HPM1	HPM0	FDS	HPen2	HPen1	HPCF1	HPCF0
------	------	------	-----	-------	-------	-------	-------

Table 22. CTRL\_REG2 description

BOOT	Reboot memory content. Default value: 0 (0: normal mode; 1: reboot memory content)
HPM1, HPM0	High-pass filter mode selection. Default value: 00 (00: normal mode; Others: refer to <a href="#">Table 23</a> )
FDS	Filtered data selection. Default value: 0 (0: internal filter bypassed; 1: data from internal filter sent to output register)
HPen2	High-pass filter enabled for interrupt 2 source. Default value: 0 (0: filter bypassed; 1: filter enabled)
HPen1	High-pass filter enabled for interrupt 1 source. Default value: 0 (0: filter bypassed; 1: filter enabled)
HPCF1, HPCF0	High-pass filter cutoff frequency configuration. Default value: 00 (00: HPC=8; 01: HPC=16; 10: HPC=32; 11: HPC=64)

The **BOOT** bit is used to refresh the content of the internal registers stored in the Flash memory block. At device power-up, the content of the Flash memory block is transferred to the internal registers related to trimming functions in order to permit correct operation of the device itself. If for any reason the content of the trimming registers is changed, it is sufficient to use this bit to restore the correct values. When the BOOT bit is set to '1', the content of the internal Flash is copied inside the corresponding internal registers and it is used to calibrate the device. These values are factory trimmed and they are different for every accelerometer. They permit correct operation of the device and normally they do not have to be changed. At the end of the boot process the BOOT bit is set again to '0'.

**Table 23. High-pass filter mode configuration**

HPM1	HPM0	High-pass filter mode
0	0	Normal mode (reset by reading HP_RESET_FILTER)
0	1	Reference signal for filtering
1	0	Normal mode (reset by reading HP_RESET_FILTER)

**HPCF[1:0]**. These bits are used to configure the high-pass filter cutoff frequency  $f_t$  which is given by:

$$f_t = \ln\left(1 - \frac{1}{\text{HPC}}\right) \cdot \frac{f_s}{2\pi}$$

The equation can be simplified to the following approximated equation:

$$f_t = \frac{f_s}{6 \cdot \text{HPC}}$$

**Table 24. High-pass filter cutoff frequency configuration**

HPcoeff2,1	$f_t$ [Hz]	$f_t$ [Hz]	$f_t$ [Hz]	$f_t$ [Hz]
	Data rate = 50 Hz	Data rate = 100 Hz	Data rate = 400 Hz	Data rate = 1000 Hz
00	1	2	8	20
01	0.5	1	4	10
10	0.25	0.5	2	5
11	0.125	0.25	1	2.5

## 7.4 CTRL\_REG3 [interrupt CTRL register] (22h)

**Table 25. CTRL\_REG3 register**

IHL	PP_OD	LIR2	I2_CFG1	I2_CFG0	LIR1	I1_CFG1	I1_CFG0
-----	-------	------	---------	---------	------	---------	---------

**Table 26. CTRL\_REG3 description**

IHL	Interrupt active high, low. Default value: 0 (0: active high; 1: active low)
PP_OD	Push-pull/open drain selection on interrupt pad. Default value 0. (0: push-pull; 1: open drain)
LIR2	Latch interrupt request on INT2_SRC register, with INT2_SRC register cleared by reading INT2_SRC itself. Default value: 0. (0: interrupt request not latched; 1: interrupt request latched)
I2_CFG1, I2_CFG0	Data signal on INT 2 pad control bits. Default value: 00. (see <a href="#">Table 27</a> )
LIR1	Latch interrupt request on the INT1_SRC register, with the INT1_SRC register cleared by reading the INT1_SRC register. Default value: 0. (0: interrupt request not latched; 1: interrupt request latched)
I1_CFG1, I1_CFG0	Data signal on INT 1 pad control bits. Default value: 00. (see <a href="#">Table 27</a> )

**Table 27. Data signal on INT 1 and INT 2 pad**

I1(2)_CFG1	I1(2)_CFG0	INT 1(2) Pad
0	0	Interrupt 1 (2) source
0	1	Interrupt 1 source OR interrupt 2 source
1	0	Data ready
1	1	Boot running

## 7.5 CTRL\_REG4 (23h)

**Table 28. CTRL\_REG4 register**

0	0	0	FS	0	0	0	SIM
---	---	---	----	---	---	---	-----

**Table 29. CTRL\_REG4 description**

FS	Full-scale selection. Default value: 0. (0: $\pm 100\text{ g}$ ; 1: $\pm 200\text{ g}$ )
SIM	SPI serial interface mode selection. Default value: 0. (0: 4-wire interface; 1: 3-wire interface)

## 7.6 CTRL\_REG5 (24h)

**Table 30. CTRL\_REG5 register**

0	0	0	0	0	0	TurnOn1	TurnOn0
---	---	---	---	---	---	---------	---------

**Table 31. CTRL\_REG5 description**

TurnOn1, TurnOn0	Turn-on mode selection for sleep-to-wake function. Default value: 00.
---------------------	---

The **turn-on** bits are used for turning on the **sleep-to-wake** function.

**Table 32. Sleep-to-wake configuration**

TurnOn1	TurnOn0	Sleep-to-wake status
0	0	Sleep-to-wake function is disabled
1	1	Turned on: The device is in low-power mode (ODR is defined in CTRL_REG1)

Setting TurnOn[1:0] bits to 11, the “sleep-to-wake” function is enabled. When an interrupt event occurs, the device is turned to normal mode, increasing the ODR to the value defined in CTRL\_REG1. Although the device is in normal mode, CTRL\_REG1 content is not automatically changed to “normal mode” configuration.

## 7.7 HP\_FILTER\_RESET (25h)

Dummy register. Reading at this address zeroes instantaneously the content of the internal high-pass filter. If the high-pass filter is enabled, all three axes are instantaneously set to 0 g. This allows the settling time of the high-pass filter to be overcome.

## 7.8 REFERENCE (26h)

**Table 33. REFERENCE register**

Ref7	Ref6	Ref5	Ref4	Ref3	Ref2	Ref1	Ref0
------	------	------	------	------	------	------	------

**Table 34. REFERENCE description**

Ref7 - Ref0	Reference value for high-pass filter. Default value: 00h.
-------------	---

This register sets the acceleration value taken as a reference for the high-pass filter output.

When the filter is turned on (at least one of the FDS, HPen2, or HPen1 bits is equal to ‘1’) and the HPM bits are set to “01”, filter-out is generated, taking this value as a reference.

## 7.9 STATUS\_REG (27h)

**Table 35. STATUS\_REG register**

ZYXOR	ZOR	YOR	XOR	ZYXDA	ZDA	YDA	XDA
-------	-----	-----	-----	-------	-----	-----	-----

**Table 36. STATUS\_REG description**

ZYXOR	X, Y and Z-axis data overrun. Default value: 0 (0: no overrun has occurred; 1: new data has overwritten the previous data before it was read)
ZOR	Z-axis data overrun. Default value: 0 (0: no overrun has occurred; 1: new data for the Z-axis has overwritten the previous data)
YOR	Y-axis data overrun. Default value: 0 (0: no overrun has occurred; 1: new data for the Y-axis has overwritten the previous data)
XOR	X-axis data overrun. Default value: 0 (0: no overrun has occurred; 1: new data for the X-axis has overwritten the previous data)
ZYXDA	X, Y and Z-axis new data available. Default value: 0 (0: a new set of data is not yet available; 1: a new set of data is available)
ZDA	Z-axis new data available. Default value: 0 (0: new data for the Z-axis is not yet available; 1: new data for the Z-axis is available)
YDA	Y-axis new data available. Default value: 0 (0: new data for the Y-axis is not yet available; 1: new data for the Y-axis is available)
XDA	X-axis new data available. Default value: 0 (0: new data for the X-axis is not yet available; 1: new data for the X-axis is available)

### 7.10 OUT\_X (29h)

X-axis acceleration data. The value is expressed as two's complement.

### 7.11 OUT\_Y (2Bh)

Y-axis acceleration data. The value is expressed as two's complement.

### 7.12 OUT\_Z (2Dh)

Z-axis acceleration data. The value is expressed as two's complement.

## 7.13 INT1\_CFG (30h)

**Table 37. INT1\_CFG register**

AOI	0	ZHIE	ZLIE	YHIE	YLIE	XHIE	XLIE
-----	---	------	------	------	------	------	------

**Table 38. INT1\_CFG description**

AOI	AND/OR combination of interrupt events. Default value: 0. (See <a href="#">Table 39</a> )
ZHIE	Enable interrupt generation on Z high event. Default value: 0 (0: disable interrupt request; 1: enable interrupt request on measured accel. value higher than preset threshold)
ZLIE	Enable interrupt generation on Z low event. Default value: 0 (0: disable interrupt request; 1: enable interrupt request on measured accel. value lower than preset threshold)
YHIE	Enable interrupt generation on Y high event. Default value: 0 (0: disable interrupt request; 1: enable interrupt request on measured accel. value higher than preset threshold)
YLIE	Enable interrupt generation on Y low event. Default value: 0 (0: disable interrupt request; 1: enable interrupt request on measured accel. value lower than preset threshold)
XHIE	Enable interrupt generation on X high event. Default value: 0 (0: disable interrupt request; 1: enable interrupt request on measured accel. value higher than preset threshold)
XLIE	Enable interrupt generation on X low event. Default value: 0 (0: disable interrupt request; 1: enable interrupt request on measured accel. value lower than preset threshold)

Configuration register for interrupt 1 source.

**Table 39. Interrupt 1 source configurations**

AOI	Interrupt mode
0	OR combination of interrupt events
1	AND combination of interrupt events

## 7.14 INT1\_SRC (31h)

**Table 40. INT1\_SRC register**

0	IA	ZH	ZL	YH	YL	XH	XL
---	----	----	----	----	----	----	----

**Table 41. INT1\_SRC description**

IA	Interrupt active. Default value: 0 (0: no interrupt has been generated; 1: one or more interrupts have been generated)
ZH	Z high. Default value: 0 (0: no interrupt, 1: Z high event has occurred)
ZL	Z low. Default value: 0 (0: no interrupt; 1: Z low event has occurred)
YH	Y high. Default value: 0 (0: no interrupt, 1: Y high event has occurred)
YL	Y low. Default value: 0 (0: no interrupt, 1: Y low event has occurred)
XH	X high. Default value: 0 (0: no interrupt, 1: X high event has occurred)
XL	X low. Default value: 0 (0: no interrupt, 1: X low event has occurred)

Interrupt 1 source register. Read-only register.

Reading at this address clears the INT1\_SRC IA bit (and the interrupt signal on the INT 1 pin) and allows the refresh of data in the INT1\_SRC register if the latched option is chosen.

## 7.15 INT1\_THS (32h)

**Table 42. INT1\_THS register**

0	THS6	THS5	THS4	THS3	THS2	THS1	THS0
---	------	------	------	------	------	------	------

**Table 43. INT1\_THS description**

THS6 - THS0	Interrupt 1 threshold. Default value: 000 0000
-------------	--

## 7.16 INT1\_DURATION (33h)

**Table 44. INT1\_DURATION register**

0	D6	D5	D4	D3	D2	D1	D0
---	----	----	----	----	----	----	----

**Table 45. INT1\_DURATION description**

D6 - D0	Duration value. Default value: 000 0000
---------	---

The **D6 - D0** bits set the minimum duration of the interrupt 1 event to be recognized. Duration steps and maximum values depend on the ODR chosen.

## 7.17 INT2\_CFG (34h)

**Table 46. INT2\_CFG register**

AOI	0	ZHIE	ZLIE	YHIE	YLIE	XHIE	XLIE
-----	---	------	------	------	------	------	------

**Table 47. INT2\_CFG description**

AOI	AND/OR combination of interrupt events. Default value: 0. (See <a href="#">Table 48</a> )
ZHIE	Enable interrupt generation on Z high event. Default value: 0 (0: disable interrupt request; 1: enable interrupt request on measured accel. value higher than preset threshold)
ZLIE	Enable interrupt generation on Z low event. Default value: 0 (0: disable interrupt request; 1: enable interrupt request on measured accel. value lower than preset threshold)
YHIE	Enable interrupt generation on Y high event. Default value: 0 (0: disable interrupt request; 1: enable interrupt request on measured accel. value higher than preset threshold)
YLIE	Enable interrupt generation on Y low event. Default value: 0 (0: disable interrupt request; 1: enable interrupt request on measured accel. value lower than preset threshold)
XHIE	Enable interrupt generation on X high event. Default value: 0 (0: disable interrupt request; 1: enable interrupt request on measured accel. value higher than preset threshold)
XLIE	Enable interrupt generation on X low event. Default value: 0 (0: disable interrupt request; 1: enable interrupt request on measured accel. value lower than preset threshold)

Configuration register for interrupt 2 source.

**Table 48. Interrupt mode configuration**

AOI	Interrupt mode
0	OR combination of interrupt events
1	AND combination of interrupt events

## 7.18 INT2\_SRC (35h)

Table 49. INT2\_SRC register

0	IA	ZH	ZL	YH	YL	XH	XL
---	----	----	----	----	----	----	----

Table 50. INT2\_SRC description

IA	Interrupt active. Default value: 0 (0: no interrupt has been generated; 1: one or more interrupts have been generated)
ZH	Z high. Default value: 0 (0: no interrupt, 1: Z high event has occurred)
ZL	Z low. Default value: 0 (0: no interrupt; 1: Z low event has occurred)
YH	Y high. Default value: 0 (0: no interrupt, 1: Y high event has occurred)
YL	Y low. Default value: 0 (0: no interrupt, 1: Y low event has occurred)
XH	X high. Default value: 0 (0: no interrupt, 1: X high event has occurred)
XL	X Low. Default value: 0 (0: no interrupt, 1: X low event has occurred)

Interrupt 2 source register. Read-only register.

Reading at this address clears the INT2\_SRC IA bit (and the interrupt signal on the INT 2 pin) and allows the refresh of data in the INT2\_SRC register if the latched option is chosen.

## 7.19 INT2\_THS (36h)

Table 51. INT2\_THS register

0	THS6	THS5	THS4	THS3	THS2	THS1	THS0
---	------	------	------	------	------	------	------

Table 52. INT2\_THS description

THS6 - THS0	Interrupt 2 threshold. Default value: 000 0000
-------------	--

## 7.20 INT2\_DURATION (37h)

Table 53. INT2\_DURATION register

0	D6	D5	D4	D3	D2	D1	D0
---	----	----	----	----	----	----	----

Table 54. INT2\_DURATION description

D6 - D0	Duration value. Default value: 000 0000
---------	---

The **D6 - D0** bits set the minimum duration of the interrupt 2 event to be recognized. Duration time steps and maximum values depend on the ODR chosen.

## 8 Package information

In order to meet environmental requirements, ST offers these devices in different grades of ECOPACK® packages, depending on their level of environmental compliance. ECOPACK specifications, grade definitions and product status are available at: [www.st.com](http://www.st.com). ECOPACK is an ST trademark.

Table 55. TFLGA 3x3x1.0 mm<sup>3</sup> 16L mechanical data

Dim.	mm		
	Min.	Typ.	Max.
A1			1
A2		0.785	
A3		0.200	
D1	2.850	3.000	3.150
E1	2.850	3.000	3.150
L1		1.000	1.060
L2		2.000	2.060
N1		0.500	
N2		1.000	
M	0.040	0.100	0.160
P1		0.875	
P2		1.275	
T1	0.290	0.350	0.410
T2	0.190	0.250	0.310
d		0.150	
k		0.050

Компания «Life Electronics» занимается поставками электронных компонентов импортного и отечественного производства от производителей и со складов крупных дистрибьюторов Европы, Америки и Азии.

С конца 2013 года компания активно расширяет линейку поставок компонентов по направлению коаксиальный кабель, кварцевые генераторы и конденсаторы (керамические, пленочные, электролитические), за счёт заключения дистрибьюторских договоров

Мы предлагаем:

- Конкуренспособные цены и скидки постоянным клиентам.
- Специальные условия для постоянных клиентов.
- Подбор аналогов.
- Поставку компонентов в любых объемах, удовлетворяющих вашим потребностям.
- Приемлемые сроки поставки, возможна ускоренная поставка.
- Доставку товара в любую точку России и стран СНГ.
- Комплексную поставку.
- Работу по проектам и поставку образцов.
- Формирование склада под заказчика.
- Сертификаты соответствия на поставляемую продукцию (по желанию клиента).
- Тестирование поставляемой продукции.
- Поставку компонентов, требующих военную и космическую приемку.
- Входной контроль качества.
- Наличие сертификата ISO.

В составе нашей компании организован Конструкторский отдел, призванный помогать разработчикам, и инженерам.

Конструкторский отдел помогает осуществить:

- Регистрацию проекта у производителя компонентов.
- Техническую поддержку проекта.
- Защиту от снятия компонента с производства.
- Оценку стоимости проекта по компонентам.
- Изготовление тестовой платы монтаж и пусконаладочные работы.
