

AC/DC-sensitive Differential Current Sensors (DI-Sensors)

- Closed loop sensors with magnetic probe for highest accuracy and reliability
- Differential current range typically 30 to 300 mA
- Full load current to 50 A
- Single +5 V voltage supply
- Voltage output for direct connection at A/D – converters
- Automatic demagnetization of the sensor core for offset decrease
- Self-monitoring and test functions
- Measuring accuracy 1.5%
- Smallest temperature drift, highest long-term stability
- Metal screen against external fields
- Frequency range DC to 10 kHz
- Variants with passing through opening and with integrated primary conductors, with or without test winding
- Active sensors with integrated electronics
- Economical construction

Applications

Control devices with AC/DC-sensitive differential current sensors are used primarily in transformerless solar inverters. An important safety function of these

devices is the monitoring of the leakage current of the entire system from photovoltaic - modules and inverter against earth. A defective system can become dangerous for people or release fires. Before it comes so far, the inverter must disconnect from the grid. The leakage current contains DC and AC components. Therefore an AC/DC-sensitive monitoring unit is necessary. Their heart is the VAC differential current sensor, whose output voltage is evaluated by the control system of the solar inverter.

Generally protection devices with AC/DC-sensitive differential current sensors can be used everywhere, where flat or pulsating DC can develop, whose amount is permanently greater than zero. Further examples are power supplies producing high DC voltages or uninterruptable power supplies.

Variants of the VAC Sensors

It is both a type available with an opening for the primary conductor, as well as types with built-in primary conductors for PCB mounting. There are versions with two or four conductors for single and three phase systems.

The additional functions demagnetization, error signaling and internal test power are accessible through defined levels at the inputs / outputs V_{out} and V_{ref} .

Functional description, technical data, available Types

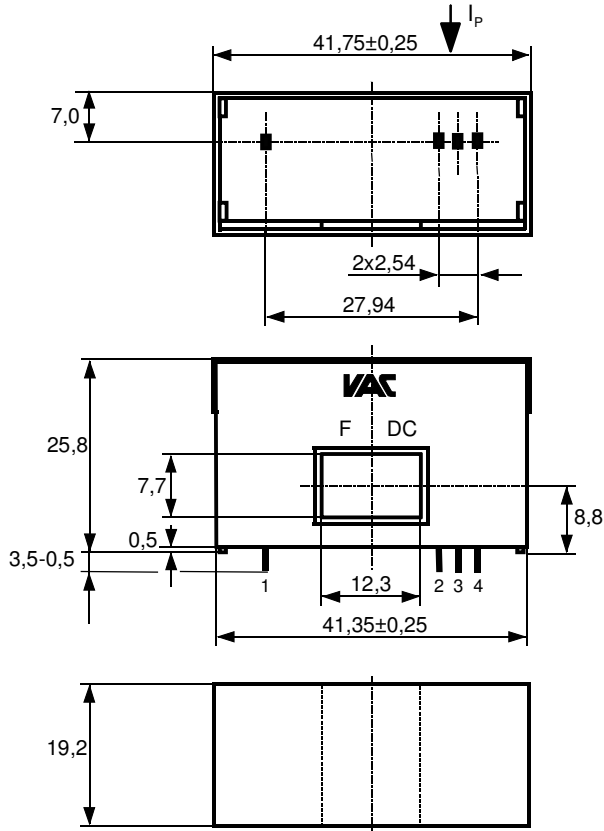

Item no.	T60404-N4646-			
	... X950	... X960	... X975	...X976
Style				
Dimensional diagram no.	1	2	3	4
Primary conductor style	opening	via PCB. Two conductors A= 6,2 mm ² for operating current	via PCB. Two conductors A= 6,2 mm ² for operating current, one conductor for external test current	via PCB. Four conductors A= 4,9 mm ² for operating current, one conductor for external test current
Properties				
Supply voltage	5 V			
Supply current	typ. 17 mA			
Maximum primary current	50 A			
Nominal differential current	300 mA			
Output voltage	reference voltage $\pm (0,74 \times \text{differential current} / 300 \text{ mA})$			
Measuring range	$\pm 850 \text{ mA}$			
Output voltage range	0,5 V ... 4,5 V			
Reference voltage	2,5 V reference voltage, internally generated or $V_{ref}=1.4$ to 3.5 from external source			
Frequency range	0 ... 10 kHz, limited by internal low pass filter. An additional external filter with e.g. 5 kHz roll off frequency is recommended.			
Measuring error at $T_{amb} = 25^{\circ}\text{C}$	< 1,5 % of nominal differential current			
Temperature drift -40 ... +85°C	< 0,1 mV/°C			
Response time (up to 90% of nominal differential current)	< 35 μs			
Isolation strength acc. to EN50178 (primary- and test current conductor vs. signal and supply voltage connections) - system voltage - working voltage	to be maintained by a proper insulation of the primary onductor		600 V 1.000 V	
Additional functions				
Error condition - indicated by - criteria	- output voltage < 0,5 V - break or short circuit of the magnetic probe, supply voltage smaller 4 Volts, during the demagnetization cycle.			
Demagnetization of the Sensor core - triggered by - duration of cycle	- feeding the supply voltage <i>or</i> transition from <1 V to 2,5 V (normal voltage) at the reference voltage input, i.e. after test current cycle - 120 ms			
Internal DC test current for self test - triggered by - output signal at test current	- setting reference voltage to 0 V (<1 V) - $U_{DC} = +0,25 \text{ V}$ at $V_{ref} = 0 \text{ V}$. A possibly appearing primary current is superimposed

Компания «Life Electronics» занимается поставками электронных компонентов импортного и отечественного производства от производителей и со складов крупных дистрибьюторов Европы, Америки и Азии.

С конца 2013 года компания активно расширяет линейку поставок компонентов по направлению коаксиальный кабель, кварцевые генераторы и конденсаторы (керамические, пленочные, электролитические), за счёт заключения дистрибьюторских договоров

Мы предлагаем:

- Конкурентоспособные цены и скидки постоянным клиентам.
- Специальные условия для постоянных клиентов.
- Подбор аналогов.
- Поставку компонентов в любых объемах, удовлетворяющих вашим потребностям.
- Приемлемые сроки поставки, возможна ускоренная поставка.
- Доставку товара в любую точку России и стран СНГ.
- Комплексную поставку.
- Работу по проектам и поставку образцов.
- Формирование склада под заказчика.
- Сертификаты соответствия на поставляемую продукцию (по желанию клиента).
- Тестирование поставляемой продукции.
- Поставку компонентов, требующих военную и космическую приемку.
- Входной контроль качества.
- Наличие сертификата ISO.

В составе нашей компании организован Конструкторский отдел, призванный помогать разработчикам, и инженерам.

Конструкторский отдел помогает осуществить:

- Регистрацию проекта у производителя компонентов.
- Техническую поддержку проекта.
- Защиту от снятия компонента с производства.
- Оценку стоимости проекта по компонентам.
- Изготовление тестовой платы монтаж и пусконаладочные работы.
