

## Dual 50MHz to 1000MHz High-Linearity, Serial/Parallel-Controlled Analog/Digital VGA

### General Description

The MAX2062 high-linearity, dual analog/digital variable-gain amplifier (VGA) operates in the 50MHz to 1000MHz frequency range with two independent attenuators in each signal path. Each digital attenuator is controlled as a slave peripheral using either the SPI-compatible interface, or a 5-bit parallel bus with 31dB total adjustment range in 1dB steps. An added feature allows rapid-fire gain selection among each of the four steps, preprogrammed by the user through the SPI-compatible interface. A separate 2-pin control lets the user quickly access any one of four customized attenuation states without reprogramming the SPI bus. Each analog attenuator is controlled using an external voltage or through the SPI-compatible interface using an on-chip 8-bit DAC.

Since each of the stages has its own external RF input and RF output, this component can be configured to either optimize noise figure (NF) (amplifier configured first), OIP3 (amplifier last), or a compromise of NF and OIP3. The device's performance features include 24dB amplifier gain (amplifier only), 7.3dB NF at maximum gain (includes attenuator insertion losses), and a high OIP3 level of +41dBm. Each of these features makes the device an ideal VGA for multipath receiver and transmitter applications.

In addition, the device operates from a single +5V supply with full performance or a +3.3V supply for an enhanced power-savings mode with lower performance. The device is available in a compact 48-pin TQFN package (7mm x 7mm) with an exposed pad. Electrical performance is guaranteed over the extended temperature range, from  $T_C = -40^\circ\text{C}$  to  $+85^\circ\text{C}$ .

### Applications

IF and RF Gain Stages  
 Temperature-Compensation Circuits  
 GSM/EDGE Base Stations  
 WCDMA, TD-SCDMA, and cdma2000® Base Stations  
 WiMAX®, LTE, and TD-LTE Base Stations and Customer-Premise Equipment  
 Fixed Broadband Wireless Access  
 Wireless Local Loop

### Features

- ◆ Independently Controlled Dual Paths
- ◆ 50MHz to 1000MHz RF Frequency Range
- ◆ Pin-Compatible Family Includes  
     MAX2063 (Digital-Only VGA)  
     MAX2064 (Analog-Only VGA)
- ◆ 19.4dB (typ) Maximum Gain
- ◆ 0.34dB Gain Flatness Over 100MHz Bandwidth
- ◆ 64dB Gain Range (33dB Analog Plus 31dB Digital)
- ◆ 56dB Path Isolation (at 200MHz)
- ◆ Built-In 8-Bit DACs for Analog Attenuation Control
- ◆ Supports Four Rapid-Fire Preprogrammed Attenuator States  
     Quickly Access Any One of Four Customized Attenuator States  
     Ideal for Fast-Attack, High-Level Blocker Protection  
     Protects ADC Overdrive Condition
- ◆ Excellent Linearity (Configured with Amp Last at 200MHz)  
     +41dBm OIP3  
     +56dBm OIP2  
     +19dBm Output 1dB Compression Point
- ◆ 7.3dB Typical Noise Figure (at 200MHz)
- ◆ Fast, 25ns Digital Switching
- ◆ Very Low Digital VGA Amplitude Overshoot/Undershoot
- ◆ Single +5V Supply (or +3.3V Operation)
- ◆ Amplifier Power-Down Mode for TDD Applications

### Ordering Information

PART	TEMP RANGE	PIN-PACKAGE
MAX2062ETM+	-40°C to +85°C	48 TQFN-EP*
MAX2062ETM+T	-40°C to +85°C	48 TQFN-EP*

+ Denotes lead(Pb)-free/RoHS-compliant package.

\*EP = Exposed pad.

T = Tape and reel.

cdma2000 is a registered certification mark and registered service mark of the Telecommunications Industry Association.

WiMAX is a registered certification mark and registered service mark of the WiMAX Forum.

## Dual 50MHz to 1000MHz High-Linearity, Serial/Parallel-Controlled Analog/Digital VGA

### ABSOLUTE MAXIMUM RATINGS

VCC_AMP_1, VCC_AMP_2, VCC_RG to GND .....	-0.3V to +5.5V	REG_OUT to GND.....	-0.3V to +3.6V
STA_A_1, STA_A_2, STA_B_1, STA_B_2,		RF Input Power (D_ATT_IN_1, D_ATT_IN_2) .....	+20dBm
PD_1, PD_2, AMPSET to GND .....	-0.3V to +3.6V	RF Input Power (A_ATT_IN_1, A_ATT_IN_2) .....	+20dBm
A_VCTL_1, A_VCTL_2 to GND.....	-0.3V to +3.6V	RF Input Power (AMP_IN_1, AMP_IN_2).....	+18dBm
DAT, CS, CLK, AA_SP, DA_SP to GND .....	-0.3V to +3.6V	$\theta_{JC}$ (Notes 1, 2).....	+12.3°C/W
D0_1, D1_1, D2_1, D3_1, D4_1, D0_2, D1_2,		$\theta_{JA}$ (Notes 2, 3).....	+38°C/W
D2_2, D3_2, D4_2 to GND .....	-0.3V to +3.6V	Continuous Power Dissipation (Note 1) .....	5.3W
AMP_IN_1, AMP_IN_2 to GND.....	+0.95V to +1.2V	Operating Case Temperature Range (Note 4) ..	-40°C to +85°C
AMP_OUT_1, AMP_OUT_2 to GND .....	-0.3V to +5.5V	Junction Temperature .....	+150°C
D_ATT_IN_1, D_ATT_IN_2, D_ATT_OUT_1,		Storage Temperature Range.....	-65°C to +150°C
D_ATT_OUT_2 to GND.....	0V to +3.6V	Lead Temperature (soldering, 10s) .....	+300°C
A_ATT_IN_1, A_ATT_IN_2, A_ATT_OUT_1,		Soldering Temperature (reflow) .....	+260°C
A_ATT_OUT_2 to GND .....	0V to +3.6V		

**Note 1:** Based on junction temperature  $T_J = T_C + (\theta_{JC} \times V_{CC} \times I_{CC})$ . This formula can be used when the temperature of the exposed pad is known while the device is soldered down to a PCB. See the *Applications Information* section for details. The junction temperature must not exceed +150°C.

**Note 2:** Package thermal resistances were obtained using the method described in JEDEC specification JESD51-7, using a four-layer board. For detailed information on package thermal considerations, refer to [www.maximintegrated.com/thermal-tutorial](http://www.maximintegrated.com/thermal-tutorial).

**Note 3:** Junction temperature  $T_J = T_A + (\theta_{JA} \times V_{CC} \times I_{CC})$ . This formula can be used when the ambient temperature of the PCB is known. The junction temperature must not exceed +150°C.

**Note 4:**  $T_C$  is the temperature on the exposed pad of the package.  $T_A$  is the ambient temperature of the device and PCB.

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

### 5.0V SUPPLY DC ELECTRICAL CHARACTERISTICS

(Typical Application Circuit,  $V_{CC} = V_{CC\_AMP\_1} = V_{CC\_AMP\_2} = V_{CC\_RG} = 4.75V$  to  $5.25V$ ,  $AMPSET = 0$ ,  $PD_1 = PD_2 = 0$ ,  $T_C = -40^\circ C$  to  $+85^\circ C$ . Typical values are at  $V_{CC} = 5.0V$  and  $T_C = +25^\circ C$ , unless otherwise noted.)

PARAMETER	SYMBOL	CONDITIONS	MIN	TYP	MAX	UNITS
Supply Voltage	$V_{CC}$		4.75	5	5.25	V
Supply Current	$I_{DC}$			148	210	mA
Power-Down Current	$I_{DCPD}$	$PD_1 = PD_2 = 1, V_{IH} = 3.3V$		5.3	8	mA
Logic-Low Input Voltage	$V_{IL}$				0.5	V
Logic-High Input Voltage	$V_{IH}$		1.7		3.465	V
Input Logic Current	$I_{IH}, I_{IL}$		-1		+1	$\mu A$

### 3.3V SUPPLY DC ELECTRICAL CHARACTERISTICS

(Typical Application Circuit,  $V_{CC} = V_{CC\_AMP\_1} = V_{CC\_AMP\_2} = V_{CC\_RG} = 3.135V$  to  $3.465V$ ,  $AMPSET = 1$ ,  $PD_1 = PD_2 = 0$ ,  $T_C = -40^\circ C$  to  $+85^\circ C$ . Typical values are at  $V_{CC} = 3.3V$  and  $T_C = +25^\circ C$ , unless otherwise noted.)

PARAMETER	SYMBOL	CONDITIONS	MIN	TYP	MAX	UNITS
Supply Voltage	$V_{CC}$		3.135	3.3	3.465	V
Supply Current	$I_{DC}$			87	145	mA
Power-Down Current	$I_{DCPD}$	$PD_1 = PD_2 = 1, V_{IH} = 3.3V$		4.5	8	mA
Logic-Low Input Voltage	$V_{IL}$				0.5	V
Logic-High Input Voltage	$V_{IH}$		1.7			V

—	EP	Exposed Pad. Internally connected to GND. Connect to GND for proper RF performance and enhanced thermal dissipation.

### Detailed Description

The MAX2062 high-linearity analog/digital VGA is a general-purpose, high-performance amplifier designed to interface with 50Ω systems operating in the 50MHz to 1000MHz frequency range.

Each channel of the device integrates one digital attenuator and one analog attenuator to provide 64dB of total gain control, as well as a driver amplifier optimized to provide high gain, high IP3, low NF, and low power consumption.

Each digital attenuator is controlled as a slave peripheral using either the SPI-compatible interface, or a 5-bit parallel bus with 31dB total adjustment range in 1dB steps. An added feature allows rapid-fire gain selection among each of the four steps, preprogrammed by the user through the SPI-compatible interface. A separate 2-pin control lets the user quickly access any one of four customized attenuation states without reprogramming the SPI bus. Each analog attenuator is controlled using an external voltage or through the SPI-compatible interface using an on-chip 8-bit DAC. See the *Applications Information* section for attenuator programming details.

Because each of the three stages in the separate signal paths has its own RF input and RF output, this component can be configured to either optimize NF (amplifier configured first), OIP3 (amplifier last), or a compromise of NF and OIP3. The device's performance features include 24dB amplifier gain (amplifier only), 7.3dB NF at maximum gain (includes attenuator insertion losses),

and a high OIP3 level of +41dBm. Each of these features makes the device an ideal VGA for multipath receiver and transmitter applications.

In addition, the device operates from a single +5V supply with full performance, or a +3.3V supply for an enhanced power-savings mode with lower performance. The device is available in a compact 48-pin TQFN package (7mm x 7mm) with an exposed pad. Electrical performance is guaranteed over the extended temperature range (T<sub>C</sub> = -40°C to +85°C).

### Analog and 5-Bit Digital Attenuator Control

The device integrates two analog attenuators and two 5-bit digital attenuators to achieve a high level of dynamic range. Each analog attenuator has a 33dB range and is controlled using an external voltage or through the 3-wire SPI interface using an on-chip 8-bit DAC. Each digital attenuator has a 31dB control range, a 1dB step size, and is programmed either through the 3-wire SPI or through a separate 5-bit parallel bus. See the *Applications Information* section and Table 1 for attenuator programming details. The attenuators can be used for both static and dynamic power control.

Note that when the analog attenuators are controlled by the DACs through the SPI bus, the DAC output voltage shows on pins A\_VCTL\_1 and A\_VCTL\_2 (pins 39 and 22, respectively). Therefore, in SPI mode, the A\_VCTL\_1 and A\_VCTL\_2 pins must only connect to the resistor and capacitor to ground, as shown in the *Typical Application Circuit*.

## Dual 50MHz to 1000MHz High-Linearity, Serial/Parallel-Controlled Analog/Digital VGA

**Table 1. Control Logic**

AA_SP	ANALOG ATTENUATOR	D/A CONVERTER
0	Controlled by external control voltage	Disabled
1	Controlled by on-chip DAC	Enabled (DAC output voltage shows on A_VCTL__ pins); DAC uses on-chip voltage reference
DA_SP	DIGITAL ATTENUATOR	
0	Parallel controlled	
1	SPI controlled (control voltages show up on the parallel control pins)	

### Driver Amplifier

Each path of the device includes a high-performance driver with a fixed gain of 24dB. The driver amplifier circuits are optimized for high linearity for the 50MHz to 1000MHz frequency range.

### Applications Information

#### Operating Modes

The device features an optional +3.3V supply voltage operation with reduced linearity performance. The AMPSET pin needs to be biased accordingly in each mode, as listed in Table 2. In addition, the driver amplifiers can be shut down independently to conserve DC power. See the biasing scheme outlined in Table 2 for details.

#### SPI Interface and Attenuator Settings

The digital attenuators can be programmed through the 3-wire SPI/MICROWIRE®-compatible serial interface using 5-bit words. Fifty-six bits of data are shifted in MSB first and are framed by  $\overline{CS}$ . The first 28 bits set the first attenuator and the following 28 bits set the second attenuator. When  $\overline{CS}$  is low, the clock is active and data is shifted on the rising edge of the clock. When  $\overline{CS}$  transitions high, the data is latched and the attenuator setting changes (Figure 1). See Table 3 for details on the SPI data format.

**Table 2. Operating Modes**

RESULT	V <sub>CC</sub> (V)	AMPSET	PD_1	PD_2
All on	5	0	0	0

## Dual 50MHz to 1000MHz High-Linearity, Serial/Parallel-Controlled Analog/Digital VGA

### Attenuator and DAC Operation

The two analog attenuators are controlled by an external control voltage applied at A\_VCTL\_1 and A\_VCTL\_2 (pins 39 and 22) or by the on-chip 8-bit DACs, while the digital attenuators are controlled through the SPI-compatible interface or through two independent, parallel 5-bit buses. The DAC enable/disable logic-input pin (AA\_SP) and digital attenuator SPI/parallel control selection logic-input pin (DA\_SP) determine how the attenuators are controlled.

### Digital Attenuator Settings Using the Parallel Control Bus

To capitalize on its fast 25ns switching capability, the device offers a supplemental 5-bit parallel control interface. The digital logic attenuator control pins (D0–D4) enable the attenuator stages (see Tables 3 and 4).

Direct access to these 5-bit buses enables the user to avoid any programming delays associated with the SPI interface. One of the limitations of any SPI bus is the speed at which commands can be clocked into each peripheral device. By offering direct access to the 5-bit parallel interface, the user can quickly shift between digital attenuator states needed for critical fast-attack automatic gain control (AGC) applications.

Note that when the digital attenuators are controlled by the SPI bus, the control voltages of each digital attenuator appears on the five parallel control pins (pins 14–17

and 19 for digital attenuator 2, pins 42 and 44–47 for digital attenuator 1). **When the digital attenuators are in SPI mode, the parallel control pins must be left unconnected.**

### Rapid-Fire Preprogrammed Attenuation States

The device has an added feature that provides rapid-fire gain selection among four preprogrammed attenuation steps. As with the supplemental 5-bit buses previously mentioned, this rapid-fire gain selection allows the user to quickly access any one of four customized digital attenuation states without incurring the delays associated with reprogramming the device through the SPI bus.

The switching speed is comparable to that achieved using the supplemental 5-bit parallel buses. However, by employing this specific feature, the digital attenuator I/O is further reduced by a factor of either 5 or 2.5 (5 control bits vs. 1 or 2, respectively), depending on the number of states desired.

The user can employ the STA\_A\_1 and STA\_B\_1 (STA\_A\_2 and STA\_B\_2 for digital attenuator 2) logic-input pins to apply each step as required (see Tables 5 and 6). Toggling just the STA\_A\_1 pin (1 control bit) yields two preprogrammed attenuation states; toggling both the STA\_A\_1 and STA\_B\_1 pins together (2 control bits) yields four preprogrammed attenuation states.

**Table 4. Digital Attenuator Settings (Parallel Control, DA\_SP = 0)**

INPUT	LOGIC = 0 (OR GROUND)	LOGIC = 1
D0	Disable 1dB attenuator	Enable 1dB attenuator
D1	Disable 2dB attenuator	Enable 2dB attenuator
D2	Disable 4dB attenuator	Enable 4dB attenuator
D3	Disable 8dB attenuator	Enable 8dB attenuator
D4	Disable 16dB attenuator	Enable 16dB attenuator

# MAX2062

## Dual 50MHz to 1000MHz High-Linearity, Serial/Parallel-Controlled Analog/Digital VGA

As an example, assume that the AGC application requires a static attenuation adjustment to trim out gain inconsistencies within a receiver lineup. The same AGC circuit can also be called upon to dynamically attenuate an unwanted blocker signal that could desensitize the receiver and lead to an ADC overdrive condition. In this example, the device would be preprogrammed (through the SPI bus) with two customized attenuation states—one to address the static gain-trim adjustment, the second to counter the unwanted blocker condition.

Toggling just the STA\_A\_1 control bit enables the user to switch quickly between the static and dynamic attenuation settings with only one I/O pin.

If desired, the user can also program two additional attenuation states by using the STA\_B\_1 control bit as a second I/O pin. These two additional attenuation settings are useful for software-defined radio applications where multiple static gain settings are needed to account for different frequencies of operation, or where multiple dynamic attenuation settings are needed to account for different blocker levels (as defined by multiple wireless standards).

### Power-Supply Sequencing

The sequence to be used is:

- 1) Power supply
- 2) Control lines

### Layout Considerations

The pin configuration of the device is optimized to facilitate a very compact physical layout of the device and its associated discrete components. The exposed pad (EP) of the device's 48-pin TQFN-EP package provides a low thermal-resistance path to the die. It is important that the PCB on which the device is mounted be designed to conduct heat from the EP. In addition, provide the EP with a low inductance path to electrical ground. The EP **MUST** be soldered to a ground plane on the PCB, either directly or through an array of plated via holes. The layout of the PCB should include proper top-layer ground shielding to isolate the amplifier's inputs and outputs from each other. Shielding between the paths (inputs and outputs) is important for channel-to-channel isolation.

Maxim Integrated cannot assume responsibility for use of any circuitry other than circuitry entirely embodied in a Maxim Integrated product. No circuit patent licenses are implied. Maxim Integrated reserves the right to change the circuitry and specifications without notice at any time. The parametric values (min and max limits) shown in the Electrical Characteristics table are guaranteed. Other parametric values quoted in this data sheet are provided for guidance.

Компания «Life Electronics» занимается поставками электронных компонентов импортного и отечественного производства от производителей и со складов крупных дистрибьюторов Европы, Америки и Азии.

С конца 2013 года компания активно расширяет линейку поставок компонентов по направлению коаксиальный кабель, кварцевые генераторы и конденсаторы (керамические, пленочные, электролитические), за счёт заключения дистрибьюторских договоров

Мы предлагаем:

- Конкуренспособные цены и скидки постоянным клиентам.
- Специальные условия для постоянных клиентов.
- Подбор аналогов.
- Поставку компонентов в любых объемах, удовлетворяющих вашим потребностям.
- Приемлемые сроки поставки, возможна ускоренная поставка.
- Доставку товара в любую точку России и стран СНГ.
- Комплексную поставку.
- Работу по проектам и поставку образцов.
- Формирование склада под заказчика.
- Сертификаты соответствия на поставляемую продукцию (по желанию клиента).
- Тестирование поставляемой продукции.
- Поставку компонентов, требующих военную и космическую приемку.
- Входной контроль качества.
- Наличие сертификата ISO.

В составе нашей компании организован Конструкторский отдел, призванный помогать разработчикам, и инженерам.

Конструкторский отдел помогает осуществить:

- Регистрацию проекта у производителя компонентов.
- Техническую поддержку проекта.
- Защиту от снятия компонента с производства.
- Оценку стоимости проекта по компонентам.
- Изготовление тестовой платы монтаж и пусконаладочные работы.
