# EL8170, EL8173

Micropower, Single Supply, Rail-to-Rail Input-Output Instrumentation Amplifiers

The EL8170 and EL8173 are micropower instrumentation amplifiers optimized for single supply operation over the +2.4V to +5.5V range. Inputs and outputs can operate rail-to-rail. As with all instrumentation amplifiers, a pair of inputs provide very high common-mode rejection and are completely independent from a pair of feedback terminals. The feedback terminals allow zero input to be translated to any output offset, including ground. A feedback divider controls the overall gain of the amplifier.

The EL8170 is compensated for a gain of 100 or more, and the EL8173 is compensated for a gain of 10 or more. The EL8170 and EL8173 have bipolar input devices for best offset and $1/f$ noise performance.

The amplifiers can be operated from one lithium cell or two Ni-Cd batteries. The EL8170 and EL8173 input range includes ground to slightly above positive rail. The output stage swings to ground and positive supply (no pull-up or pull-down resistors are needed).

## Pin Configurations

### EL8170
### (8 LD SOIC)
### TOP VIEW

### EL8173
### (8 LD SOIC)
### TOP VIEW

## Features

- 95µA maximum supply current
- Maximum offset voltage
  - 200µV (EL8170)
  - 1000µV (EL8173)
- Maximum 3nA input bias current
- 396kHz -3dB bandwidth (G = 10)
- 192kHz -3dB bandwidth (G = 100)
- Single supply operation
  - Input voltage range is rail-to-rail
  - Output swings rail-to-rail
- Pb-Free (RoHS Compliant)

## Applications

- Battery- or Solar-Powered Systems
- Strain Gauges
- Current Monitors
- Thermocouple Amplifiers

## Ordering Information

NOTES:

1. Add "-T*" suffix for tape and reel. Please refer to TB347 for details on reel specifications.

2. These Intersil Pb-free plastic packaged products employ special Pb-free material sets, molding compounds/die attach materials, and 100% matte tin plate plus anneal (e3 termination finish, which is RoHS compliant and compatible with both SnPb and Pb-free soldering operations). Intersil Pb-free products are MSL classified at Pb-free peak reflow temperatures that meet or exceed the Pb-free requirements of IPC/JEDEC J STD-020.

3. For Moisture Sensitivity Level (MSL), please see device information page for EL8170, EL8173 For more information on MSL, please see tech brief TB363.

# Description of Operation and Applications Information

## Product Description

The EL8170 and EL8173 are micropower instrumentation amplifiers (in-amps) which deliver rail-to-rail input amplification and rail-to-rail output swing on a single +2.4V to +5.5V supply. The EL8170 and EL8173 also deliver excellent DC and AC specifications while consuming only 65μA typical supply current. The EL8170 and EL8173 provides an independent pairs of feedback terminals to set the gain and to adjust output level, these in-amps achieve high common-mode rejection ratio regardless of the tolerance of the gain setting resistors. The EL8173 is internally compensated for a minimum closed loop gain of 10 or greater, well suited for moderate to high gains. For higher gains, the EL8170 is internally compensated for a minimum gain of 100.

## Input Protection

All input and feedback terminals of the EL8170 and EL8173 have internal ESD protection diodes to both positive and negative supply rails, limiting the input voltage to within one diode drop beyond the supply rails. The inverting inputs and FB- have ESD diodes to the V-rail, and the non-inverting inputs and FB+ terminals have ESD diodes to the V+ rail. The EL8170 has

additional back-to-back diodes across the input terminals and also across the feedback terminals. If overdriving the inputs is necessary, the external input current must never exceed 5mA. On the other hand, the EL8173 has no clamps to limit the differential voltage on the input terminals allowing higher differential input voltages at lower gain applications. It is recommended however, that the input terminals of the EL8173 are not overdriven beyond 1V to avoid offset drift. An external series resistor may be used as an external protection to limit excessive external voltage and current from damaging the inputs.

## Input Stage and Input Voltage Range

The input terminals (IN+ and IN-) of the EL8170 and EL8173 are single differential pair bipolar PNP devices aided by an Input Range Enhancement Circuit to increase the headroom of operation of the common-mode input voltage. The feedback terminals (FB+ and FB-) also have a similar topology. As a result, the input common-mode voltage range of both the EL8170 and EL8173 is rail-to-rail. These in-amps are able to handle the input voltages that are at or slightly beyond the supply and ground making these in-amps well suited for single +5V or +3.3V low voltage supply systems. There is no need to move the common-mode input of the in-amps to achieve symmetrical input voltage.

# Input Bias Cancellation, Input Bias Compensation

The EL8170 and EL8173 are features an Input Bias Cancellation and Input Bias Compensation Circuit for both the input and feedback terminals (IN+, IN-, FB+ and FB-), achieving a low input bias current all throughout the input common-mode range and the operating temperature range. While the PNP bipolar input stages are biased with an adequate amount of biasing current for speed and increased noise performance, the Input Bias Cancellation and the Input Bias Compensation Circuit, sinks most of the base current of the input transistor leaving a small portion as input bias current, typically 500pA. In addition, the Input Bias Cancellation and Input Bias Compensation Circuit, maintains a smooth and flat behavior of the input bias current over the common mode range and over the operating temperature range. The Input Bias Cancellation and Input Bias Compensation Circuit, operates from the input voltages of 10mV above the negative supply to the input voltages slightly above the positive supply. See "Average Input Bias Current vs Common-Mode Input Voltage" in the "Typical Performance Curves" beginning on page 4.

## Output Stage and Output Voltage Range

A pair of complementary MOSFET devices drives the output $V_{OUT}$ to within a few millivolts of the supply rails. At a 100k$\Omega$ load, the PMOS sources current and pulls the output up to 4mV below the positive supply, while the NMOS sinks current and pulls the output down to 4mV above the negative supply, or ground in the case of a single supply operation. The current sinking and sourcing capability of the EL8170 and EL8173 are internally limited to 26mA.

## Gain Setting

$V_{IN}$, the potential difference across IN+ and IN-, is replicated (less the input offset voltage) across FB+ and FB-. The objective of the EL8170 and EL8173 in-amp is to maintain the differential voltage across FB+ and FB- equal to IN+ and IN-; (FB- - FB+) = (IN+ - IN-). Consequently, the transfer function can be derived. The gain of the EL8170 and EL8173 is set by two external resistors, the feedback resistor $R_F$, and the gain resistor $R_G$.

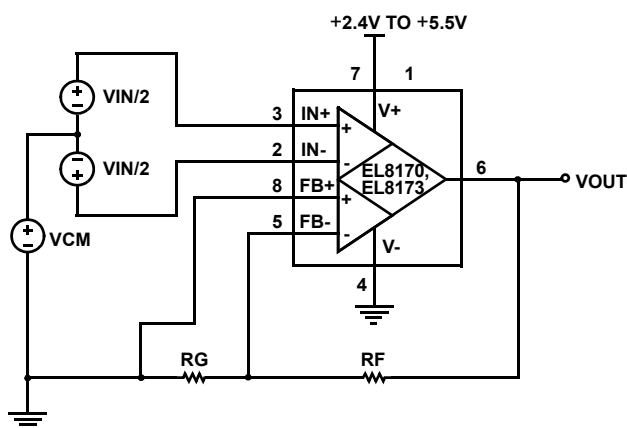

FIGURE 37. GAIN IS SET BY TWO EXTERNAL RESISTORS, $R_F$ AND $R_G$

$$V_{OUT} = \left(1 + \frac{R_F}{R_G}\right) V_{IN} \qquad \text{(EQ. 1)}$$

In Figure 37, the FB+ pin and one end of resistor $R_G$ are connected to GND. With this configuration, Equation 1 is only true for a positive swing in VIN; negative input swings will be ignored and the output will be at ground.

## Reference Connection

Unlike a three op amp instrumentation amplifier, a finite series resistance seen at the REF terminal does not degrade the EL8170 and EL8173's high CMRR performance, eliminating the need for an additional external buffer amplifier. The circuit shown in Figure 38 uses the FB+ pin as a REF terminal to center or to adjust the output. Because the FB+ pin is a high impedance input, an economical resistor divider can be used to set the voltage at the REF terminal. The reference voltage error due to the input bias current is minimized by keeping the values of the voltage divider resistors, $R_1$ and $R_2$, as low as possible. Any voltage applied to the REF terminal will shift $V_{OUT}$ by VREF times the closed loop gain, which is set by resistors $R_F$ and $R_G$ according to Equation 2. Note that any noise or unwanted signals on the reference supply will be amplified at the output according to Equation 2.

$$V_{OUT} = \left(1 + \frac{R_F}{R_G}\right)(V_{IN}) + \left(1 + \frac{R_F}{R_G}\right)(V_{REF}) \qquad \text{(EQ. 2)}$$

FIGURE 38. GAIN SETTING AND REFERENCE CONNECTION

The FB+ pin can also be connected to the other end of resistor, $R_G$ (see Figure 39). Keeping the basic concept that the EL8170 and EL8173 in-amps maintain constant differential voltage across the input terminals and feedback terminals (IN+ - IN- = FB+ - FB-), the transfer function of Figure 39 can be derived (Equation 3). Note that the $V_{REF}$ gain term is eliminated, and susceptibility to external noise is reduced.

RENESAS

FIGURE 39. REFERENCE CONNECTION WITH AN AVAILABLE V~REF~

$$V_{OUT} = \left(1 + \frac{R_F}{R_G}\right)(V_{IN}) + (V_{REF}) \qquad \text{(EQ. 3)}$$

## External Resistor Mismatches

Because of the independent pair of feedback terminals provided by the EL8170 and EL8173, the CMRR is not degraded by any resistor mismatches. Hence, unlike a three op amp and especially a two op amp in-amp, the EL8170 and EL8173 reduce the cost of external components by allowing the use of 1% or more tolerance resistors without sacrificing CMRR performance. The EL8170 and EL8173 CMRR is maintained regardless of the tolerance of the resistors used.

## Gain Error and Accuracy

The EL8173 has a Gain Error, $E_G$, of 0.2% typical. The EL8170 has an $E_G$ of 0.3% typical. The gain error indicated in the "Electrical Specifications" table on page 2 is the inherent gain error of the EL8170 and EL8173 and does not include the gain error contributed by the resistors. There is an additional gain error due to the tolerance of the resistors used. The resulting non-ideal transfer function effectively becomes Equation 4:

$$V_{OUT} = \left(1 + \frac{R_F}{R_G}\right) \times [1 - (E_{RG} + E_{RF} + E_G)] \times V_{IN} \qquad \text{(EQ. 4)}$$

Where:

$E_{RG}$ = Tolerance of $R_G$

$E_{RF}$ = Tolerance of $R_F$

$E_G$ = Gain Error of the EL8170 or EL8173

The term $[1 - (E_{RG} + E_{RF} + E_G)]$ is the deviation from the theoretical gain. Thus, $(E_{RG} + E_{RF} + E_G)$ is the total gain error. For example, if 1% resistors are used for the EL8170, the total gain error would be as shown in Equation 5:

$$
\begin{aligned}
&= \pm(E_{RG} + E_{RF} + E_G(\text{typical})) \\
&= \pm(0.01 + 0.01 + 0.003) \qquad \text{(EQ. 5)} \\
&= \pm 2.3\%
\end{aligned}
$$

# Power Dissipation

It is possible to exceed the +150°C maximum junction temperatures under certain load and power-supply conditions. It is therefore important to calculate the maximum junction temperature ($T_{JMAX}$) for all applications to determine if power supply voltages, load conditions, or package type need to be modified to remain in the safe operating area. These parameters are related in Equation 6:

$$T_{JMAX} = T_{MAX} + (\theta_{JA} \times PD_{MAXTOTAL}) \qquad \text{(EQ. 6)}$$

where:

- $PD_{MAXTOTAL}$ is the sum of the maximum power dissipation of each amplifier in the package ($PD_{MAX}$)
- $PD_{MAX}$ for each amplifier can be calculated as shown in Equation 7:

$$PD_{MAX} = 2 \ast V_S \times I_{SMAX} + (V_S - V_{OUTMAX}) \times \frac{V_{OUTMAX}}{R_L} \qquad \text{(EQ. 7)}$$

where:

- $T_{MAX}$ = Maximum ambient temperature
- $\theta_{JA}$ = Thermal resistance of the package
- $PD_{MAX}$ = Maximum power dissipation of 1 amplifier
- $V_S$ = Supply voltage (Magnitude of $V_+$ and $V_-$)
- $I_{MAX}$ = Maximum supply current of 1 amplifier
- $V_{OUTMAX}$ = Maximum output voltage swing of the application
- $R_L$ = Load resistance

# About Intersil

Intersil Corporation is a leading provider of innovative power management and precision analog solutions. The company's products address some of the largest markets within the industrial and infrastructure, mobile computing and high-end consumer markets.

For the most updated datasheet, application notes, related documentation and related parts, please see the respective product information page found at www.intersil.com.

You may report errors or suggestions for improving this datasheet by visiting www.intersil.com/ask.

Reliability reports are also available from our website at www.intersil.com/support

For additional products, see www.intersil.com/en/products.html

Intersil products are manufactured, assembled and tested utilizing ISO9001 quality systems as noted in the quality certifications found at www.intersil.com/en/support/qualandreliability.html

*Intersil products are sold by description only. Intersil may modify the circuit design and/or specifications of products at any time without notice, provided that such modification does not, in Intersil's sole judgment, affect the form, fit or function of the product. Accordingly, the reader is cautioned to verify that datasheets are current before placing orders. Information furnished by Intersil is believed to be accurate and reliable. However, no responsibility is assumed by Intersil or its subsidiaries for its use; nor for any infringements of patents or other rights of third parties which may result from its use. No license is granted by implication or otherwise under any patent or patent rights of Intersil or its subsidiaries.*

Компания «Life Electronics» занимается поставками электронных компонентов импортного и отечественного производства от производителей и со складов крупных дистрибьюторов Европы, Америки и Азии.

С конца 2013 года компания активно расширяет линейку поставок компонентов по направлению коаксиальный кабель, кварцевые генераторы и конденсаторы (керамические, пленочные, электролитические), за счёт заключения дистрибьюторских договоров

Мы предлагаем:

- Конкурентоспособные цены и скидки постоянным клиентам.
- Специальные условия для постоянных клиентов.
- Подбор аналогов.
- Поставку компонентов в любых объемах, удовлетворяющих вашим потребностям.

- Приемлемые сроки поставки, возможна ускоренная поставка.
- Доставку товара в любую точку России и стран СНГ.
- Комплексную поставку.
- Работу по проектам и поставку образцов.
- Формирование склада под заказчика.

- Сертификаты соответствия на поставляемую продукцию (по желанию клиента).
- Тестирование поставляемой продукции.
- Поставку компонентов, требующих военную и космическую приемку.
- Входной контроль качества.
- Наличие сертификата ISO.

В составе нашей компании организован Конструкторский отдел, призванный помогать разработчикам, и инженерам.

Конструкторский отдел помогает осуществить:

- Регистрацию проекта у производителя компонентов.
- Техническую поддержку проекта.
- Защиту от снятия компонента с производства.
- Оценку стоимости проекта по компонентам.
- Изготовление тестовой платы монтаж и пусконаладочные работы.
