

Power Supply, Primary Switch Mode, Narrow Design MINI-PS-100-240AC/24DC/4

MINI POWER provides:

- **Extra narrow** widths of 22.5, 45, and 67.5 mm (0.886, 1.772, and 2.657 in.)
- **Global use** due to a wide range input
- **A high level of operational safety** in complex global networks
- **Reliable startup** of heavy loads due to POWER BOOST

The reliability of a power supply determines the availability of individual components in a system and whether complex systems can function safely.

The globalization of markets increases the demands placed on the power supply. A wide range input and a high level of availability are required. These requirements are met by MINI POWER.

1. Short Description

MINI POWER is the extra narrow power supply, which is available in widths of 22.5, 45, and 67.5 mm (0.886, 1.772, and 2.657 in.).

In addition to a 24 V version with output currents of 1 A, 2 A, and 4 A, special voltages are also available with 5 V/3 A, +/-15 V/1 A, and 10 - 15 V/2 A.

Reliable startup of heavy loads is ensured by a power reserve of up to 100% - the POWER BOOST.

The high level of operational safety is also ensured in complex global networks. MINI POWER also operates in applications where static voltage dips, transient power supply failures or phase failure are common.

Large capacitors ensure mains buffering of more than 20 ms at full load.

2. Area of Application

MINI POWER can be used globally due to the consistent provision of a wide range input.

In this way, your entire system can be tested at any production location in the world and can be delivered to any location in the world without faulty switching of the input voltage. This reduces storage costs and logistical effort.

An international approval package including UL 60950 for IT equipment and UL 508 for industrial control equipment enables the device to be used globally.

General Data			
Insulation voltage:		3 kV AC (type test)/3 kV AC (routine test)

4. Device View, Connections, and Control Elements

Figure 04

- ① **AC input:**
Input voltage 85 - 264 V AC
Frequency 45 - 65 Hz
(0.2 mm² to 2.5 mm² solid)
(0.2 mm² to 2.5 mm² flexible) (25 - 14 AWG)
Internal fuse T3.15 AL 250 V
Recommended fuse
6 A or 10 A c.b./Characteristic B
- ② **DC output:**
Output voltage 24 V DC (default),
can be set from 22.5 - 28.5 V DC using
a potentiometer (4) (0.2 mm² to 2.5 mm² solid)
(0.2 mm² to 2.5 mm² flexible) (25 - 14 AWG)
The device is idling-proof and short-circuit-proof.
- ③ **DC OK output active**
- ④ **Potentiometer 22.5 - 28.5 V DC**
- ⑤ **DC OK LED**
- ⑥ **Universal latching foot for EN DIN rails**

Installation and startup must only be carried out by qualified personnel. The relevant country-specific regulations (e.g., VDE, DIN) must also be observed.

Before startup it is particularly important to ensure that:

- The mains have been connected correctly and protection is provided against electric shock.
- The device can be switched off outside the power supply according to EN 60950 regulations (e.g., by the line protection on the primary side).
- All supply lines have sufficient fuse protection and are the correct size.
- All output cables are the correct size for the maximum device output current or have separate fuse protection.
- Sufficient convection is ensured.

MINI POWER is a built-in device. After installation the terminal area must be covered to provide sufficient protection against unauthorized access to live parts. This is ensured by installing the device in the control cabinet or distributor box.

The device contains dangerous live components and high levels of stored energy.

5. Safety and Warning Instructions

To ensure that the device can be operated safely and all functions can be used, please read these instructions carefully.

Caution: Never carry out work when the power is turned on, this is highly dangerous.

6. Installation

6.1. Mounting

The power supply can be snapped onto all DIN rails according to EN 50022-35. The device must be mounted horizontally (input terminal blocks facing downwards).

Installation Dimensions

To ensure sufficient convection, we recommend a minimum spacing of 5 cm (1.969 in.) to other modules above and below the device.

Figure 05

Figure 06

Mounting:

Place the module with the DIN rail guideway on the **top edge** of the DIN rail and then snap it **downwards**.

Removal:

Release the snap-on catch using a screwdriver and then detach the module from the **bottom edge** of the DIN rail.

Figure 07

6.2. Connection of Various Types of Network: 100 - 240 V AC Networks

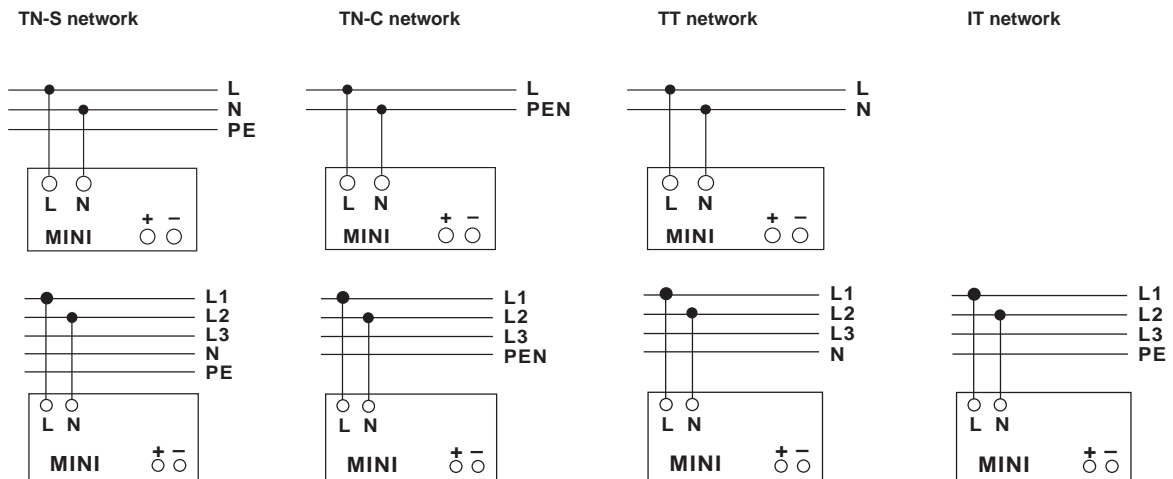

Figure 08

Connection Cable:

The device is equipped with COMBICON connectors. This reliable user-friendly connection method enables quick device connection and safe isolation of the electrical connection, if required. **Only operate connectors when the power is switched off.**

The following cable cross sections can be connected:

	Solid [mm ²]	Flexible [mm ²]	AWG	Torque [Nm]	Torque [lb in.]
① Input:	0.2 - 2.5	0.2 - 2.5	25 - 14	0.5 - 0.6	4.4 - 5.3
② Output:	0.2 - 2.5	0.2 - 2.5	25 - 14	0.5 - 0.6	4.4 - 5.3
③ Signal:	0.2 - 2.5	0.2 - 2.5	25 - 14	0.5 - 0.6	4.4 - 5.3

For reliable and safe-to-touch connection: Strip 7 mm (0.28 in.) from the connector ends.

6.3. Input (①, Figure 9)

The 100 - 240 V AC connection is made using screw connections L and N. The device can be connected to single-phase AC networks or to two external conductors for three-phase networks (TN, TT or IT network according to VDE 0100 T300/IEC364-3) with nominal voltages of 100 - 240 V AC.

Protecting the Primary Side

The device must be installed according to the specifications of EN 60 950. It must be possible to switch off the device using a suitable disconnecting device outside the power supply.

Note that an all-pole disconnecting device must be provided for two-phase operation using two external conductors for a three-phase network.

For example, primary side line protection could be used.

Additional device protection is not required, as an internal fuse is present.

Recommended Fuse:

Circuit breaker 6 A or 10 A, Characteristic B (or equivalent).

Figure 09

A suitable fuse must be fitted for DC applications.

If the internal fuse is blown, this is most probably due to a device fault. In this case, the device should be checked in the factory.

6.4. Output (② , Figure 9)

NEC Class 2 power supply when installed with a 4.2 amp maximum, UL listed fuse or circuit breaker in the output of the power supply. This procedure must be followed to meet NEC Class 2 requirements

Protecting the Secondary Side:

The device is electronic short-circuit-proof and idling-proof. In the event of an error, the output voltage is limited to a maximum of 35 V DC.

It should be ensured that all output cables are the correct size for the maximum output current or have separate fuse protection.

The secondary side cables should have large cross sections to keep voltage drops on the cables to a minimum.

Active signal output (③ , Figure 10)

The 24 V DC signal is between the "DC OK" and "-" connection terminal blocks and can be loaded with 20 mA maximum. This signal output indicates that the output voltage has fallen below 21.5 V DC when "active high" changes to "low".

The DC OK signal is isolated from the power output. This ensures that a separate supply does not enter from devices connected in parallel.

The 24 V DC signal can be connected directly to the logic input for evaluation.

DC OK LED

The green DC OK LED enables local function evaluation in the control cabinet.

	Status 1	Status 2
Green "DC OK" LED ⑤	ON	OFF
Active DC OK switching output	$U = +24 \text{ V}$ (with reference to "-")	$U = 0 \text{ V}$ (with reference to "-")
Meaning	Normal operation of the power supply $U_{\text{OUT}} > 21.5 \text{ V}$	$U_{\text{OUT}} \leq 21.5 \text{ V DC}$ <ul style="list-style-type: none"> Secondary load short circuit or overload No mains voltage or device fault

Figure 10

Figure 11

7. Installation

7.1. Output Characteristic Curve

The device can supply a nominal output current of 4 A up to an ambient temperature of 60°C (140°F). With an ambient temperature of up to 40°C (104°F) the device continuously supplies an output current of 5 A. At temperatures up to 60°C (140°F), the POWER BOOST provides a short-term output current of 6 A for a few minutes.

With high loads, the working point demonstrates the U/I characteristic curve shown in Figure 11.

On an overload or short circuit, the entire output current I_{BOOST} is provided permanently at a reduced output voltage.

Once the overload or short circuit has been removed, the entire set secondary voltage is available again.

The U/I characteristic curve ensures that both heavy capacitive loads and devices with DC/DC converters can be supplied by MINI POWER in the input circuit without any problems.

Connected fuses are reliably tripped. The selectivity in your system configuration is ensured at all times.

7.2. Temperature Response

The device can supply a nominal output current of 4 A up to an ambient temperature of 60°C (140°F). With an ambient temperature of up to 40°C (104°F) the device continuously supplies an output current of 5 A. At temperatures up to 60°C (140°F), the POWER BOOST provides a short-term output current of 6 A for a few minutes.

The output power must be decreased by 2.5% per Kelvin temperature increase for ambient temperatures above +60°C (+140°F). At ambient temperatures above +70°C (+158°F) or in the event of a thermal overload, the device reduces the output power to protect itself and returns to normal operation once it has cooled down.

Figure 12

7.3. Parallel Operation

Devices of the same type can be connected in parallel to increase both redundancy and power. The default setting does not have to be adjusted.

If the output voltage is adjusted, an even current distribution can be ensured by precisely setting all power supplies that are operated in parallel to the same output voltage.

To ensure symmetrical current distribution we recommend that all cable connections from the power supply to the DIN rail are the same length and have the same cross section.

Depending on the system, for parallel connection of more than two power supplies a protective circuit should be installed at each individual device output (e.g., decoupling diode or DC fuse). This means that in the event of a secondary device fault high return currents are avoided.

7.4. Redundancy Operation

Redundant connections are designed for supplying systems, which place particularly high requirements on operational safety. If a fault occurs in the primary circuit of device 1, device 2 automatically takes over the complete power supply without interruption and vice versa.

For this purpose, the power supplies to be connected in parallel must be large enough that the total current requirements of all loads can be fully met by one power supply. External decoupling diodes are required for 100% redundancy.

Figure 13

7.5. Power Increase

The output current can be increased to $n \times I_N$ where n is the number of devices connected in parallel.

The parallel connection for power increase can be used to extend existing systems. A parallel connection is recommended if the power supply does not cover the current consumption of the most powerful load. Otherwise, the loads should be divided over independent individual devices.

A maximum of five devices can be connected in parallel.

Figure 14

Компания «Life Electronics» занимается поставками электронных компонентов импортного и отечественного производства от производителей и со складов крупных дистрибьюторов Европы, Америки и Азии.

С конца 2013 года компания активно расширяет линейку поставок компонентов по направлению коаксиальный кабель, кварцевые генераторы и конденсаторы (керамические, пленочные, электролитические), за счёт заключения дистрибьюторских договоров

Мы предлагаем:

- Конкурентоспособные цены и скидки постоянным клиентам.
- Специальные условия для постоянных клиентов.
- Подбор аналогов.
- Поставку компонентов в любых объемах, удовлетворяющих вашим потребностям.
- Приемлемые сроки поставки, возможна ускоренная поставка.
- Доставку товара в любую точку России и стран СНГ.
- Комплексную поставку.
- Работу по проектам и поставку образцов.
- Формирование склада под заказчика.
- Сертификаты соответствия на поставляемую продукцию (по желанию клиента).
- Тестирование поставляемой продукции.
- Поставку компонентов, требующих военную и космическую приемку.
- Входной контроль качества.
- Наличие сертификата ISO.

В составе нашей компании организован Конструкторский отдел, призванный помогать разработчикам, и инженерам.

Конструкторский отдел помогает осуществить:

- Регистрацию проекта у производителя компонентов.
- Техническую поддержку проекта.
- Защиту от снятия компонента с производства.
- Оценку стоимости проекта по компонентам.
- Изготовление тестовой платы монтаж и пусконаладочные работы.
