### General Description

The TS34119 is a low power audio amplifier, it integrated circuit intended (primarily) for telephone applications such as in speakerphones. It provides differential speaker outputs to maximize output swing at low supply voltages (2.0V minimum). Coupling capacitors to the speaker are not required. Open loop gain is 80dB, and the closed loop gain is set with two external resistors. A chip Disable pin permits powering down and/or muting the input signal.

### Features

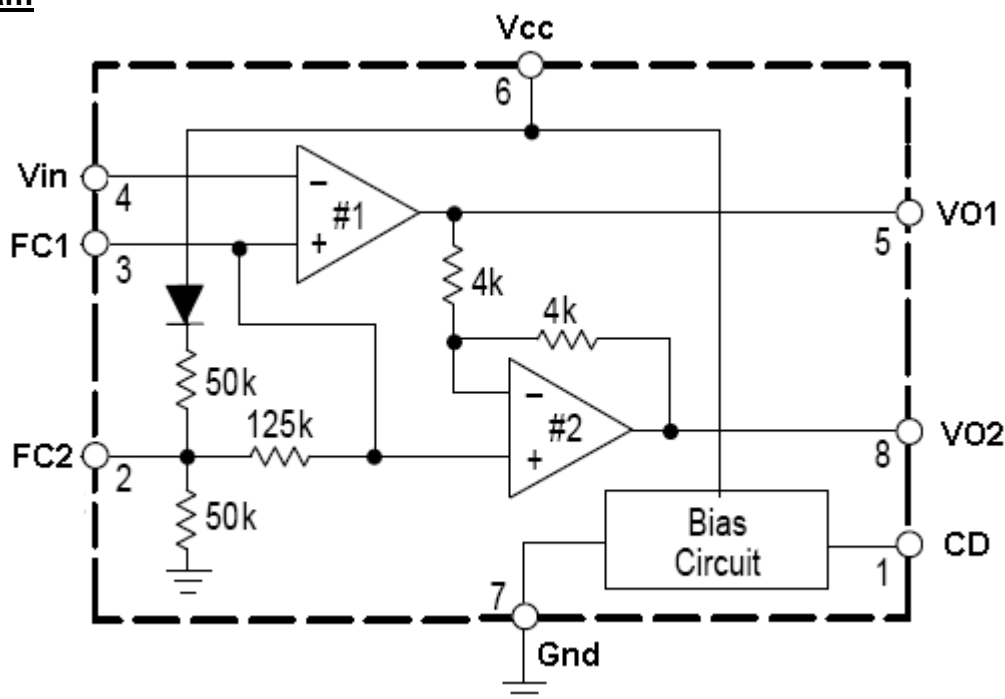

- Wide operating supply voltage (2~16V)
- Chip disable input to power down the IC
- Low quiescent current for battery powered application
- Lower power down quiescent current
- Drives a wide range of speaker load (8~100Ω)
- Output power exceed 250mW with 32Ωspeaker
- Low total harmonic distortion
- Gain adjustable for voice band
- Requires few external components

### Ordering Information

Part No.	Package	Packing
TS34119CS RLG	SOP-8	2,500pcs / 13" Reel

"G" denotes for Halogen free products

### Block Diagram

## Absolute Maximum Rating

Parameter	Symbol	Value	Unit
Supply Voltage	V <sub>CC</sub>	+1 ~ 18V	V
Maximum Input Voltage (FC1, FC2, CD, Vin)	V <sub>in</sub>	-1.0 ~ V <sub>CC</sub> +1.0	V
Applied Output Voltage to VO1, VO2 when disabled	V <sub>VO</sub>	-1.0 ~ V <sub>CC</sub> +1.0	V
Maximum Output Current at VO1, VO2	I <sub>O</sub>	±250	mA
Storage Temperature Range	T <sub>STG</sub>	-65 ~ +150	°C

Note: Maximum ratings are those values beyond which damage to the device may occur, functional operation should be Restricted to the recommended operating conditions.

## Recommended Operating Conditions

Parameter	Symbol	Value	Unit
Supply Voltage	V <sub>CC</sub>	+2 ~ 16V	V
Load Impedance	R <sub>L</sub>	8 ~ 100	Ω
Peak Load Current	I <sub>L</sub>	200	mA
Differential Gain (5kHz bandwidth)	AVD	0 ~ 46	dB
Voltage @ CD (pin 1)	V <sub>CD</sub>	0 ~ V <sub>CC</sub>	V

Note: This device contains protection circuitry to guard against damage due to high static voltage or electric fields. However, precautions must be taken to avoid applications of any voltage higher than maximum rated voltage to this high impedance circuit. For proper operation, V<sub>in</sub> and V<sub>out</sub> should be constrained to the range Gnd ≤ (V<sub>in</sub> or V<sub>out</sub>) ≤ V<sub>CC</sub>. Unused inputs must always be tied to an appropriate logic voltage level (e.g., either Gnd or V<sub>CC</sub>), unused output must be left open.

## Electrical Specifications (V<sub>CD</sub>=0V, T<sub>a</sub>=25°C; unless otherwise noted.)

### Pin Function Description

Symbol	Pin	Description
CD	1	Chip Disable-Digital input. A logic "0" (<0.8V) sets normal operation. A logic "1" ( $\geq 2.0V$ ) sets the power down mode. Input impedance is nominally 90K $\Omega$
FC2	2	A capacitor at this pin increases power supply rejection, and affects turn-on time. This pin can be left open if the capacitor at FC1 is sufficient.
FC1	3	Analog ground for the amplifiers. A 1 $\mu F$ capacitor at this pin (with a 5 $\mu F$ capacitor at pin 2) provides 52dB(typically) of power supply rejection. Turn-on time of the circuit is affected by the capacitor on this pin. This pin can be used as an alternate input.
Vin	4	Amplifier input. The input capacitor and resistor set low frequency roll off and input impedance. The feedback resistor is connected to this pin and VO1.
VO1	5	Amplifier Output #1. The dc level is $\approx (V_{CC} - 0.7) / 2$
V <sub>CC</sub>	6	DC supply voltage (+2.0V ~ +16V) is applied to this pin.
GND	7	Ground pin for the entire circuit.
VO2	8	Amplifier Output #2. This signal is equal in amplitude, but 180° out-of-phase with that at VO1. The dc level is $\approx (V_{CC} - 0.7V) / 2$ .

### Typical Application Circuit

\* Optional  
Differential Gain =  $2 \times (R_f / R_i)$

### Design Guideline

#### GENERAL

The TS34119 is a low power audio amplifier capable of low voltage operation ( $V_{CC}=2.0V$  minimum) such as that encountered in line-powered speakerphones. The circuit provides a differential output (VO1-VO2) to the speaker to maximize the available voltage swing at low voltages. The different gain is set by two external resistors. Pins FC1 and FC2 allow controlling the amount of power supply and noise rejection, as well as providing alternate inputs to the amplifiers. The CD pin permits powering down the IC for muting purposes and to conserve power.

#### AMPLIFIERS

Referring to the block diagram, the internal configuration consists of two identical operational amplifiers. Amplifier #1 has an open loop gain of  $\geq 80\text{dB}$  (at  $f \leq 100\text{Hz}$ ), and the closed loop gain is set by external resistor  $R_f$  and  $R_j$ . The amplifier is unity gain stable, and has a unity gain frequency of approximately  $1.5\text{MHz}$ . In order to adequately cover the telephone voice band ( $300\text{Hz}$  to  $3.4\text{kHz}$ ), a maximum closed loop gain of  $46\text{dB}$  is recommended. Amplifier #2 is internally set to gain of  $-1.0$  ( $0\text{dB}$ ). The outputs of both amplifiers are capable of sourcing and sinking a peak current of  $200\text{mA}$ . The outputs can typically swing to within  $\approx 0.4V$  above ground, and to within  $\approx 1.3V$  below  $V_{CC}$ , at the maximum current. See Figure 18 and 19 for  $V_{OH}$  and  $V_{OL}$  curves. The output dc offset voltage (VO1-VO2) is primarily a function of the feedback resistor ( $R_f$ ), and secondarily due to the amplifiers' input offset voltages. The input offset voltage of the two amplifiers will generally be similar for a particular IC, and therefore nearly cancel each other at the outputs. Amplifier #1's bias current, however, flows out of  $V_{in}$  (pin 4) and through  $R_f$ , forcing VO1 to shift negative by an amount equal to  $(R_f \times I_{IB})$ , Vo2 is shifted positive an equal amount. The output offset voltage, specified in the Electrical Characteristics is measured with the feedback resistor shown in the Typical Application Circuit, and therefore takes into account the bias current as well as internal offset voltages of the amplifiers. The bias current is constant with respect to  $V_{CC}$ .

#### FC1 AND FC2

Power supply rejection is provided by the capacitors ( $C_1$  and  $C_2$  in the typical Application Circuit) at FC1 and FC2.  $C_2$  is somewhat dominant at low frequencies, while  $C_1$  is dominant at high frequencies, as shown in the graphs of Figure 4 to 7. The required values of  $C_1$  and  $C_2$  depend on the conditions of each application. A line powered speakerphone, for example, will require more filtering than a circuit powered by a well regulated power supply. The amount of rejection is function of the capacitors, and the equivalent impedance looking into FC1 and FC2 (listed in the Electrical Characteristics as  $R_{FC1}$  and  $R_{FC2}$ ). In addition to providing filtering,  $C_1$  and  $C_2$  also affect the turn-on time of the circuit at power-up, since the two capacitors must charge up through the internal  $50K$  and  $125K$  resistors. The graph of Figure 1 indicates the turn-on time upon application of  $V_{CC}$  of  $+6V$ . The turn-on time is  $\approx 60\%$  longer for  $V_{CC} = 3V$ , and  $\approx 20\%$  less for  $V_{CC} = 9V$ . Turn-off time is  $< 10\mu\text{s}$  upon removal of  $V_{CC}$ .

#### CHIP DISABLE

The chip Disable (pin 1) can be used to power down the IC to conserve power, or for muting, or both. When at a Logic "0" ( $0V$  to  $0.8V$ ), the TS34119 is enabled for normal operation. When pin 1 is a Logic "1" ( $2V$  to  $V_{CC}$ ), the IC is disabled. If pin 1 is open, that is equivalent to Logic "0" although good design practice dictates that an input should never be left open. Input impedance at pin 1 is a nominal  $90K\Omega$ . The power supply current (when disabled) is shown in Figure 15. Muting, defined as the change in differential gain from normal operation to muted operation, is in excess of  $70\text{dB}$ . The turn-off time the audio output, from the application of the CD signal, is  $< 2\mu\text{s}$ , and turn on-time is  $12\text{ms}$ - $15\text{ms}$ . Both times are independent of  $C_1$ ,  $C_2$ , and  $V_{CC}$ . When the TS34119 is disabled, the voltage at FC1 and FC2 do not change as they are powered from  $V_{CC}$ . The outputs, VO1 and VO2, change to high impedance condition, removing the signal from the speaker. If signals from other sources are to be applied to the outputs (while disabled), they must be within the range of  $V_{CC}$  and Ground.

#### LAYOUT CONSIDERATIONS

Normally a snubber is not needed at the output of the TS34119, unlike many other audio amplifiers. However, the PC board layout, stray capacitances, and the manner in which the speaker wires are configured, may dictate otherwise. Generally, the speaker wires should be twisted tightly, and not more than a few inches in length.

### Design Guideline (Continue)

#### POWER DISSIPATION

Figure 8 to 10 indicate the device dissipation (within the IC) for various combinations of VCC, RL, and load power. The maximum power which can safely be dissipated within the TS34119 is found from the following equation:

$$PD = (140^{\circ}\text{C} - T_a) / \theta_{ja}$$

Where  $T_a$  is the ambient temperature; and  $\theta_{ja}$  is the package thermal resistance ( $100^{\circ}\text{C/W}$  for the standard DIP package, and  $180^{\circ}\text{C/W}$  for the surface mount package.) The power dissipated within the TS34119, in a given application, it is found from the following equation:  $PD = (V_{CC} \times I_{CC}) + (I_{RMS} \times V_{CC}) - (R_L \times I_{RMS}^2)$

Where  $I_{CC}$  is obtained from Figure 15; and  $I_{RMS}$  is the RMS current at the load; and  $R_L$  is load resistance. Figure 8 to 10, along with Figure 11 to 13 (distortion curves), and a peak working load current of  $\pm 200\text{mA}$ , define the operating range for the TS34119. The operating range is further defined in terms of allowable load power in Figure 14 for loads of  $8\Omega$ ,  $16\Omega$  and  $32\Omega$ . The left (ascending) portion of each of the three curves is defined by the power level at which 10% distortion occurs. The center flat portion of each curve is defined by the maximum output current capability of the TS34119. The right (descending) portion of each curve is defined by the maximum internal power dissipation of the IC at  $25^{\circ}\text{C}$ . At higher ambient temperatures, the maximum load power must be reduced according to the above equations. Operating the device beyond the current and junction temperature limits will degrade long-term reliability.

Компания «Life Electronics» занимается поставками электронных компонентов импортного и отечественного производства от производителей и со складов крупных дистрибьюторов Европы, Америки и Азии.

С конца 2013 года компания активно расширяет линейку поставок компонентов по направлению коаксиальный кабель, кварцевые генераторы и конденсаторы (керамические, пленочные, электролитические), за счёт заключения дистрибьюторских договоров

Мы предлагаем:

- Конкурентоспособные цены и скидки постоянным клиентам.
- Специальные условия для постоянных клиентов.
- Подбор аналогов.
- Поставку компонентов в любых объемах, удовлетворяющих вашим потребностям.
- Приемлемые сроки поставки, возможна ускоренная поставка.
- Доставку товара в любую точку России и стран СНГ.
- Комплексную поставку.
- Работу по проектам и поставку образцов.
- Формирование склада под заказчика.
- Сертификаты соответствия на поставляемую продукцию (по желанию клиента).
- Тестирование поставляемой продукции.
- Поставку компонентов, требующих военную и космическую приемку.
- Входной контроль качества.
- Наличие сертификата ISO.

В составе нашей компании организован Конструкторский отдел, призванный помогать разработчикам, и инженерам.

Конструкторский отдел помогает осуществить:

- Регистрацию проекта у производителя компонентов.
- Техническую поддержку проекта.
- Защиту от снятия компонента с производства.
- Оценку стоимости проекта по компонентам.
- Изготовление тестовой платы монтаж и пусконаладочные работы.
