

NCN5150

Wired M-BUS Slave Transceiver

Description

The NCN5150 is a single-chip integrated slave transceiver for use in two-wire Meter Bus (M-BUS) slave devices and repeaters. The transceiver provides all of the functions needed to satisfy the European Standards EN 13757-2 and EN 1434-3 describing the physical layer requirements for M-BUS. It includes a programmable power level of up to 2 (SOIC version) or 6 (NQFP version) unit loads, which are available for use in external circuits through a 3.3 V LDO regulator.

The NCN5150 can provide communication up to the maximum M-BUS communication speed of 38,400 baud (half-duplex).

Features

- Single-chip MBUS Transceiver
- UART Communication Speeds Up to 38,400 baud
- Integrated 3.3 V VDD LDO Regulator with Extended Peak Current Capability of 15 mA
- Supports Powering Slave Device from the Bus or from External Power Supply
- Adjustable I/O Levels
- Adjustable Constant Current Sink up to 2 or 6 Unit Loads Depending on the Package
- Low Bus Voltage Operation
- Extended Current Budget for External Circuits: at least 0.88 mA
- Polarity Independent
- Power-Fail Function
- Fast Startup – No External Transistor Required on STC Pin
- Industrial Ambient Temperature Range of -40°C to +85°C
- Available in:
 - ♦ 16-pin SOIC (Pin-to-Pin Compatible with TSS721A)
 - ♦ 20-pin QFN
- These are Pb-free Devices

Typical Applications

- Multi-energy Utility Meters
 - ♦ Water
 - ♦ Gas
 - ♦ Electricity
 - ♦ Heating systems

Related Standards – European Standard

APPLICATION INFORMATION

The NCN5150 is a slave transceiver for use in the meter bus (M-BUS) protocol. The bus connection is fully polarity independent. The transceiver will translate the bus voltage modulation from master-to-slave communication to TTL UART communication, and in the other direction translate UART voltage levels to bus current modulation. The transceiver also integrates a voltage regulator for utilizing the current drawn in this way from the bus, and an early power fail warning. The transceiver also supports an external power supply and the I/O high level can be set to match the slave sensor circuit. A complete block diagram is shown in Figure 2. Each section will be explained in more detail below.

Meter Bus Protocol

M-BUS is a European standard for communication and powering of utility meters and other sensors. Communication from master to slave is achieved by voltage-level signaling. The master will apply a nominal +36 V to the bus in idle state, or when transmitting a logical 1 (“mark”). When transmitting a logical 0 (“space”), the master will drop the bus voltage to a nominal +24 V.

Communication from the slave to the master is achieved by current modulation. In idle mode or when transmitting a logical 1 (“mark”), the slave will draw a fixed current from the bus. When transmitting a logical 0 (“space”), the slave will draw an extra nominal 15 mA from the bus. M-BUS uses a half-duplex 11-bit UART frame format, with 1 start bit, 8 data bits, 1 even parity bit, and a stop bit.

Communication speeds allowed by the M-BUS standard are 300, 600, 2400, 4800, 9600, 19200 and 38400 baud, all of which are supported by the NCN5150.

Bus Connection and Rectification

The bus should be connected to the pins BUSL1 and BUSL2 through series resistors to limit the current drawn from the bus in case of failure (according to the M-BUS standard). Typically, two 220 Ω resistors are used for this purpose.

Since the M-BUS connection is polarity independent, the NCN5150 will first rectify the bus voltage through an active diode bridge.

Slave Power Supply (Bus Powered)

A slave device can be powered by the M-BUS or from an external supply. The M-BUS standard requires the slave to draw a fixed current from the bus. This is accomplished by the constant current source CS1. This current is used to charge the external storage capacitor C_{STC}. The current drawn from the bus is defined by the programming resistor R_{IDD}. The bus current can be chosen in increments of 1.5 mA called unit loads. Table 5 list the different values of programming resistors needed for different unit loads, as well as the current drawn from the bus (I_{BUS}) and the current that can be drawn from the STC pin (I_{STC}). I_{STC} is slightly less than I_{BUS} to account for the internal power consumption of the NCN5150. The R_{IDD} resistor used must be at least 1%

accurate. Note that using 5 and 6 Unit Loads is not covered by the M-BUS standard.

When the voltage on the STC pin reaches V_{STC} , VDD ON the LDO is turned on, and will regulate the voltage on the VDD pin to 3.3 V, drawing current from the storage capacitor. A decoupling capacitor of minimum 1 μ F is required on the VDD pin for stability of the regulator. On the STC pin, a minimum capacitance of 10 μ F is required. Furthermore, the ratio C_{STC}/C_{VDD} must be larger than 9. The voltage on the STC pin is clamped to $V_{STC, clamp}$ by a shunt regulator, which will dissipate any excess current that is not used by the NCN5150 or external circuits.

Slave Power Supply (External)

In case the external sensor circuit consumes more than the allowed bus current or the sensor should be kept operational when the bus is not present, an external power supply, such as a battery, is required.

When the external circuitry uses different logical voltage levels, simply connect the power supply of that voltage level to V_{IO} , so that the RX, RXI, TX, TXI and Pfb pins will respond to the correct voltage levels. The NCN5150 will still be powered from the bus, but all communication will be translated to the voltage level of V_{IO} .

If the external power supply should be used only as a backup when the bus power supply fails, a PMOS transistor can be inserted between the external power supply and VDD as shown in Figure 5. The gate is connected to VS, and will be driven high when the voltage on STC goes above the turn-on threshold of the LDO, nl. V_{STC} , VDD ON. For more information see the paragraph on the power on sequence and corresponding Figure 12 on page 10.

Communication, Master to Slave

M-BUS communication from master to slave is based on voltage level signaling. To differentiate between master signaling and voltage drop caused by the signaling of another slave over cabling resistance, etc., the mark level $V_{BUS, MARK}$ is stored, and only when the bus voltage drops to less than V_T will the NCN5150 detect communication. A simplified schematic of the receiver is shown in Figure 8. The received data is transmitted on the pins TX and TXI, as shown in the waveforms of Figure 7.

An external capacitor must be connected to the SC pin to store the mark voltage level. This capacitor is charged to V_B . Discharging of this capacitor is typically 40x slower, so that the voltage on SC drops only a little during the time the master is transmitting a space. The value of C_{SC} must be chosen in the range of 100 nF–330 nF.

Figure 7. Communication, Master to Slave

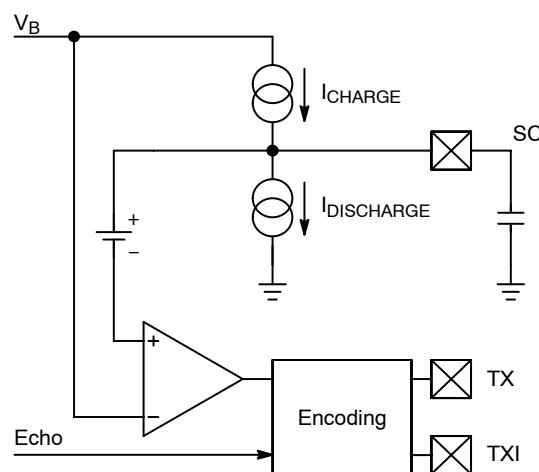

Figure 8. Communication, Master to Slave

Communication, Slave to Master

M-BUS communication from slave to master uses bus current modulation while the voltage remains constant. This current modulation can be controlled from either the RX or RXI pin as shown in Figure 10. When transmitting a space ("0"), the current modulator will draw an additional current from the bus. This current can be set with a programming resistor R_{RIS} . To achieve the space current required the M-BUS standard, R_{RIS} should be 100 Ω . A simplified schematic of the transmitter is shown in Figure 11.

Figure 9. Typical Relationship between RIS and Current Modulation Level

Because the M-BUS protocol is specified as half-duplex, an echo function will cause the transmitted signal on RX or RXI to appear on the receiver outputs TX and TXI. Should the master attempt to send at the same time, the bitwise added signal of both sources will appear on these pins, resulting in invalid data.

Figure 10. Communication, Slave to Master

Figure 11. Communication, Slave to Master

Power On/Off Sequence

The power-on and power-off sequence of the NCN5150 is shown in Figure 12. Shown also in Figure 12 is the operation of the PFb pin. This pin is used to give an early warning to the microcontroller that the bus power is collapsing, allowing the microcontroller to save its data and

shut down gracefully. The times t_{on} and t_{off} can be approximated by the following formulas:

$$t_{on} = \frac{C_{STC}}{I_{STC}} V_{STC, VDD ON} \quad (\text{eq. 1})$$

$$t_{off} = \frac{C_{STC}}{I_{CC} + I_{DD}} (V_{STC, Clamp} - V_{STC, VDD OFF}) \quad (\text{eq. 2})$$

Where I_{CC} is the internal current consumption of the NCN5150 and I_{DD} is the current consumed by external circuits drawn from either VDD or STC.

These formulas can be used to dimension the value of the bulk C_{STC} needed, taking into account that the M-BUS standard requires t_{on} to be less than 3 s.

For certain applications where the power drawn from the bus is not used in external circuits, the storage capacitor value can be much lower. The NCN5150 requires a minimum STC capacitance of 10 μF to ensure that the bus current regulation is stable under all conditions.

Figure 12. Power-on and Power-off

Thermal Shutdown

The NCN5150 includes a thermal shutdown function that will disable the transmitter when the junction temperature of the IC becomes too hot. The thermal protection is only active when the slave is transmitting a space to the master.

A listing of SCILLC's product/patent coverage may be accessed at www.onsemi.com/site/pdf/Patent-Marketing.pdf. SCILLC reserves the right to make changes without further notice to any products herein. SCILLC makes no warranty, representation or guarantee regarding the suitability of its products for any particular purpose, nor does SCILLC assume any liability arising out of the application or use of any product or circuit, and specifically disclaims any and all liability, including without limitation special, consequential or incidental damages. "Typical" parameters which may be provided in SCILLC data sheets and/or specifications can and do vary in different applications and actual performance may vary over time. All operating parameters, including "Typicals" must be validated for each customer application by customer's technical experts. SCILLC does not convey any license under its patent rights nor the rights of others. SCILLC products are not designed, intended, or authorized for use as components in systems intended for surgical implant into the body, or other applications intended to support or sustain life, or for any other application in which the failure of the SCILLC product could create a situation where personal injury or death may occur. Should Buyer purchase or use SCILLC products for any such unintended or unauthorized application, Buyer shall indemnify and hold SCILLC and its officers, employees, subsidiaries, affiliates, and distributors harmless against all claims, costs, damages, and expenses, and reasonable attorney fees arising out of, directly or indirectly, any claim of personal injury or death associated with such unintended or unauthorized use, even if such claim alleges that SCILLC was negligent regarding the design or manufacture of the part. Компания «Life Electronics» занимается поставками электронных компонентов импортного и отечественного производства от производителей и со складов крупных дистрибьюторов Европы, Америки и Азии.

С конца 2013 года компания активно расширяет линейку поставок компонентов по направлению коаксиальный кабель, кварцевые генераторы и конденсаторы (керамические, пленочные, электролитические), за счёт заключения дистрибьюторских договоров

Мы предлагаем:

- Конкурентоспособные цены и скидки постоянным клиентам.
- Специальные условия для постоянных клиентов.
- Подбор аналогов.
- Поставку компонентов в любых объемах, удовлетворяющих вашим потребностям.
- Приемлемые сроки поставки, возможна ускоренная поставка.
- Доставку товара в любую точку России и стран СНГ.
- Комплексную поставку.
- Работу по проектам и поставку образцов.
- Формирование склада под заказчика.
- Сертификаты соответствия на поставляемую продукцию (по желанию клиента).
- Тестирование поставляемой продукции.
- Поставку компонентов, требующих военную и космическую приемку.
- Входной контроль качества.
- Наличие сертификата ISO.

В составе нашей компании организован Конструкторский отдел, призванный помогать разработчикам, и инженерам.

Конструкторский отдел помогает осуществить:

- Регистрацию проекта у производителя компонентов.
- Техническую поддержку проекта.
- Защиту от снятия компонента с производства.
- Оценку стоимости проекта по компонентам.
- Изготовление тестовой платы монтаж и пусконаладочные работы.
