GENERAL DESCRIPTION

The [ADR225](#) is a precision 2.5 V band gap voltage reference specified for a high temperature operation of 175°C and 210°C. It uses a micropower core topology and laser trimming of highly stable, thin film resistors to achieve a temperature coefficient of 30 ppm/°C (maximum) up to 175°C and an initial accuracy of 0.4% (±10 mV maximum). A maximum operating current of 50 µA and a low dropout voltage allow the [ADR225](#) to function very well in battery-powered equipment.

The [ADR225](#) voltage reference is offered in an 8-lead SOIC package with an operating temperature range of –40°C to +175°C.

PIN CONFIGURATION

It is also available in an 8-lead ceramic flat pack (FLATPACK) with an operating temperature range of –40°C to +210°C. Both devices are designed for robustness at extreme temperatures and are qualified for 1000 hours of operation at the maximum temperature rating.

The [ADR225](#) is a member of a growing series of high temperature qualified products offered by Analog Devices, Inc. For a complete selection table of the available high temperature products, see the high temperature product list and qualification data available at www.analog.com/hightemp.

¹ For proper operation, a 1 μF capacitor is required between the OUTPUT pin and the GND pin of the device.

² TCV_{OUT} is defined as the ratio of output change with temperature variation to the specified temperature range expressed in ppm/°C.

$$TCV_{OUT} = (V_{MAX} - V_{MIN}) / V_{OUT}(T_{MAX} - T_{MIN})$$

³ Load regulation specification includes the effect of self-heating.

Stresses above those listed under Absolute Maximum Ratings may cause permanent damage to the device. This is a stress rating only; functional operation of the device at these or any other conditions above those indicated in the operational section of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

PREDICTED LIFETIME vs. OPERATING TEMPERATURE

Comprehensive reliability testing is performed on the [ADR225](#). Product lifetimes at extended operating temperature are obtained using high temperature operating life (HTOL). Lifetimes are predicted from the Arrhenius equation, taking into account potential design and manufacturing failure mechanism assumptions. HTOL is performed to JEDEC JESD22-A108. A minimum of three wafer fab and assembly lots are processed through HTOL at the maximum operating temperature. Comprehensive reliability testing is performed on all Analog Devices, Inc., high temperature (HT) products.

THERMAL RESISTANCE

θ_{JA} is specified for worst-case conditions; that is, θ_{JA} is specified for the device soldered in the circuit board.

ESD CAUTION

ESD (electrostatic discharge) sensitive device. Charged devices and circuit boards can discharge without detection. Although this product features patented or proprietary protection circuitry, damage may occur on devices subjected to high energy ESD. Therefore, proper ESD precautions should be taken to avoid performance degradation or loss of functionality.

THEORY OF OPERATION

BASIC VOLTAGE REFERENCE CONNECTIONS

The circuit shown in Figure 24 is the basic configuration for the [ADR225](#). Note that a 10 μF and 0.1 μF bypass network on the input and at least a 1 μF bypass capacitor on the output are required for proper device operation. It is recommended that no connections be made to Pin 1, Pin 3, Pin 5, Pin 7, and Pin 8.
