## 1. Overview

Advantech SQFlash 640 series 2.5" SSD (SQF-S25 640) delivers all the advantages of flash disk technology with the Serial ATA I/II/III interface and is fully compliant with MO-300 2.5" SSD specification. The SQF-S25 640 is designed to operate at a maximum operating frequency of 200MHz with 30MHz external crystal. Its capacity could provide a wide range up to 1TB. Moreover, it can reach up to 550MB/s read as well as 500MB/s write high performance based on Toggle 2.0 MLC flash (with 32MB SDR enabled and measured by CrystalDiskMark v5.0). The power consumption of SQF-S25 640 is much lower than traditional hard drives, making it the best embedded solution for new platforms.

## **2. Features**

### **■ Standard SATA interface**

- Support SATA 1.5/3.0/6.0 Gbps interface
- SATA Revision 3.2 compliant

### **■ Operating Voltage : 5V**

### **■ TRIM 、 AHCI supported**

### **■ Temperature Ranges**

- Commercial Temperature
  - 0℃ to 70℃ for operating
  - -40℃ to 85℃ for storage
- Industrial Temperature
  - -40℃ to 85℃ for operating
  - -40℃ to 85℃ for storage

### **■ Mechanical Specification**

- Shock : 1,500G / 0.5ms
- Vibration : 20G / 80~2,000Hz

### **■ Humidity**

- Humidity : 5% ~ 95% under 55℃

### **■ Endurance : > 2,000,000 program/erase cycles**

- This is a test result of the whole SQFlash drive. The test is to keep writing a fixed logical block address (LBA) and see if any bad blocks occur after 2M cycles. With wear-levelling mechanism, although the disk was kept writing the same LBA but the physical block changes per block writing. So this test also proves that wear-leveling is really working, or the block would be wearout after its designated life cycles.

### **■ Data Retention**

- 10 years

### **■ Acquired RoHS 、 WHQL 、 CE 、 FCC Certificate**

### **■ Acoustic : 0 dB**

### **■ Dimension : 100 mm x 69.85 mm x 7 mm**

### 3. Specification Table

#### ■ Performance

|                    |             | Sequential Performance<br>(MB/sec) |        | Random Performance<br>(IOPS@4K) |        |
|--------------------|-------------|------------------------------------|--------|---------------------------------|--------|
|                    |             | Read                               | Write  | Read                            | Write  |
| SLC                | 8 GB        | TBD                                | TBD    | TBD                             | TBD    |

|                    | 64 GB (2CH) | 561.47                             | 327.99 | 57,479                          | 76,938 |
|                    | 64 GB (4CH) | 561.26                             | 320.65 | 58,039                          | 76,129 |
|                    | 128 GB      | 561.74                             | 472.90 | 83,158                          | 83,325 |
|                    | 256 GB      | 561.73                             | 497.89 | 89,244                          | 86,529 |
|                    | 512 GB      | 561.70                             | 498.93 | 84,376                          | 85,891 |
|                    | 1 TB        | 534.47                             | 464.68 | 83,378                          | 86,234 |
| 3D NAND<br>(BiCS3) | 64 GB       | 554.55                             | 260.29 | 35,010                          | 61,265 |
|                    | 128 GB      | 560.93                             | 457.84 | 62,272                          | 82,456 |
|                    | 256 GB      | 561.39                             | 504.12 | 79,278                          | 84,558 |
|                    | 512 GB      | 561.75                             | 543.13 | 77,126                          | 85,351 |
|                    | 1 TB        | 543.25                             | 504.63 | 77,208                          | 88,416 |

\* All performance above are tested with AHCI mode.

\* Tested by CrystalDiskMark 1GB workload.

### ■ Endurance

JEDEC defined an endurance rating TBW (TeraByte Written), following by the equation below, for indicating the number of terabytes a SSD can be written which is a measurement of SSDs' expected lifespan, represents the amount of data written to the device.

$$\text{TBW} = [(\text{NAND Endurance}) \times (\text{SSD Capacity})] / \text{WAF}$$

- **NAND Endurance:** Program / Erase cycle of a NAND flash.
  - SLC: 100,000 cycles
  - Ultra MLC: 30,000 cycles
  - MLC: 3,000 cycles
  - 3D NAND (BiCS3): 3,000 cycles
- **SSD Capacity:** SSD physical capacity in total of a SSD.
- **WAF:** Write Amplification Factor (WAF), as the equation shown below, is a numerical value representing the ratio between the amount of data that a SSD controller needs to write and the amount of data that the host's flash controller writes. A better WAF, which is near to 1, guarantees better endurance and lower frequency of data written to flash memory.

$$\text{WAF} = (\text{Lifetime write to flash}) / (\text{Lifetime write to host})$$

Endurance measurement is based on New JEDEC 219 Client Workload and verified with following workload conditions,

- Test duration: over 168hrs (=7 days)
- File Size: Follow by JEDEC 219

#### • SQFlash 640 2.5" SSD TBW (SLC/ UltraMLC/ MLC)

|        | WAF  | TBW  |           |      |
|--------|------|------|-----------|------|
|        |      | SLC  | Ultra MLC | MLC  |
| 8 GB   | TBD  | TBD  | TBD       | TBD  |
| 16 GB* | 5.97 | TBD  | 53        | 8    |
| 32 GB* | 3.84 | 1485 | 450       | 25   |
| 64 GB  | 2.74 | 2970 | 900       | 70   |
| 128 GB | 2.89 | --   | 1810      | 133  |
| 256 GB | 2.40 | --   | 2620      | 320  |
| 512 GB | 2.17 | --   | 5440      | 709  |
| 1 TB   | 2.09 | --   | --        | 1470 |

#### • SQFlash 640 2.5" SSD TBW (3D NAND (BiCS3))

|        | WAF  | TBW             |
|--------|------|-----------------|
|        |      | 3D NAND (BiCS3) |
| 32 GB  | TBD  | TBD             |
| 64 GB  | 2.61 | 74              |
| 128 GB | 2.93 | 131             |
| 256 GB | 2.44 | 315             |
| 512 GB | 2.07 | 744             |
| 1 TB   | 2.10 | 1461            |

- The endurance of SSD could be estimated based on users' behaviors, NAND endurance cycles, and write amplification factor. It is not guaranteed by the flash vendor.
- TBW may vary from flash configuration and platform
- "\*" By Simulation

## 4. General Description

### ■ Error Correction Code (ECC)

Flash memory cells will deteriorate with use, which might generate random bit errors in the stored data. Thus, SQFlash 640 series 2.5" SSD applies the LDPC (Low Density Parity Check) of ECC algorithm, which can detect and correct errors occur during read process, ensure data been read correctly, as well as protect data from corruption.

### ■ Wear Leveling

NAND flash devices can only undergo a limited number of program/erase cycles, and in most cases, the flash media are not used evenly. If some areas get updated more frequently than others, the lifetime of the device would be reduced significantly. Thus, Wear Leveling is applied to extend the lifespan of NAND Flash by evenly distributing write and erase cycles across the media.

SQFlash provides advanced Wear Leveling algorithm, which can efficiently spread out the flash usage through the whole flash media area. Moreover, by implementing both dynamic and static Wear Leveling algorithms, the life expectancy of the NAND flash is greatly improved.

### ■ Bad Block Management

Bad blocks are blocks that include one or more invalid bits, and their reliability is not guaranteed. Blocks that are identified and marked as bad by the manufacturer are referred to as "Initial Bad Blocks". Bad blocks that are developed during the lifespan of the flash are named "Later Bad Blocks". SQFlash implements an efficient bad block management algorithm to detect the factory-produced bad blocks and manages any bad blocks that appear with use. This practice further prevents data being stored into bad blocks and improves the data reliability.

### ■ Power Loss Protection: Flush Manager

Power Loss Protection is a mechanism to prevent data loss during unexpected power failure. DRAM is a volatile memory and frequently used as temporary cache or buffer between the controller and the NAND flash to improve the SSD performance. However, one major concern of the DRAM is that it is not able to keep data during power failure. Accordingly, SQFlash SSD applies the Flush Manager technology, only when the data is fully committed to the NAND flash will the controller send acknowledgement (ACK) to the host. Such implementation can prevent false-positive performance and the risk of power cycling issues.

In addition, it is critical for a controller to shorten the time the in-flight data stays in the controller internal cache. Thus, SQFlash applies an algorithm to reduce the amount of data resides in the cache to provide a better performance. With Flush Manager, incoming data would only have a "pit stop" in the cache and then move to NAND flash directly. Also, the onboard DDR will be treated as an "organizer" to consolidate incoming data into groups before written into the flash to improve write amplification.

### ■ TRIM

TRIM is a feature which helps improve the read/write performance and speed of solid-state drives (SSD). Unlike hard disk drives (HDD), SSDs are not able to overwrite existing data, so the available space gradually becomes smaller with each use. With the TRIM command, the operating system can inform the SSD which blocks of data are no longer in use and can be removed permanently. Thus, the SSD will perform the erase action, which prevents unused data from occupying blocks all the time.

### ■ SMART

SMART, an acronym for Self-Monitoring, Analysis and Reporting Technology, is an open standard that allows a hard disk drive to automatically detect its health and report potential failures. When a failure is recorded by SMART, users can choose to replace the drive to prevent unexpected outage or data loss. Moreover, SMART can inform users of impending failures while there is still time to perform proactive actions, such as copy data to another device.

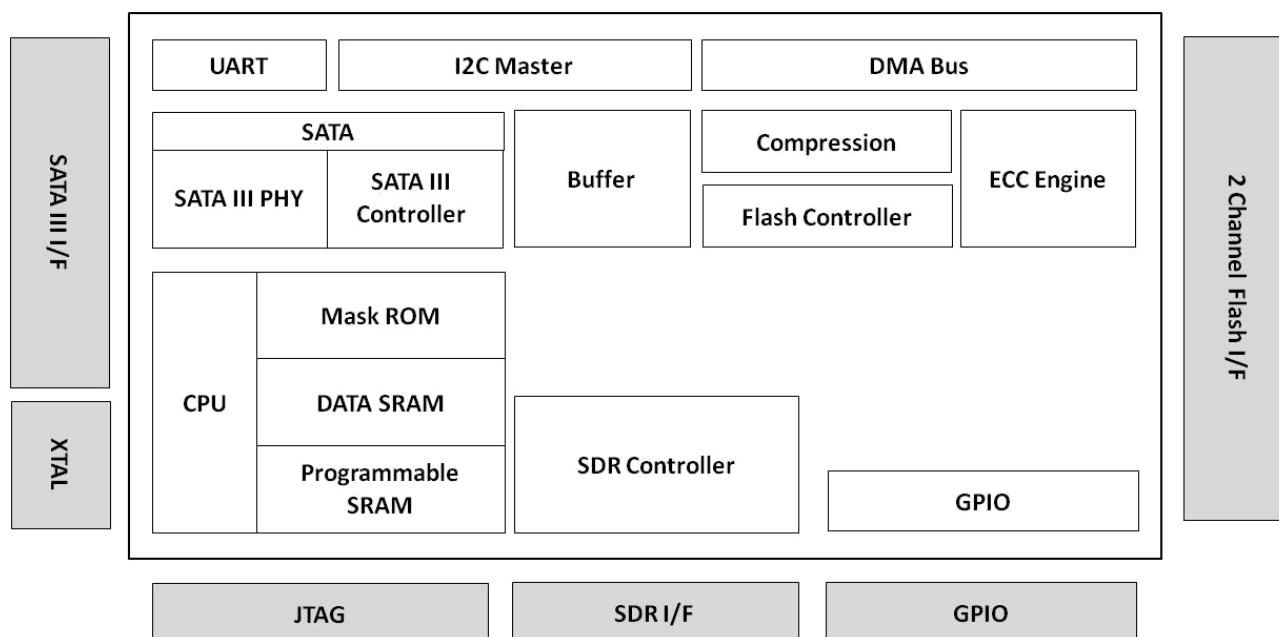

## ■ Over-Provision

Over Provisioning refers to the inclusion of extra NAND capacity in a SSD, which is not visible and cannot be used by users. With Over Provisioning, the performance and IOPS (Input/Output Operations per Second) are improved by providing the controller additional space to manage P/E cycles, which enhances the reliability and endurance as well. Moreover, the write amplification of the SSD becomes lower when the controller writes data to the flash.

## ■ Thermal Throttling

Thermal Throttling function is for protecting the drive and reducing the possibility of read / write error due to overheat. The temperature is monitored by the thermal sensor. As the operating temperature continues to increase to threshold temperature, the Thermal Throttling mechanism is activated. At this time, the performance of the drive will be significantly decreased to avoid continuous heating. When the operating temperature falls below threshold temperature, the drive can resume to normal operation.

## ■ Block Diagram

## ■ LBA value

| Density | LBA           |
|---------|---------------|
| 8 GB    | 15,649,200    |
| 16 GB   | 31,277,232    |
| 32 GB   | 62,533,296    |
| 64 GB   | 125,045,424   |
| 128 GB  | 250,069,680   |
| 256 GB  | 500,118,192   |
| 512 GB  | 1,000,215,216 |
| 1 TB    | 2,000,409,264 |

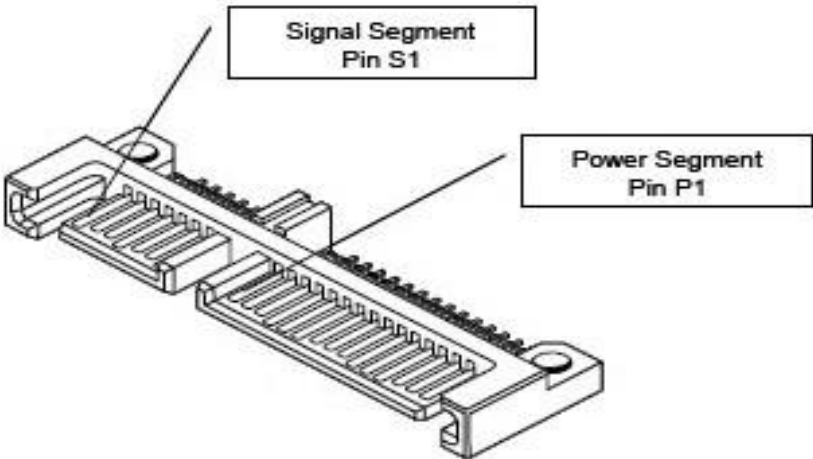

5. Pin Assignment and Description

5.1 2.5" SATA-SSD Interface Pin Assignments (Signal Segment)

| Pin # | Function | Description                |
|-------|----------|----------------------------|
| S1    | GND      | 2 <sup>nd</sup> mate       |
| S2    | A+       | Differential signal pair A |
| S3    | A-       |                            |
| S4    | GND      | 2 <sup>nd</sup> mate       |
| S5    | B-       | Differential signal pair B |
| S6    | B+       |                            |
| S7    | GND      | 2 <sup>nd</sup> mate       |

5.2 2.5" SATA-SSD Interface Pin Assignments (Power Segment)

| Pin # | Function                   |
|-------|----------------------------|
| P1    | Not Used (3.3V)            |
| P2    | Not Used (3.3V)            |
| P3    | Not Used (3.3V Pre-Charge) |
| P4    | GND                        |
| P5    | GND                        |
| P6    | GND                        |
| P7    | 5V Pre-Charge              |
| P8    | 5V                         |
| P9    | 5V                         |
| P10   | GND                        |
| P11   | LED pin                    |
| P12   | GND                        |
| P13   | Not Used (12V Pre-Charge)  |
| P14   | Not Used (12V)             |

## 6. Identify Device Data

The Identify Device Data enables Host to receive parameter information from the device. The parameter words in the buffer have the arrangement and meanings defined in below table. All reserve bits or words are zero

| Word  | ATA Identify Parameter  | Value             |
|-------|---|-------------------|
| 0     | General configuration bit-significant information                             | 0040h             |
| 1     | Obsolete  | *1                |
| 2     | Specific configuration  | C837h             |
| 3     | Obsolete  | 0010h             |
| 4-5   | Retired   | 00000000h         |
| 6     | Obsolete  | 003Fh             |
| 7-8   | Reserved for assignment by the Compact Flash Association                      | 00000000h         |
| 9     | Retired   | 0000h             |
| 10-19 | Serial number (20 ASCII characters)   | Varies            |
| 20-21 | Retired   | 00000000h         |
| 22    | Obsolete  | 0000h             |
| 23-26 | Firmware revision (8 ASCII characters)  | Varies            |
| 27-46 | Model number (xxxxxxx)  | Varies            |
| 47    | 7:0- Maximum number of sectors transferred per interrupt on MULTIPLE commands | 8010h             |
| 48    | Trusted Computing feature set options(not support)                            | 4000h             |
| 49    | Capabilities  | 2F00h             |
| 50    | Capabilities  | 4000h             |
| 51-52 | Obsolete  | 00000000h         |
| 53    | Words 88 and 70:64 valid  | 0007h             |
| 54    | Obsolete  | *1                |
| 55    | Obsolete  | 0010h             |
| 56    | Obsolete  | 003Fh             |
| 57-58 | Obsolete  | *2                |
| 59    | Sanitize and Number of sectors transferred per interrupt on MULTIPLE commands | 5D10h             |
| 60-61 | Maximum number of sector ( 28bit LBA mode)                                    | *3                |
| 62    | Obsolete  | 0000h             |
| 63    | Multi-word DMA modes supported/selected                                       | 0407h             |
| 64    | PIO modes supported   | 0003h             |
| 65    | Minimum Multiword DMA transfer cycle time per word                            | 0078h             |
| 66    | Manufacturer's recommended Multiword DMA transfer cycle time                  | 0078h             |
| 67    | Minimum PIO transfer cycle time without flow control                          | 0078h             |
| 68    | Minimum PIO transfer cycle time with IORDY flow control                       | 0078h             |
| 69    | Additional Supported (support download microcode DMA)                         | 0D00h             |
| 70    | Reserved  | 0000h             |
| 71-74 | Reserved for the IDENTIFY PACKET DEVICE command                               | 0000000000000000h |
| 75    | Queue depth   | 001Fh             |

| 3Fh     | Write Long EXT                       | E3h     | Idle                         |
| 40h     | Read Verify Sectors                  | E4h     | Read Buffer                  |
| 41h     | Read Verify Sectors without Retry    | E5h     | Check Power Mode             |
| 42h     | Read Verify Sectors EXT              | E6h     | Sleep                        |
| 44h     | Zero EXT                             | E7h     | Flush Cache                  |
| 45h     | Write Uncorrectable EXT              | E8h     | Write Buffer                 |
| 47h     | Read Log DMA EXT                     | EAh     | Flush Cache EXT              |
| 57h     | Write Log DMA EXT                    | ECh     | Identify Device              |
| 60h     | Read FPDMA Queued                    | EFh     | Set Features                 |
| 61h     | Write FPDMA Queued                   | F1h     | Security Set Password        |
| 70h-76h | Seek                                 | F2h     | Security Unlock              |
| 77h     | Set Date & Time EXT                  | F3h     | Security Erase Prepare       |
| 78h     | Accessible Max Address configuration | F4h     | Security Erase Unit          |
| 79h-7Fh | Seek                                 | F5h     | Security Freeze Lock         |
| 90h     | Execute Device Diagnostic            | F6h     | Security Disable Password    |

Note: ND = Non-Data Command  
 PI = PIO Data-In Command  
 PO = PIO Data-Out Command  
 DM = DMA Command  
 DD = Execute Diagnostic Command

**[Command Set Descriptions]****1. CHECK POWER MODE (code: E5h);**

This command allow host to determine the current power mode of the device.

**2. DOWNLOAD MICROCODE (code: 92h);**

This command enable the host to alter the device's microcode. The data transferred using the DOWNLOAD MICROCODE command is vendor specific.

All transfers shall be an integer multiple of the sector size. The size of the data transfer is determined by the content of the LBA Low register and the Sector Count register.

This allows transfer sizes from 0 bytes to 33,553,920 bytes, in 512bytes increments.

**3. EXECUTE DEVICE DIAGNOSTIC (code: 90h);**

This command performs the internal diagnostic tests implemented by the module.

**4. FLUSH CACHE (code: E7h);**

This command used by the host to request the device to flush the write cache.

**5. FLUSH CACHE EXT (code: EAh);**

This command is used by the host to request the device to flush the write cache. If there is data in the write cache, that data shall be written to the media.

**6. IDENTIFY DEVICE (code: ECh);**

The IDENTIFY DEVICE command enables the host to receive parameter information from the module.

**7. IDLE (code: 97h or E3h);**

This command allows the host to place the module in the IDLE mode and also set the Standby timer. INTRQ may be asserted even through the module may not have fully transitioned to IDLE mode. If the Sector Count register is non-"0", then the Standby timer shall be enabled. The value in the Sector Count register shall be used to determine the time programmed into the Standby timer. If the Sector Count register is "0" then the Standby timer is disabled.

**8. IDLE IMMEDIATE (code: E1h);**

This command causes the module to set BSY, enter the Idle (Read) mode, clear BSY and generate an interrupt.

**9. INITIALIZE DEVICE PARAMETERS (code: 91h);**

This command enables the host to set the number of sectors per track and the number of heads per cylinder.

**10. NOP (code: 00h);**

If this command is issued, the module respond with command aborted.

**11. READ BUFFER (code: E4h);**

This command enables the host to read the current contents of the module's sector buffer.

**12. READ DMA (code: C8h or C9h);**

This command reads from "1" to "256" sectors as specified in the Sector Count register using the DMA data transfer protocol. A sector count of "0" requests "256" sectors transfer. The transfer begins at the sector specified in the Sector Number register.

**13. READ DMA Ext (code: 25h);**

This command allows the host to read data using the DMA data transfer protocol.

**14. READ MULTIPLE (code: C4h);**

This command performs similarly to the READ SECTORS command. Interrupts are not generated on each sector, but on the transfer of a block which contains the number of sector per block is defined by the content of word 59 in the IDENTIFY DEVICE response.

**15. READ MULTIPLE EXT (code: 29h);**

This command performs similarly to the READ SECTORS command. The number of sectors per block is defined by a successful SET MULTIPLE command. If no successful SET MULTIPLE command has been issued, the block is defined by the device's default value for number of sectors per block as defined in bits (7:0) in word 47 in the IDENTIFY DEVICE information.

**16. READ NATIVE MAX ADDRESS (code: F8h);**

This command returns the native maximum address. The native maximum address is the highest address accepted by the device in the factory default condition.

**17. READ NATIVE MAX ADDRESS EXT (code: 27h);**

This command returns the native maximum address.

**18. READ SECTOR(S) (code: 20h or 21h);**

This command reads from "1" to "256" sectors as specified in the Sector Count register. A sector count of "0" requests "256" sectors transfer. The transfer begins at the sector specified in the Sector Number register.

**19. READ SECTOR(S) EXT (code: 24h);**

This command reads from "1" to "65536" sectors as specified in the Sector Count register. A sector count of "0" requests "65536" sectors transfer. The transfer begins at the sector specified in the Sector Number register.

**20. READ VERIFY SECTOR(S) (code: 40h or 41h);**

This command is identical to the READ SECTORS command, except that DRQ is never set and no data is transferred to the host.

**21. READ VERIFY SECTOR(S) EXT (code: 42h);**

This command is identical to the READ SECTORS command, except that DRQ is never set and no data is transferred to the host.

**22. RECALIBRATE (code: 1Xh);**

This command return value is select address mode by the host request.

**23. SECURITY DISABLE PASSWORD (code: F6h);**

This command transfers 512 bytes of data from the host. Table defines the content of this information. If the password selected by word 0 match the password previously saved by the device, the device shall disable the Lock mode. This command shall not change the Master password. The Master password shall be reactivated when a User password is set.

**24. SECURITY ERASE PREPARE (code: F3h);**

This command shall be issued immediately before the SECURITY ERASE UNIT command to enable device erasing and unlocking.

**25. SECURITY ERASE UNIT (code: F4h);**

This command transfer 512 bytes of data from the host. Table## defines the content of this information. If the password does not match the password previously saved by the device, the device shall reject the command with command aborted.

The SECURITY ERASE PREPARE command shall be completed immediately prior to the SECURITY

ERASE UNIT command.

**26. SECURITY FREEZE LOCK (code: F5h);**

This command shall set the device to frozen mode. After command completion any other commands that update the device Lock mode shall be command aborted. Frozen shall be disabled by power-off or hardware reset.

If SECURITY FREEZE LOCK is issued when the drive is in frozen mode, the drive executes the command and remains in frozen mode.

**27. SECURITY SET PASSWORD (code: F1h);**

This command transfer 512 bytes of data from the host. Table defines the content of this information. The data transferred controls the function of this command. Table defines the interaction of the identifier and security level bits.

**28. SECURITY UNLOCK (code: F2h);**

This command transfer 512 bytes of data from the host. Table (as Disable Password) defines the content of this information.

If the Identifier bit is set to Master and the device is in high security level, then the password supplied shall be compared with the stored Master password. If the device is in maximum security level then the unlock shall be rejected.

If the identifier bit is set to user then the device shall compare the supplied password with the stored User password.

If the password compare fails then the device shall return command aborted to the host and decrements the unlock counter. This counter shall be initially set to five and shall be decremented for each password mismatch when SECURITY UNLOCK is issued and the device is locked. When this counter reaches zero then SECURITY UNLOCK and SECURITY ERASE UNIT command shall be aborted until a power-on or a hardware reset.

**29. SEEK (code: 7Xh);**

This command performs address range check.

**30. SET MAX ADDRESS (code: F9h);**

After successful command completion, all read and write access attempts to address greater than specified by the successful SET MAX ADDRESS command shall be rejected with an IDNF error.

IDENTIFY DEVICE response words (61:60) shall reflect the maximum address set with this command.

**31. SET MAX ADDRESS EXT (code: 37h);**

After successful command completion, all read and write access attempts to address greater than specified by the successful SET MAX ADDRESS command shall be rejected with an IDNF error.

IDENTIFY DEVICE response words (61:60) shall reflect the maximum address set with this command.

**32. SET FEATURE (code: EFh);**

This command is used by the host to establish parameters that affect the execution of certain device features.

**33. SET MULTIPLE MODE (code: C6h);**

This command enables the device to perform READ and Write Multiple operations and establishes the block count for these commands.

**34. SLEEP (code: 99h or E6h);**

This command causes the module to set BSY, enter the Sleep mode, clear BSY and generate an interrupt.

**35. SMART READ DATA (code: B0h with Feature register value of D0h);**

This command returns the Device SMART data structure to the host.

### 36. SMART ENABLE/DISABLE AUTO SAVE (code: B0h with Feature register value of D2h);

This command enables and disables the optional attribute autosave feature of the device.

### 37. SMART EXECUTE OFF\_LINE (code: B0h with Feature register value of D4h);

This command cause the device to immediately initiate the optional set of activities that collect SMART data in an off-line mode and then save this data to the device's non-volatile memory, or execute a self-diagnostic test routine in either captive or off-line mode.

### 38. SMART READ LOG (code: B0h with Feature register value of D5h);

This command returns the specified log data to the host.

### 39. SMART ENABLE OPERATION (code: B0h with Feature register value of D8h);

This command enables access to all SMART capabilities within the device. Prior to receipt of this command SMART data are neither monitored nor saved by the device.

### 40. SMART DISABLE OPERATION (code: B0h with Feature register value of D9h);

This command disables all SMART capabilities within the device including any and all timer and event count functions related exclusively to this feature. After command acceptance the device shall disable all SMART operations.

After receipt of this command by the device, all other SMART commands including SMART DISABLE OPERATION commands, with exception of SMART ENABLE OPERATIONS, are disabled and invalid and shall be command aborted by the device.

### 41. SMART RETURN STATUS (code: B0h with Feature register value of DAh);

This command causes the device to communicate the reliability status of the device to the host.

### 42. STANDBY (code: E2h);

This command causes the module to set BSY, enter the Standby mode, clear BSY and return the interrupt immediately.

### 43. STANDBY IMMEDIATE (code: E0h);

This command causes the module to set BSY, enter the Standby mode, clear BSY and return the interrupt immediately.

### 44. WRITE BUFFER (code: E8h);

This command enables the host to overwrite contents of the module's sector buffer with any data pattern desired.

### 45. WRITR DMA (code: CAh or CBh);

This command writes from "1" to "256" sectors as specified in the Sector Count register using the DMA data transfer protocol. A sector count of "0" requests "256" sectors transfer. The transfer begins at the sector specified in the Sector Number register.

### 46. WRITR DMA EXT (code: 35h);

This command writes from "1" to "65536" sectors as specified in the Sector Count register using the DMA data transfer protocol. A sector count of "0" requests "65536" sectors transfer. The transfer begins at the sector specified in the Sector Number register.

### 47. WRITE MULTIPLE (code: C5h);

This command is similar to the WRITE SECTORS command. Interrupts are not presented on each sector, but on the transfer of a block which contains the number of sectors defined by Set Multiple command.

### 48. WRITE MULTIPLE EXT (code: 39h);

This command is similar to the WRITE SECTORS command. Interrupts are not presented on each sector, but on the transfer of a block which contains the number of sectors defined by Set Multiple command.

**49. WRITE SECTOR(S) (code: 30h);**

This command writes from "1" to "256" sectors as specified in the Sector Count register. A sector count of "0" requests "256" sectors transfer. The transfer begins at the sector specified in the Sector Number register.

**50. WRITE SECTOR(S) EXT (code: 34h);**

This command writes from "1" to "65536" sectors as specified in the Sector Count register. A sector count of "0" requests "65536" sectors transfer. The transfer begins at the sector specified in the Sector Number register.

**51. WRITE SECTOR(S) W/O ERASE (code: 38h);**

This command writes from "1" to "256" sectors as specified in the Sector Count register. A sector count of "0" requests "256" sectors transfer. The transfer begins at the sector specified in the Sector Number register.

**52. WRITE VERIFY (code: 3Ch);**

This command is similar to the WRITE SECTOR(S) command, except that each sector is verified before the command is completed.

## 8. System Power Consumption

### 8.1 Supply Voltage

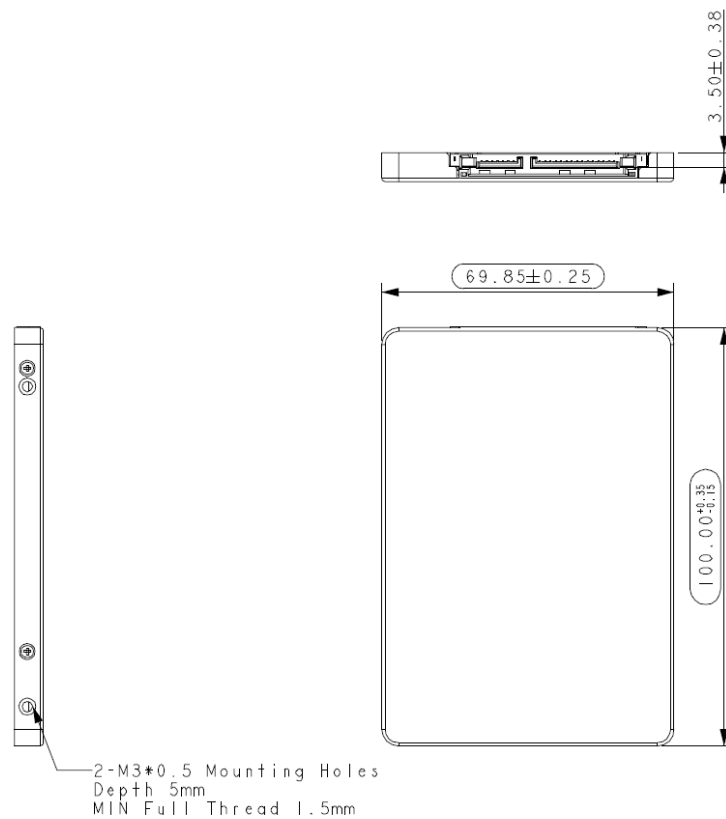

| Parameter         | Rating |
|-------------------|--------|
| Operating Voltage | 5V     |

### 8.2 Power Consumption

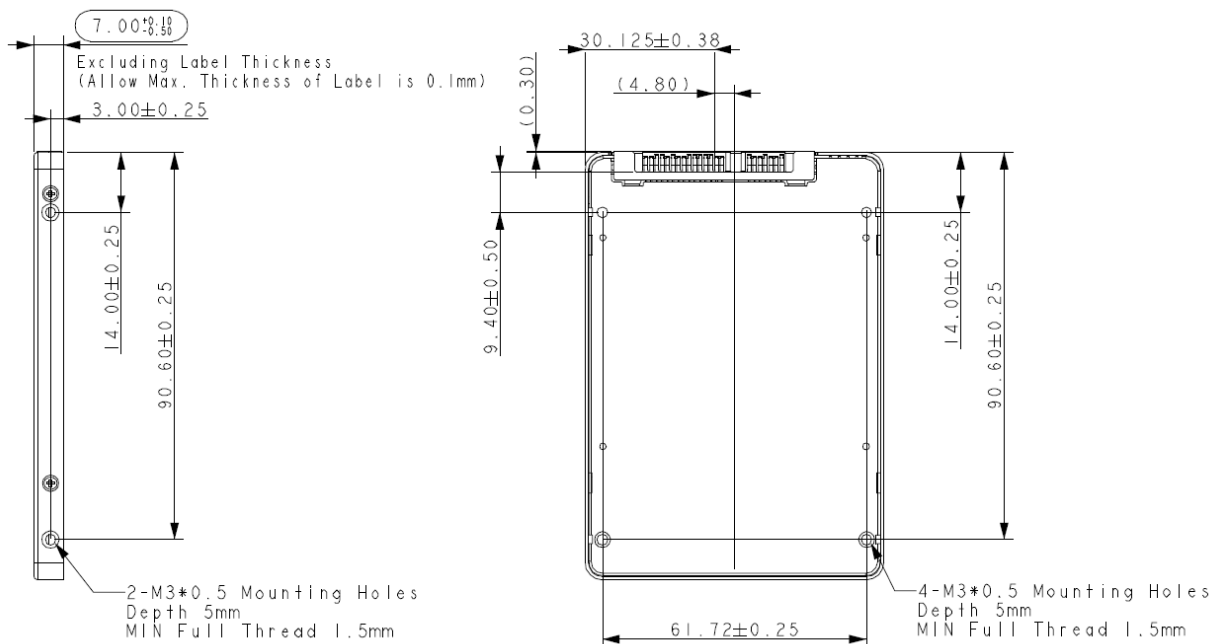

| mA                 |             | Read   | Write  | Idle  | Slumber |
|--------------------|-------------|--------|--------|-------|---------|

| SQF 2.5" SSD 640 1T 3D NAND (BiCS3) (-40~85°C)   | SQF-S25V4-1T-SBE   |

Компания «Life Electronics» занимается поставками электронных компонентов импортного и отечественного производства от производителей и со складов крупных дистрибьюторов Европы, Америки и Азии.

С конца 2013 года компания активно расширяет линейку поставок компонентов по направлению коаксиальный кабель, кварцевые генераторы и конденсаторы (керамические, пленочные, электролитические), за счёт заключения дистрибьюторских договоров

Мы предлагаем:

- Конкурентоспособные цены и скидки постоянным клиентам.
- Специальные условия для постоянных клиентов.
- Подбор аналогов.
- Поставку компонентов в любых объемах, удовлетворяющих вашим потребностям.
- Приемлемые сроки поставки, возможна ускоренная поставка.
- Доставку товара в любую точку России и стран СНГ.
- Комплексную поставку.
- Работу по проектам и поставку образцов.
- Формирование склада под заказчика.
- Сертификаты соответствия на поставляемую продукцию (по желанию клиента).
- Тестирование поставляемой продукции.
- Поставку компонентов, требующих военную и космическую приемку.
- Входной контроль качества.
- Наличие сертификата ISO.

В составе нашей компании организован Конструкторский отдел, призванный помогать разработчикам, и инженерам.

Конструкторский отдел помогает осуществить:

- Регистрацию проекта у производителя компонентов.
- Техническую поддержку проекта.
- Защиту от снятия компонента с производства.
- Оценку стоимости проекта по компонентам.
- Изготовление тестовой платы монтаж и пусконаладочные работы.
