High-Efficiency Charger for Li-Ion Batteries with Photovoltaic Sources

### **Power Management**

**Power and Precision** 

High-Efficiency Charger for Li-Ion Batteries with Photovoltaic Sources

#### **Brief Description**

The ZSPM4521 is a DC/DC synchronous switching lithium-ion (Li-Ion) battery charger with fully integrated power switches, internal compensation, and full fault protection. It uses a temperature-independent photovoltaic maximum power point tracking (MPPT) function to optimize power output from the source during Full-Charge Constant-Current (CC) Mode. Its switching frequency of 1MHz enables the use of small filter components, resulting in smaller board space and reduced bill-of material costs.

During Full-Charge Constant-Current Mode, the duty cycle is controlled by the MPPT regulator. Once the battery's termination voltage is reached, the regulator operates in Constant Voltage Mode. In this mode, the ZSPM4521 modulates the charging current until the battery reaches full charge. When the regulator is disabled (the EN pin is low), the device draws  $10\mu A$  (typical) quiescent current (Disabled Mode).

The ZSPM4521 includes supervisory reporting through the NFLT (inverted fault) open-drain output to interface other components in the system. Device programming is achieved by an  $I^2C^{TM*}$  interface through the SCL and SDA pins.

#### Benefits

- Up to 1.5A of continuous output current in Full-Charge Constant Current (CC) Mode
- High efficiency up to 92% with typical loads

#### **Available Support**

- Evaluation Kit
- Documentation

#### Features

- Temperature-independent photovoltaic maximum power tracking (MPPT) regulator
- VBAT reverse-current blocking
- Programmable temperature-compensated termination voltage: 3.94V to 4.18V ± 1%
- User programmable maximum charge current: 50mA to 1500mA
- Supervisor for  $V_{\text{BAT}}$  reported at the NFLT pin
- Input supply under-voltage lockout
- Full protection for VBAT over-current, overtemperature, VBAT over-voltage, and charging timeout
- Charge status indication
- I<sup>2</sup>C<sup>™</sup> program interface with EEPROM registers

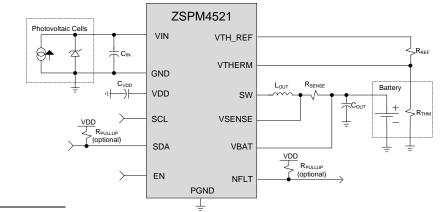

#### **Related ZMDI Smart Power Products**

- ZSPM4523 DC/DC Synchronous Switching Super Capacitor Charger With MPPT Regulator
- ZSPM4551 High-Efficiency Li-Ion Battery Charger
- ZSPM4121 Ultra-low Power Under-Voltage Switch
- ZSPM4141 Ultra-Low-Power Linear Regulator

#### **Physical Characteristics**

- Wide input voltage range: 4.0V to 7.2V
- Junction operating temperature: -40°C to 125°C
- Package: 16-pin PQFN (4mm x 4mm)

#### **ZSPM4521** Application Circuit

High-Efficiency Charger for Li-Ion Batteries with Photovoltaic Sources

#### **ZSPM4521 Block Diagram**

#### **Typical Applications**

- Portable solar chargers
- · Off-grid systems
- Wireless sensor networks
- HVAC controls

High-Efficiency Charger for Li-Ion Batteries with Photovoltaic Sources

#### 1 **ZSPM4521** Characteristics

Important: Stresses beyond those listed under "Absolute Maximum Ratings" (section 1.1) may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under "Recommended Operating Conditions" is not implied. Exposure to absolute–maximum–rated conditions for extended periods may affect device reliability.

#### 1.1. Absolute Maximum Ratings

Over operating free-air temperature range unless otherwise noted.

#### Table 1.1Absolute Maximum Ratings

| Parameter                                                                                                                                                             | Value <sup>1)</sup> | Unit |
|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------|------|
| VIN, EN, NFLT, SCL, SDA, VTHERM, VTH_REF, VBAT, VSENSE                                                                                                                | -0.3 to 8           | V    |
| SW                                                                                                                                                                    | -1 to 8.8           | V    |
| VDD                                                                                                                                                                   | -0.3 to 3.6         | V    |
| Operating Junction Temperature Range, $T_J$                                                                                                                           | -40 to 125          | °C   |
| Storage Temperature Range, T <sub>STOR</sub>                                                                                                                          | -65 to 150          | °C   |

High-Efficiency Charger for Li-Ion Batteries with Photovoltaic Sources

#### 1.3. Recommended Operating Conditions

#### Table 1.3 Recommended Operating Conditions

| Parameter                                           | Symbol             | Min | Тур | Max | Unit |
|-----------------------------------------------------|--------------------|-----|-----|-----|------|
| Photovoltaic Input Operating Voltage at VIN Pin     | V <sub>IN</sub>    | 4.0 | 5.3 | 7.2 | V    |
| Sense Resistor                                      | R <sub>SENSE</sub> |     | 50  |     | mΩ   |
| Output Filter Inductor Typical Value <sup>1)</sup>  | L <sub>OUT</sub>   |     | 4.7 |     | μH   |
| Output Filter Capacitor Typical Value <sup>2)</sup> | Cout               |     | 4.7 |     | μF   |
| Output Filter Capacitor ESR                         | $C_{OUT-ESR}$      |     |     | 100 | mΩ   |
| Input Supply Bypass Capacitor Value 3)              | C <sub>IN</sub>    | 3.3 | 10  |     | μF   |
| VDD Supply Bypass Capacitor Value <sup>2)</sup>     | C <sub>VDD</sub>   | 70  | 100 | 130 | nF   |
| Operating Free Air Temperature                      | T <sub>A</sub>     | -40 |     | 85  | °C   |
| Operating Junction Temperature                      | TJ                 | -40 |     | 125 | °C   |
|                                                     |                    |     |     |     |      |

1) For best performance, use an inductor with a saturation current rating higher than the maximum V<sub>BAT</sub> load requirement plus the inductor current ripple.

2) For best performance, use a low ESR ceramic capacitor.

3) For best performance, use a low ESR ceramic capacitor. If C<sub>IN</sub> is not a low ESR ceramic capacitor, add a 0.1μF ceramic capacitor in parallel to C<sub>IN</sub>.

#### 1.4. Electrical Characteristics

Electrical characteristics  $T_J = -40^{\circ}$ C to 125°C, VIN = 5.3V, (unless otherwise noted)

#### Table 1.4 Electrical Characteristics

| Parameter                          | Symbol                  | Condition                                          | Min | Тур | Max | Unit |

High-Efficiency Charger for Li-Ion Batteries with Photovoltaic Sources

### 2 Functional Description

The ZSPM4521 is a fully-integrated Li-Ion battery charger IC based on a highly-efficient switching topology. It includes a maximum power point tracking (MPPT) function to optimize its input voltage in order to extract the maximum possible power from photovoltaic (PV) cells. It is configurable for termination voltage, charge current, and additional variables to allow optimum charging conditions for a wide range of Li-Ion batteries. A 1MHz internal switching frequency facilitates low-cost LC filter combinations. Figure 2.1 provides a block diagram.

When the battery voltage is below 3.0V, the ZSPM4521 enters a pre-charge state and applies a small, programmable charge current to safely charge the battery to a level for which full-charge current can be applied. Once the Full-Charge Mode has been initiated, the ZSPM4521 will maximize available charge current to the battery by adjusting its duty cycle to regulate its input voltage to the MPP voltage of the photovoltaic (PV) cell. If sufficient current is available from the PV cell to exceed the safe 1C charge rate of the battery, then the programmable 1C current limit function will take precedence over the MPPT control function and the PV cell voltage will rise above the MPP value.

High-Efficiency Charger for Li-Ion Batteries with Photovoltaic Sources

When the battery voltage has increased enough to go into maintenance mode, the PWM control loop will force a constant voltage across the battery. Once in Constant Voltage Mode, current is monitored to determine when the battery is fully charged. See Figure 2.2 for a diagram of the charging states.

The regulation voltage as well as the 1C charging current can be set to change based on the battery temperature. There are four temperature ranges for which the regulation voltage can be set independently: 0°C to 10°C, 10°C to 45°C, 45°C to 50°C, and 50°C to 60°C. The ZSPM4521 will stop charging if the temperature passes the descending temperature threshold at 0°C or the ascending threshold at 60°C. These thresholds have 10 degrees of hysteresis. The intermediate points have 1 degree of hysteresis.

#### 2.1. Internal Protection

#### 2.1.1. VIN Under-Voltage Lockout

The device is held in the off state until the EN pin voltage is HIGH ( $\geq$  2.2V) and VIN reaches 3.15V (typical). There is a 200mV hysteresis on this input, which requires the input to fall below 2.95V (typical) before the device will disable.

#### 2.1.2. Internal Current Limit

The current through the inductor  $L_{OUT}$  is sensed on a cycle-by-cycle basis and if the current limit ( $I_{OCD}$ ; see section 1.4) is reached, the ZSPM4521 will abbreviate the cycle. The current limit is always active when the regulator is enabled.

#### 2.1.3. Thermal Shutdown

If the junction temperature of the ZSPM4521 exceeds 170°C (typical), the SW output will tri-state to protect the device from damage. The NFLT and all other protection circuitry will stay active to inform the system of the failure mode. Once the device cools to 160°C (typical), the device will attempt to start up again. If the device reaches 170°C, the shutdown/restart sequence will repeat.

#### 2.1.4. VBAT Over-Voltage Protection

The ZSPM4521 has a battery protection circuit designed to shut down the charging profile if the battery voltage is greater than the termination voltage. The termination voltage can change based on user programming, so the protection threshold is set to 2% above the termination voltage. Shutting down the charging profile puts the ZSPM4521 in a fault condition.

High-Efficiency Charger for Li-Ion Batteries with Photovoltaic Sources

#### 2.2. Fault Handling

#### 2.2.1. NFLT Pin Functionality

In the event of a battery over-voltage, the battery temperature being outside of the safe charging range, or the full charge timer expiring, charging stops and the NFLT pin is pulled low. When the fault condition is no longer present, the device will enter the INITIALIZE state (see Figure 2.2), but the NFLT pin will remain low until the STATUS register ( $00_{HEX}$ ) is read (see Table 2.2). When the STATUS register is read, the NFLT pin will go high until a new fault is detected.

#### 2.2.2. Other Faults

When an open thermistor, thermal shutdown, VIN under-voltage, or top-off time-out are detected, charging immediately stops and the corresponding bit in the STATUS register ( $00_{HEX}$ ) is set. The device will enter the INITIALIZE state until the fault is no longer detected.

High-Efficiency Charger for Li-Ion Batteries with Photovoltaic Sources

#### 2.3. Serial Interface

The ZSPM4521 features an  $I^2C^{TM}$  slave interface that offers advanced control and diagnostic features. It supports standard and fast mode data rates and auto-sequencing, and it is compliant to  $I^2C^{TM}$  standard version 3.0.

I<sup>2</sup>C<sup>™</sup> operation offers configuration control for termination voltages, charge currents, and charge timeouts. This configurability allows optimum charging conditions in a wide range of Li-Ion batteries. I<sup>2</sup>C<sup>™</sup> operation also offers fault and warning indicators. Whenever a fault is detected, the associated status bit in the STATUS register is set and the NFLT pin is pulled low. Whenever a warning is detected, the associated status bit in the STATUS register is set, but the NFLT pin is not pulled low. Reading the STATUS register resets the fault and warning status bits, and the NFLT pin is released after all fault status bits have been reset.

#### 2.3.1. **I<sup>2</sup>C<sup>™</sup> Subaddress Definition**

#### Figure 2.3 Subaddress in $f^2 C^{TM}$ Transmission

#### 2.3.2. I<sup>2</sup>C<sup>™</sup> Bus Operation

The ZSPM4521's  $l^2C^{TM}$  is a two-wire serial interface; the two lines are serial clock (SCL) and serial data (SDA) (see Figure 2.4). SDA must be connected to a positive supply (e.g., the VDD pin) through an external pull-up resistor. The devices communicating on this bus can drive the SDA line low or release it to high impedance. To ensure proper operation, setup and hold times must be met (see Table 1.5). The device that initiates the  $l^2C^{TM}$  transaction becomes the master of the bus.

Communication is initiated by the master sending a START condition, which is a high-to-low transition on SDA while the SCL line is high. After the START condition, the device address byte is sent, most significant bit (MSB) first, including the data direction bit (read = 1; write = 0). After receiving the valid address byte, the device responds with an acknowledge (ACK). An ACK is a low on SDA during the high of the ACK-related clock pulse. On the  $I^2C^{TM}$  bus, during each clock pulse, only one data bit is transferred. The data on the SDA line must remain stable during the high pulse of the clock period, as changes in the data line at this time are interpreted as START or STOP control conditions. A low-to-high transition on SDA while the SCL input is high indicates a STOP condition and is sent by the master.

| Data Sheet      | © 2014 Zentrum Mikroelektronik Dresden AG — Rev. 1.01                                                                                                                                                                                                                | 10.101   |

ZSPM4521 High-Efficiency Charger for Li-Ion Batteries with Photovoltaic Sources

Any number of data bytes can be transferred from the transmitter to receiver between the START and the STOP conditions. Each byte of eight bits is followed by one ACK bit from the receiver. The SDA line must be released by the transmitter before the receiver can send an ACK bit. The receiver that acknowledges must pull down the SDA line during the ACK clock pulse, so that the SDA line is stable low during the high pulse of the ACK-related clock period. When a slave receiver is addressed, it must generate an ACK after each byte is received. Similarly, the master must generate an ACK after each byte that it receives from the slave transmitter. An end of data is signaled by the master receiver to the slave transmitter by not generating an acknowledge after the last byte has been clocked out of the slave. This is done by the master receiver by holding the SDA line high. The transmitter must then release the data line to enable the master to generate a STOP condition.

See Table 1.5 for the definitions and specifications for the timing parameters labeled in Figure 2.5.

1) EOC Note: Maximum output current when  $V_{BAT} \ge 3.0V$ .

V\_TERM Note: There are separate settings for battery temperatures 0-10°C, 10-45°C, 45-50°C, and 50-60°C (see Table 2.3 for 0-10°C and 10-45°C). For <0°C and >60°C, charging is disabled and a fault is set.

High-Efficiency Charger for Li-Ion Batteries with Photovoltaic Sources

#### **3** Application Circuits

#### 3.1. Typical Application Circuit

#### 3.2. Selection of External Components

Note that the internal compensation is optimized for a  $4.7\mu$ F output capacitor (C<sub>OUT</sub>) and a  $4.7\mu$ H output inductor (L<sub>OUT</sub>). Table 1.3 provides recommended ranges for most of the following components.

#### 3.2.1. C<sub>OUT</sub> Output Capacitor

To keep the output ripple low, a low ESR (less than  $35m\Omega$ ) ceramic capacitor is recommended for the  $4.7\mu$ F output filter capacitor. The ESR should not exceed  $100m\Omega$ .

#### 3.2.2. L<sub>OUT</sub> Output Inductor

For best performance, an inductor with a saturation current rating higher than the maximum  $V_{OUT}$  load requirement plus the inductor current ripple should be used for the 4.7µH output filter inductor.

#### 3.2.3. C<sub>IN</sub> Bypass Capacitor for Input from Photovoltaic Source

For best performance, a low ESR ceramic capacitor should be used for the  $10\mu$ F input supply bypass capacitor. If it is not a low ESR ceramic capacitor, a  $0.1\mu$ F ceramic capacitor should be added in parallel to C<sub>IN</sub>.

High-Efficiency Charger for Li-Ion Batteries with Photovoltaic Sources

#### 3.2.4. C<sub>VDD</sub> Bypass Capacitor for VDD Internal Reference Voltage Output

For best performance, a low ESR ceramic capacitor should be used for the100nF bypass capacitor from the VDD pin to ground.

#### 3.2.5. R<sub>SENSE</sub> Output Sensing Resistor

The typical value for the output sensing resistor is  $50m\Omega$ .

#### 3.2.6. Pull-up Resistors

For proper function of the I<sup>2</sup>C<sup>™</sup> interface, the SDA pin must be connected to a positive supply (e.g., the VDD pin) through an external pull-up resistor.

For proper function of the fault-warning signal on the NFLT pin, it must be connected to a positive supply (VDD) through an external pull-up resistor.

High-Efficiency Charger for Li-Ion Batteries with Photovoltaic Sources

#### 5 Layout Recommendations

To maximize the efficiency of this package for application on a single layer or multi-layer PCB, certain guidelines must be followed when laying out this part on the PCB.

#### 5.1. Multi-Layer PCB Layout

The following are guidelines for mounting the exposed pad ZSPM4521 on a multi-layer PCB with ground a plane. In a multi-layer board application, the thermal vias are the primary method of heat transfer from the package thermal pad to the internal ground plane. The efficiency of this method depends on several factors, including die area, number of thermal vias, and thickness of copper, etc.

ZSPM4521 High-Efficiency Charger for Li-Ion Batteries with Photovoltaic Sources

Figure 5.3 is a representation of how the heat can be conducted away from the die using an exposed pad package. Each application will have different requirements and limitations, and therefore the user should use sufficient copper to dissipate the power in the system. The output current rating for the linear regulators might need to be de-rated for higher ambient temperatures. The de-rated value will depend on calculated worst-case power dissipation and the thermal management implementation in the application.

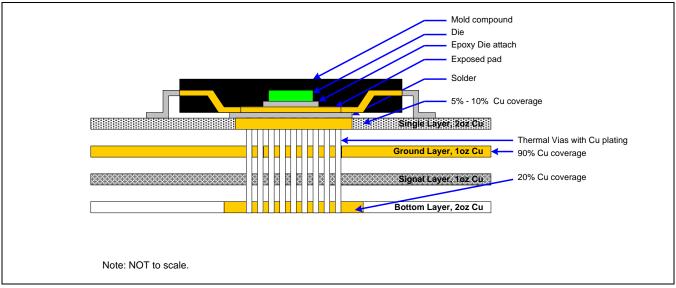

Figure 5.3 Conducting Heat Away from the Die using an Exposed Pad Package

#### 5.2. Single-Layer PCB Layout

Layout recommendations for a single-layer PCB: Utilize as much copper area for power management as possible. In a single-layer board application, the thermal pad is attached to a heat spreader (copper areas) by using a low thermal impedance attachment method (solder paste or thermal conductive epoxy).

In both of the methods mentioned above, it is advisable to use as much copper trace as possible to dissipate the heat.

**Important:** If the attachment method is NOT implemented correctly, the functionality of the product is NOT guaranteed. Power dissipation capability will be adversely affected if the device is incorrectly mounted onto the circuit board.

#### ООО "ЛайфЭлектроникс"

ИНН 7805602321 КПП 780501001 Р/С 40702810122510004610 ФАКБ "АБСОЛЮТ БАНК" (ЗАО) в г.Санкт-Петербурге К/С 3010181090000000703 БИК 044030703

Компания «Life Electronics» занимается поставками электронных компонентов импортного и отечественного производства от производителей и со складов крупных дистрибьюторов Европы, Америки и Азии.

С конца 2013 года компания активно расширяет линейку поставок компонентов по направлению коаксиальный кабель, кварцевые генераторы и конденсаторы (керамические, пленочные, электролитические), за счёт заключения дистрибьюторских договоров

Мы предлагаем:

- Конкурентоспособные цены и скидки постоянным клиентам.
- Специальные условия для постоянных клиентов.
- Подбор аналогов.
- Поставку компонентов в любых объемах, удовлетворяющих вашим потребностям.
- Приемлемые сроки поставки, возможна ускоренная поставка.
- Доставку товара в любую точку России и стран СНГ.
- Комплексную поставку.
- Работу по проектам и поставку образцов.
- Формирование склада под заказчика.
- Сертификаты соответствия на поставляемую продукцию (по желанию клиента).
- Тестирование поставляемой продукции.
- Поставку компонентов, требующих военную и космическую приемку.
- Входной контроль качества.
- Наличие сертификата ISO.

В составе нашей компании организован Конструкторский отдел, призванный помогать разработчикам, и инженерам.

Конструкторский отдел помогает осуществить:

- Регистрацию проекта у производителя компонентов.
- Техническую поддержку проекта.
- Защиту от снятия компонента с производства.
- Оценку стоимости проекта по компонентам.
- Изготовление тестовой платы монтаж и пусконаладочные работы.
