4896 (H) x 3264 (V) Interline CCD Image Sensor

Description

The KAI-16050 Image Sensor is a 16-megapixel CCD in an APS-H optical format. Based on the TRUESENSE 5.5 micron Interline Transfer CCD Platform, the sensor features broad dynamic range, excellent imaging performance, and a flexible readout architecture that enables use of 1, 2, or 4 outputs for full resolution readout up to 8 frames per second. A vertical overflow drain structure suppresses image blooming and enables electronic shuttering for precise exposure control.

The sensor is available with the TRUESENSE Sparse Color Filter Pattern, a technology which provides a 2x improvement in light sensitivity compared to a standard color Bayer part.

The sensor shares common PGA pin-out and electrical configurations with other devices based on the TRUESENSE 5.5 micron Interline Transfer CCD Platform, allowing a single camera design to be leveraged to support multiple members of this sensor family.

Table 1. GENERAL SPECIFICATIONS

Parameter	Typical Value					
Architecture	Interline CCD; Progressive Scan					
Total Number of Pixels	4964 (H) x 3332 (V)					
Number of Effective Pixels	()					
	4920 (H) x 3288 (V)					
Number of Active Pixels	4896 (H) x 3264 (V)					
Pixel Size	5.5 μm (H) x 5.5 μm (V)					
Active Image Size	26.93 mm (H) x 17.95 mm (V) 32.36 mm (diag.) APS-H Format					
Aspect Ratio	3:2					
Number of Outputs	1, 2, or 4					
Charge Capacity	20,000 electrons					
Output Sensitivity	34 μV/e ⁻					
Quantum Efficiency Pan (-AXA, -QXA, -PXA) R, G, B (-FXA, -QXA) R, G, B (-CXA, -PXA)	43% 28%, 35%, 38% 29%, 35%, 37%					
Read Noise (f = 40 MHz)	12 electrons rms					
Dark Current Photodiode VCCD	2 electrons/s 140 electrons/s					
Dark Current Doubling Temp. Photodiode VCCD	7°C 9°C					
Dynamic Range	64 dB					
Charge Transfer Efficiency	0.999999					
Blooming Suppression	> 300 X					
Smear	Estimated –100 dB					
Image Lag	< 10 electrons					
Maximum Pixel Clock Speed	40 MHz					
Maximum Frame Rates Quad Output Dual Output Single Output	8 fps 4 fps 2 fps					
Package	72 pin PGA					
Cover Glass	AR coated, 2 Sides					

NOTE: All parameters are specified at T = 40°C unless otherwise noted.

Figure 1. KAI-16050 CCD Image Sensor

Features

- Bayer Color Pattern, TRUESENSE Sparse Color Filter Pattern, and Monochrome Configurations
- Progressive Scan Readout
- Flexible Readout Architecture
- High Frame Rate
- High Sensitivity
- Low Noise Architecture
- Excellent Smear Performance
- Package Pin Reserved for Device Identification

Applications

- Industrial Imaging and Inspection
- Traffic
- Security

ORDERING INFORMATION

See detailed ordering and shipping information on page 2 of this data sheet.

DEVICE DESCRIPTION

Architecture

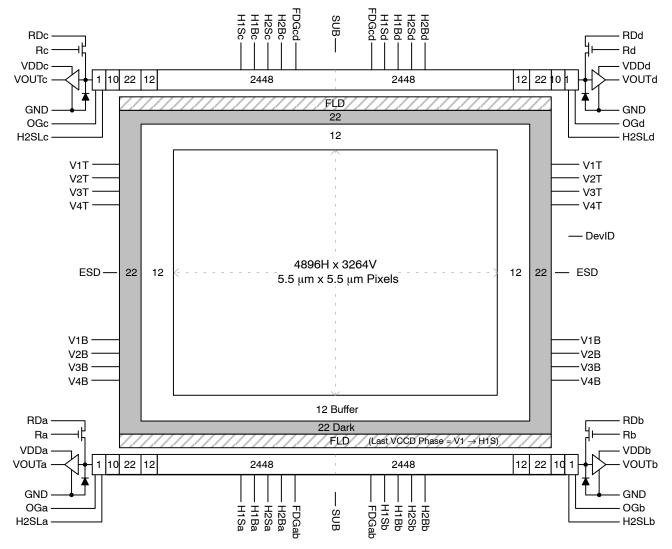

Figure 2. Block Diagram

Dark Reference Pixels

There are 22 dark reference rows at the top and 22 dark rows at the bottom of the image sensor. The dark rows are not entirely dark and so should not be used for a dark reference level. Use the 22 dark columns on the left or right side of the image sensor as a dark reference.

Under normal circumstances use only the center 20 columns of the 22 column dark reference due to potential light leakage.

Dummy Pixels

Within each horizontal shift register there are 11 leading additional shift phases. These pixels are designated as dummy pixels and should not be used to determine a dark reference level.

In addition, there is one dummy row of pixels at the top and bottom of the image.

Active Buffer Pixels

12 unshielded pixels adjacent to any leading or trailing dark reference regions are classified as active buffer pixels. These pixels are light sensitive but are not tested for defects and non–uniformities.

Image Acquisition

An electronic representation of an image is formed when incident photons falling on the sensor plane create electron-hole pairs within the individual silicon photodiodes. These photoelectrons are collected locally by the formation of potential wells at each photosite. Below photodiode saturation, the number of photoelectrons collected at each pixel is linearly dependent upon light level and exposure time and non-linearly dependent on wavelength. When the photodiodes charge capacity is reached, excess electrons are discharged into the substrate to prevent blooming.

ESD Protection

Adherence to the power-up and power-down sequence is critical. Failure to follow the proper power-up and

power-down sequences may cause damage to the sensor. See Power-Up and Power-Down Sequence section.

DEFECT DEFINITIONS

Table 11. OPERATION CONDITIONS FOR DEFECT TESTING AT 40°C

Description	Condition	Notes
Operational Mode	Two outputs, using VOUTa and VOUTc, continuous readout	
HCCD Clock Frequency	10 MHz	
Pixels Per Line	5120	1
Lines Per Frame	1760	2
Line Time	547.7 μsec	
Frame Time	964.0 msec	
Photodiode Integration Time (PD_Tint)	Mode A: PD_Tint = Frame Time = 964.0 msec, no electronic shutter used	
VCCD Integration Time	912.5 msec	3
Temperature	40°C	
Light Source	Continuous red, green and blue LED illumination	4
Operation	Nominal operating voltages and timing	

- 1. Horizontal overclocking used.
- Vertical overclocking used.
- 3. VCCD Integration Time = 1666 lines x Line Time, which is the total time a pixel will spend in the VCCD registers.
- 4. For monochrome sensor, only the green LED is used.

Table 12. DEFECT DEFINITIONS FOR TESTING AT 40°C

Description	Definition	Grade 1	Grade 2 Mono	Grade 2 Color	Notes
Major dark field defective bright pixel	PD_Tint = Mode A → Defect ≥ 328 mV	150	300	300	1
Major bright field defective dark pixel	Defect ≥ 12%				
Minor dark field defective bright pixel	PD_Tint = Mode A → Defect ≥ 164 mV	1500	3000	3000	
Cluster defect	A group of 2 to 19 contiguous major defective pixels, but no more than 3 adjacent defects horizontally.	20	n/a	n/a	2
Cluster defect	A group of 2 to 38 contiguous major defective pixels, but no more than 5 adjacent defects horizontally.	n/a	30	30	
Column defect	A group of more than 10 contiguous major defective pixels along a single column	0	4	15	2

^{1.} For the color devices (KAI-16050-CXA and KAI-16050-PXA), a bright field defective pixel deviates by 12% with respect to pixels of the same color.

^{2.} Column and cluster defects are separated by no less than two (2) good pixels in any direction (excluding single pixel defects).

Table 13. OPERATION CONDITIONS FOR DEFECT TESTING AT 27°C

Description	Condition	Notes

Cluster defect	A group of 2 to 19 contiguous major defective pixels, but no more than 3 adjacent defects horizontally.	20	n/a	n/a	2
Cluster defect	A group of 2 to 38 contiguous major defective pixels, but no more than 5 adjacent defects horizontally.	n/a	30	30	
Column defect	A group of more than 10 contiguous major defective pixels along a single column	0	4	15	2

^{1.} For the color devices (KAI-16050-CXA and KAI-16050-PXA), a bright field defective pixel deviates by 12% with respect to pixels of the same color.

Defect Map

The defect map supplied with each sensor is based upon testing at an ambient (27°C) temperature. Minor point

defects are not included in the defect map. All defective pixels are reference to pixel 1, 1 in the defect maps. See Figure 13: Regions of interest for the location of pixel 1,1.

^{2.} Vertical overclocking used.

^{3.} VCCD Integration Time = 1666 lines x Line Time, which is the total time a pixel will spend in the VCCD registers.

^{4.} For monochrome sensor, only the green LED is used.

^{2.} Column and cluster defects are separated by no less than two (2) good pixels in any direction (excluding single pixel defects).

TEST DEFINITIONS

Test Regions of Interest

Image Area ROI: Pixel (1, 1) to Pixel (4920, 3288)

Active Area ROI: Pixel (13, 13) to Pixel (4908, 3276)

Center ROI: Pixel (2411, 1595) to Pixel (2510, 1694)

Only the Active Area ROI pixels are used for performance and defect tests.

Overclocking

The test system timing is configured such that the sensor is overclocked in both the vertical and horizontal directions.

VOUTa **←**

See Figure 13 for a pictorial representation of the regions of interest.

Figure 13. Regions of Interest

Tests

Dark Field Global Non-Uniformity

This test is performed under dark field conditions. The sensor is partitioned into 864 sub regions of interest, each of which is 136 by 136 pixels in size. The average signal level of each of the 864 sub regions of interest is calculated. The signal level of each of the sub regions of interest is calculated using the following formula:

Signal of ROI[i] = (ROI Average in counts – Horizontal overclock average in counts) * mV per count

Where i = 1 to 864. During this calculation on the 864 sub regions of interest, the maximum and minimum signal levels

 $GlobalNon-Uniformity = 100 \times \left(\frac{ActiveAreaStandardDeviation}{ActiveAreaSignal}\right)$

Units: %rms.

Active Area Signal = Active Area Average - Dark Column Average

Global Peak to Peak Non-Uniformity

This test is performed with the imager illuminated to a level such that the output is at 70% of saturation (approximately 476 mV). Prior to this test being performed the substrate voltage has been set such that the charge capacity of the sensor is 680 mV. The sensor is partitioned into 864 sub regions of interest, each of which is 136 by 136

 $Global Uniformity = 100 \times \frac{Maximum Signal - Minimum Signal}{Active Area Signal}$

Center Non-Uniformity This test is performed with the imager illuminated to a level such that the output is at 70% of saturation (approximately 476 mV). Prior to this test being performed

Units: %rms.

Units: %pp

Center ROI Signal = Center ROI Average - Dark Column Average

Dark Field Defect Test

This test is performed under dark field conditions. The sensor is partitioned into 864 sub regions of interest, each of which is 136 by 136 pixels in size. In each region of interest, the median value of all pixels is found. For each region of interest, a pixel is marked defective if it is greater than or equal to the median value of that region of interest plus the defect threshold specified in the "Defect Definitions" section.

Bright Field Defect Test

This test is performed with the imager illuminated to a level such that the output is at approximately 476 mV. Prior are found. The dark field global uniformity is then calculated as the maximum signal found minus the minimum signal level found.

Units: mVpp (millivolts peak to peak)

Global Non-Uniformity

This test is performed with the imager illuminated to a level such that the output is at 70% of saturation (approximately 476 mV). Prior to this test being performed the substrate voltage has been set such that the charge capacity of the sensor is 680 mV. Global non-uniformity is defined as

pixels in size. The average signal level of each of the 864 sub regions of interest (ROI) is calculated. The signal level of each of the sub regions of interest is calculated using the following formula:

Signal of ROI[i] = (ROI Average in counts – Horizontal overclock average in counts) * mV per count

Where i = 1 to 864. During this calculation on the 864 sub regions of interest, the maximum and minimum signal levels are found. The global peak to peak uniformity is then calculated as:

the substrate voltage has been set such that the charge capacity of the sensor is 680 mV. Defects are excluded for the calculation of this test. This test is performed on the center 100 by 100 pixels of the sensor. Center uniformity is defined as:

Center ROI Uniformity = $100 \times \left(\frac{\text{Center ROI Standard Deviation}}{\text{Center ROI Signal}} \right)$

to this test being performed the substrate voltage has been set such that the charge capacity of the sensor is 680 mV. The average signal level of all active pixels is found. The bright and dark thresholds are set as:

Dark defect threshold = Active Area Signal * threshold Bright defect threshold = Active Area Signal * threshold

The sensor is then partitioned into 864 sub regions of interest, each of which is 136 by 136 pixels in size. In each region of interest, the average value of all pixels is found. For each region of interest, a pixel is marked defective if it is greater than or equal to the median value of that region of interest plus the bright threshold specified or if it is less than or equal to the median value of that region of interest minus the dark threshold specified.

Example for major bright field defective pixels:

- Average value of all active pixels is found to be 476 mV
- Dark defect threshold: 476 mV * 12 % = 57 mV
- Region of interest #1 selected. This region of interest is pixels 13, 13 to pixels 148, 148.
 - Median of this region of interest is found to be 470 mV.
 - Any pixel in this region of interest that is ≤ (470 – 57 mV) 413 mV in intensity will be marked defective.
- All remaining 836 sub regions of interest are analyzed for defective pixels in the same manner.

OPERATION

Table 15. ABSOLUTE MAXIMUM RATINGS

Description	Symbol	Minimum	Maximum	Units	Notes
Operating Temperature	T _{OP}	-50	+70	°C	1
Humidity	RH	+5	+90	%	2
Output Bias Current	l _{out}		60	mA	3
Off-chip Load	C _L		10	pF	

Stresses exceeding those listed in the Maximum Ratings table may damage the device. If any of these limits are exceeded, device functionality should not be assumed, damage may occur and reliability may be affected.

- 1. Noise performance will degrade at higher temperatures.
- 2. T = 25°C. Excessive humidity will degrade MTTF.
- 3. Total for all outputs. Maximum current is -15 mA for each output. Avoid shorting output pins to ground or any low impedance source during operation. Amplifier bandwidth increases at higher current and lower load capacitance at the expense of reduced gain (sensitivity).

Table 16. ABSOLUTE MAXIMUM VOLTAGE RATINGS BETWEEN PINS AND GROUND

Description	Minimum	Maximum	Units	Notes
VDDα, VOUΤα	-0.4	17.5	V	1
RDα	-0.4	15.5	V	1
V1B, V1T	ESD - 0.4	ESD + 24.0	V	
V2B, V2T, V3B, V3T, V4B, V4T	ESD - 0.4	ESD + 14.0	V	
FDGab, FDGcd	ESD - 0.4	ESD + 15.0	V	
H1Sα, H1Bα, H2Sα, H2Bα, H2SLα, Rα, OGα	ESD - 0.4	ESD + 14.0	V	1
ESD	-10.0	0.0	V	
SUB	-0.4	40.0	V	2

^{1.} α denotes a, b, c or d

Power-Up and Power-Down Sequence

Adherence to the power-up and power-down sequence is critical. Failure to follow the proper power-up and power-down sequences may cause damage to the sensor.

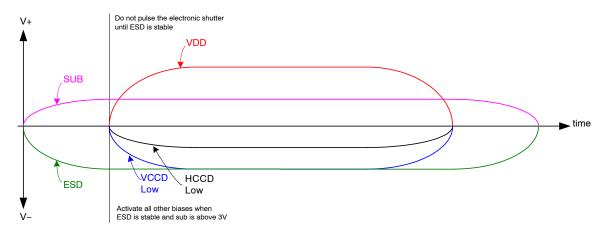

Figure 14. Power-Up and Power-Down Sequence

Notes:

- 1. Activate all other biases when ESD is stable and SUB is above 3 V
- 2. Do not pulse the electronic shutter until ESD is stable
- 3. VDD cannot be +15 V when SUB is 0 V

4. The image sensor can be protected from an accidental improper ESD voltage by current limiting the SUB current to less than 10 mA. SUB and VDD must always be greater than GND. ESD must always be less than GND. Placing diodes between SUB, VDD, ESD and ground will protect

^{2.} Refer to Application Note Using Interline CCD Image Sensors in High Intensity Visible Lighting Conditions.

the sensor from accidental overshoots of SUB, VDD and ESD during power on and power off. See the figure below.

The VCCD clock waveform must not have a negative overshoot more than 0.4 V below the ESD voltage.

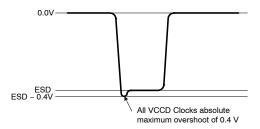

Figure 15.

Example of external diode protection for SUB, VDD and ESD. α denotes a, b, c or d

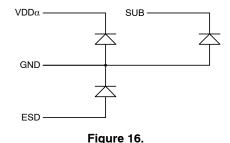

Table 17. DC BIAS OPERATING CONDITIONS

Description	Pins	Symbol	Minimum	Nominal	Maximum	Units	Maximum DC Current	Notes
Reset Drain	RDα	RD	+11.8	+12.0	+12.2	V	10 μΑ	1
Output Gate	OGα	OG	-2.2	-2.0	-1.8	V	10 μΑ	1
Output Amplifier Supply	VDDα	VDD	+14.5	+15.0	+15.5	V	11.0 mA	1,2
Ground	GND	GND	0.0	0.0	0.0	V	−1.0 mA	
Substrate	SUB	VSUB	+5.0	VAB	VDD	V	50 μΑ	3, 8
ESD Protection Disable	ESD	ESD	-9.5	-9.0	Vx_L	V	50 μΑ	6, 7, 9
Output Bias Current	VOUTα	lout	-3.0	-7.0	-10.0	mA		1, 4, 5

- 1. α denotes a, b, c or d
- 2. The maximum DC current is for one output. Idd = lout + Iss. See Figure 17.
- The operating value of the substrate voltage, VAB, will be marked on the shipping container for each device. The value of VAB is set such that the photodiode charge capacity is the nominal PNe (see Specifications).
- 4. An output load sink must be applied to each VOUT pin to activate each output amplifier.
 5. Nominal value required for 40 MHz operation per output. May be reduced for slower data rates and lower noise.
- 6. Adherence to the power-up and power-down sequence is critical. See Power-Up and Power-Down Sequence section.
- 7. ESD maximum value must be less than or equal to V1_L + 0.4 V and V2_L + 0.4 V
- 8. Refer to Application Note Using Interline CCD Image Sensors in High Intensity Visible Lighting Conditions
- 9. Where Vx_L is the level set for V1_L, V2_L, V3_L, or V4_L in the application.

		FDG_H	High	+4.5	+5.0	+5.5				

- 1. α denotes a, b, c or d
- 2. Capacitance is total for all like named pins
- 3. Use separate clock driver for improved speed performance.
- 4. Reset low should be set to -3 volts for signal levels greater than 40,000 electrons.
- 5. Refer to Application Note Using Interline CCD Image Sensors in High Intensity Visible Lighting Conditions
- 6. Capacitance values are estimated
- 7. If the minimum horizontal clock low level is used (-5.2 V), then the maximum horizontal clock amplitude should be used (5.2 V amplitude) to create a -5.2 V to 0.0 V clock. If a 5 V clock driver is used, the horizontal low level should be set to -5.0 V and the high level should be a set to 0.0 V.

The figure below shows the DC bias (VSUB) and AC clock (VES) applied to the SUB pin. Both the DC bias and AC clock are referenced to ground.

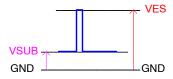

Figure 18.

Device Identification

The device identification pin (DevID) may be used to determine which ON Semiconductor 5.5 micron pixel interline CCD sensor is being used.

Table 19. DEVICE IDENTIFICATION

Description	Pins	Symbol	Minimum	Nominal	Maximum	Units	Maximum DC Current	Notes
Device Identification	DevID	DevID	144,000	180,000	216,000	Ω	50 μΑ	1, 2, 3

- 1. Nominal value subject to verification and/or change during release of preliminary specifications.
- 2. If the Device Identification is not used, it may be left disconnected.
- 3. After Device Identification resistance has been read during camera initialization, it is recommended that the circuit be disabled to prevent localized heating of the sensor due to current flow through the R_DeviceID resistor.

Recommended Circuit

Note that V1 must be a different value than V2.

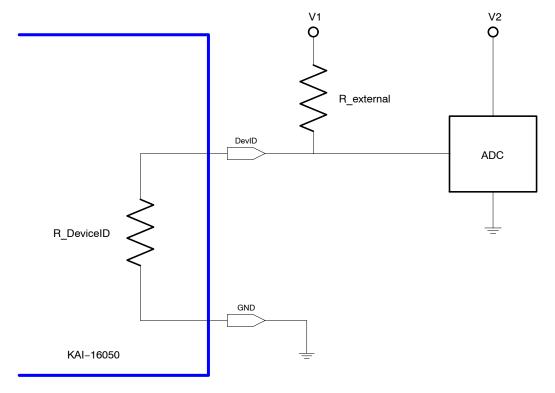

Figure 19. Device Identification Recommended Circuit

Rd	P7	P7 ¹ or Off ³	P7 ¹ or Off ³	P7 ¹ or Off ³	

# Lines/Frame (Minimum)	1666	3332	1666	3332
# Pixels/Line (Minimum)	24	32	49	84

^{1.} For optimal performance of the sensor. May be clocked at a lower frequency. If clocked at a lower frequency, the frequency selected should be a multiple of the frequency used on the a and b register.

^{2.} H2SLx follows the same pattern as H2Sx For optimal speed performance, use a separate clock driver.

^{3.} Off = +5 V. Note that there may be operating conditions (high temperature and/or very bright light sources) that will cause blooming from the unused c/d register into the image area.

Photodiode Transfer Timing

A row of charge is transferred to the HCCD on the falling edge of V1 as indicated in the P1 pattern below. Using this timing sequence, the leading dummy row or line is combined with the first dark row in the HCCD. The "Last Line" is dependent on readout mode – either 1666 or 3332 minimum counts required. It is important to note that, in

general, the rising edge of a vertical clock (patterns P1–P4) should be coincident or slightly leading a falling edge at the same time interval. This is particularly true at the point where P1 returns from the high (3rd level) state to the mid–state when P4 transitions from the low state to the high state.

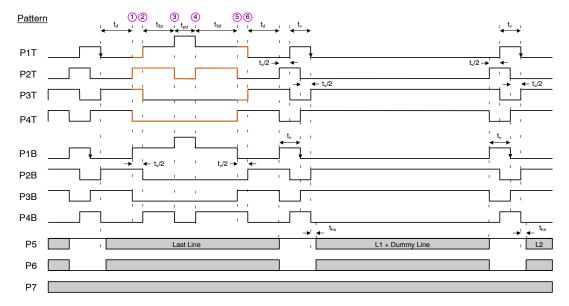

Figure 20. Photodiode Transfer Timing

Line and Pixel Timing

Each row of charge is transferred to the output, as illustrated below, on the falling edge of H2SL (indicated as P6 pattern). The number of pixels in a row is dependent on

readout mode – either 2492 or 4984 minimum counts required.

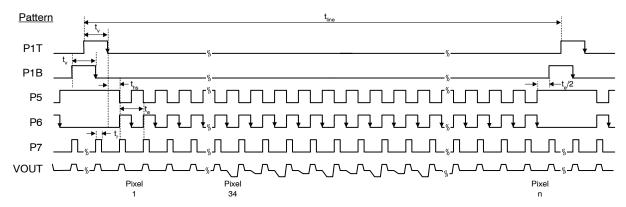

Figure 21. Line and Pixel Timing

Pixel Timing Detail

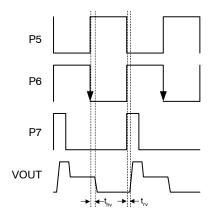

Figure 22. Pixel Timing Detail

Frame/Electronic Shutter Timing

The SUB pin may be optionally clocked to provide electronic shuttering capability as shown below.

The resulting photodiode integration time is defined from the falling edge of SUB to the falling edge of V1 (P1 pattern).

Line and Pixel Timing - Vertical Binning by 2

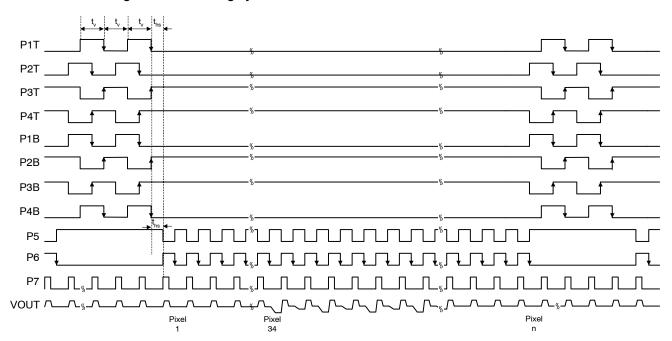

Figure 25. Line and Pixel Timing - Vertical Binning by 2

Fast Line Dump Timing

The FDG pins may be optionally clocked to efficiently remove unwanted lines in the image resulting for increased frame rates at the expense of resolution. Below is an example of a 2 line dump sequence followed by a normal readout line.

Note that the FDG timing transitions should complete prior to the beginning of V1 timing transitions as illustrated below.

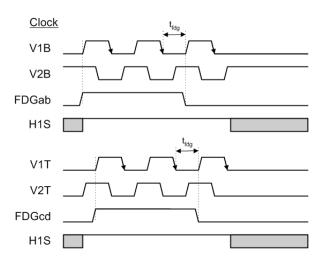

Figure 26. Fast Line Dump Timing

STORAGE AND HANDLING

Table 22. STORAGE CONDITIONS

Description	Symbol	Minimum	Maximum	Units	Notes
Storage Temperature	T _{ST}	-55	+80	°C	1
Humidity	RH	5	90	%	2

^{1.} Long term storage toward the maximum temperature will accelerate color filter degradation.

For information on ESD and cover glass care and cleanliness, please download the *Image Sensor Handling and Best Practices* Application Note (AN52561/D) from www.onsemi.com.

For information on soldering recommendations, please download the Soldering and Mounting Techniques Reference Manual (SOLDERRM/D) from www.onsemi.com.

For quality and reliability information, please download the *Quality & Reliability* Handbook (HBD851/D) from www.onsemi.com.

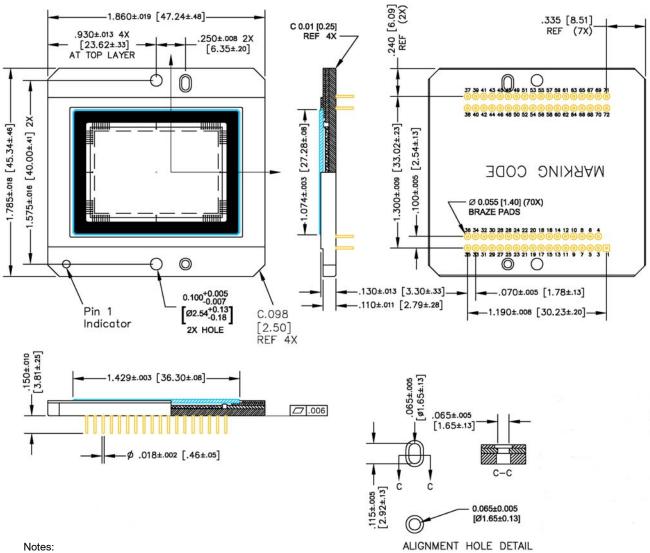

For information on device numbering and ordering codes, please download the *Device Nomenclature* technical note (TND310/D) from www.onsemi.com.

For information on Standard terms and Conditions of Sale, please download <u>Terms and Conditions</u> from <u>www.onsemi.com</u>.

^{2.} T = 25°C. Excessive humidity will degrade MTTF.

OOO «ЛайфЭлектроникс" "LifeElectronics" LLC

ИНН 7805602321 КПП 780501001 P/C 40702810122510004610 ФАКБ "АБСОЛЮТ БАНК" (ЗАО) в г.Санкт-Петербурге К/С 3010181090000000703 БИК 044030703

Компания «Life Electronics» занимается поставками электронных компонентов импортного и отечественного производства от производителей и со складов крупных дистрибьюторов Европы, Америки и Азии.

С конца 2013 года компания активно расширяет линейку поставок компонентов по направлению коаксиальный кабель, кварцевые генераторы и конденсаторы (керамические, пленочные, электролитические), за счёт заключения дистрибьюторских договоров

Мы предлагаем:

- Конкурентоспособные цены и скидки постоянным клиентам.
- Специальные условия для постоянных клиентов.
- Подбор аналогов.
- Поставку компонентов в любых объемах, удовлетворяющих вашим потребностям.
- Приемлемые сроки поставки, возможна ускоренная поставка.
- Доставку товара в любую точку России и стран СНГ.
- Комплексную поставку.
- Работу по проектам и поставку образцов.
- Формирование склада под заказчика.
- Сертификаты соответствия на поставляемую продукцию (по желанию клиента).
- Тестирование поставляемой продукции.
- Поставку компонентов, требующих военную и космическую приемку.
- Входной контроль качества.
- Наличие сертификата ISO.

В составе нашей компании организован Конструкторский отдел, призванный помогать разработчикам, и инженерам.

Конструкторский отдел помогает осуществить:

- Регистрацию проекта у производителя компонентов.
- Техническую поддержку проекта.
- Защиту от снятия компонента с производства.
- Оценку стоимости проекта по компонентам.
- Изготовление тестовой платы монтаж и пусконаладочные работы.
