

# dsPIC33FJ32GS406/606/608/610 and dsPIC33FJ64GS406/606/608/610

## 16-Bit Digital Signal Controllers with High-Speed PWM, ADC and Comparators

### Operating Conditions

- 3.0V to 3.6V, -40°C to +85°C, DC to 50 MIPS
- 3.0V to 3.6V, -40°C to +125°C, DC to 40 MIPS

### Core: 16-Bit dsPIC33F

- Code-Efficient (C and Assembly) Architecture
- Two 40-Bit Wide Accumulators
- Single-Cycle (MAC/MPY) with Dual Data Fetch
- Single-Cycle Mixed-Sign MUL plus Hardware Divide
- 32-Bit Multiply Support

### Clock Management

- $\pm 1\%$  Internal Oscillator
- Programmable PLLs and Oscillator Clock Sources
- Fail-Safe Clock Monitor (FSCM)
- Independent Watchdog Timer (WDT)
- Fast Wake-up and Start-up

### Power Management

- Low-Power Management modes (Sleep, Idle, Doze)
- Integrated Power-on Reset and Brown-out Reset
- 1.7 mA/MHz Dynamic Current (typical)
- 50  $\mu$ A IPD Current (typical)

### High-Speed PWM

- Up to 9 PWM Pairs with Independent Timing
- Dead Time for Rising and Falling Edges
- 1.04 ns PWM Resolution
- PWM Support for:
  - DC/DC, AC/DC, Inverters, PFC, Lighting
  - BLDC, PMSM, ACIM, SRM
- Programmable Fault Inputs
- Flexible Trigger Configurations for ADC Conversions

### Advanced Analog Features

- High-Speed ADC module:
  - 10-bit resolution with up to two Successive Approximation Register (SAR) converters (up to 4 Msps)
  - Up to 24 input channels grouped into 12 conversion pairs plus two voltage reference monitoring inputs
  - Dedicated result buffer for each analog channel
- Flexible and Independent ADC Trigger Sources
- Up to 4 High-Speed Comparators with Direct Connection to the PWM module:
  - 10-bit Digital-to-Analog Converter (DAC) for each comparator
  - DAC reference output
  - Programmable references with 1024 voltage points

### Timers/Output Compare/Input Capture

- Six General Purpose Timers:
  - Five 16-bit and up to two 32-bit timers/counters
- Four Output Compare (OC) modules Configurable as Timers/Counters
- Quadrature Encoder Interface (QEI) module Configurable as Timer/Counter
- Four Input Capture (IC) modules

### Communication Interfaces

- Two UART modules (12.5 Mbps):
  - With support for LIN/J2602 2.0 protocols and IrDA®
- Two 4-wire SPI modules (15 Mbps)
- ECAN™ module (1 Mbaud) CAN 2.0B Support
- Two I²C™ modules (up to 1 Mbaud) with SMBus Support

### Direct Memory Access (DMA)

- 4-Channel DMA with User-Selectable Priority Arbitration
- UART, SPI, ECAN™, IC, OC and Timers

### Input/Output

- Sink/Source 18 mA on 18 Pins, 10 mA on 1 Pin or 6 mA on 66 Pins
- 5V Tolerant Pins
- Selectable Open-Drain and Pull-ups
- 29 External Interrupts

### Qualification and Class B Support

- AEC-Q100 REVG (Grade 1 -40°C to +125°C)
- Class B Safety Library, IEC 60730, VDE Certified

### Debugger Development Support

- In-Circuit and In-Application Programming
- Two Program and two Complex Data Breakpoints
- IEEE 1149.2 Compatible (JTAG) Boundary Scan
- Trace and Run-Time Watch

# dsPIC33FJ32GS406/606/608/610 and dsPIC33FJ64GS406/606/608/610

## dsPIC33FJ32GS406/606/608/610 and dsPIC33FJ64GS406/606/608/610 PRODUCT FAMILIES

The device names, pin counts, memory sizes, and peripheral availability of each device are listed in [Table 1](#). The following pages show their pinout diagrams.

**TABLE 1: dsPIC33FJ32GS406/606/608/610 and dsPIC33FJ64GS406/606/608/610  
CONTROLLER FAMILIES**

| Device           | Pins | Program Flash Memory (Kbytes) | RAM (Bytes)       | 16-Bit Timer | Input Capture | Output Compare | UART | Quadrature Encoder Interface | SPI | ECAN™ | DMA Channels | PWM | Analog Comparator | External Interrupts | DAC Output | I²C™ | ADC  |                               |                          | I/O Pins | Packages |
|------------------|------|-------------------------------|-------------------|--------------|---------------|----------------|------|------------------------------|-----|-------|--------------|-----|-------------------|---------------------|------------|------|------|-------------------------------|--------------------------|----------|----------|
|                  |      |                               |                   |              |               |                |      |                              |     |       |              |     |                   |                     |            |      | SARs | Sample-and-Hold (S&H) Circuit | Analog-to-Digital Inputs |          |          |
| dsPIC33FJ32GS406 | 64   | 32                            | 4K                | 5            | 4             | 4              | 2    | 1                            | 2   | 0     | 0            | 6x2 | 0                 | 5                   | 0          | 2    | 1    | 5                             | 16                       | 58       | PT, MR   |

## TO OUR VALUED CUSTOMERS

It is our intention to provide our valued customers with the best documentation possible to ensure successful use of your Microchip products. To this end, we will continue to improve our publications to better suit your needs. Our publications will be refined and enhanced as new volumes and updates are introduced.

If you have any questions or comments regarding this publication, please contact the Marketing Communications Department via E-mail at [docerrors@microchip.com](mailto:docerrors@microchip.com) or fax the **Reader Response Form** in the back of this data sheet to (480) 792-4150. We welcome your feedback.

### Most Current Data Sheet

To obtain the most up-to-date version of this data sheet, please register at our Worldwide Web site at:

<http://www.microchip.com>

You can determine the version of a data sheet by examining its literature number found on the bottom outside corner of any page. The last character of the literature number is the version number, (e.g., DS30000A is version A of document DS30000).

### Errata

An errata sheet, describing minor operational differences from the data sheet and recommended workarounds, may exist for current devices. As device/documentation issues become known to us, we will publish an errata sheet. The errata will specify the revision of silicon and revision of document to which it applies.

To determine if an errata sheet exists for a particular device, please check with one of the following:

- Microchip's Worldwide Web site; <http://www.microchip.com>
- Your local Microchip sales office (see last page)

When contacting a sales office, please specify which device, revision of silicon and data sheet (include literature number) you are using.

### Customer Notification System

Register on our web site at [www.microchip.com](http://www.microchip.com) to receive the most current information on all of our products.

## Referenced Sources

This device data sheet is based on the following individual chapters of the “*dsPIC33F/PIC24H Family Reference Manual*”. These documents should be considered as the primary reference for the operation of a particular module or device feature.

**Note 1:** To access the documents listed below, browse to the documentation section of the [dsPIC33FJ64GS610](#) product page of the Microchip web site ([www.microchip.com](http://www.microchip.com)) to select a family reference manual section from the following list.

In addition to parameters, features, and other documentation, the resulting page provides links to the related family reference manual sections.

- **Section 2. “CPU”** (DS70204)
- **Section 3. “Data Memory”** (DS70202)
- **Section 4. “Program Memory”** (DS70203)
- **Section 5. “Flash Programming”** (DS70191)
- **Section 8. “Reset”** (DS70192)
- **Section 9. “Watchdog Timer and Power-Saving Modes”** (DS70196)
- **Section 10. “I/O Ports”** (DS70193)
- **Section 11. “Timers”** (DS70205)
- **Section 12. “Input Capture”** (DS70198)
- **Section 13. “Output Compare”** (DS70209)
- **Section 15. “Quadrature Encoder Interface (QEI)”** (DS70208)
- **Section 16. “Analog-to-Digital Converter (ADC)”** (DS70183)
- **Section 17. “UART”** (DS70188)
- **Section 18. “Serial Peripheral Interface (SPI)”** (DS70206)
- **Section 19. “Inter-Integrated Circuit™ (I²C™)”** (DS70195)
- **Section 21. “Enhanced Controller Area Network (ECAN™)”** (DS70185)
- **Section 22. “Direct Memory Access (DMA)”** (DS70182)
- **Section 23. “CodeGuard Security”** (DS70199)
- **Section 24. “Programming and Diagnostics”** (DS70207)
- **Section 25. “Device Configuration”** (DS70194)
- **Section 26. “Development Tool Support”** (DS70200)
- **Section 42. “Oscillator (Part IV)”** (DS70307)
- **Section 43. “High-Speed PWM”** (DS70323)
- **Section 44. “High-Speed 10-Bit Analog-to-Digital Converter (ADC)”** (DS70321)
- **Section 45. “High-Speed Analog Comparator”** (DS70296)
- **Section 47. “Interrupts (Part V)”** (DS70597)

NOTES:

## 1.0 DEVICE OVERVIEW

**Note:** This data sheet summarizes the features of the dsPIC33FJ32GS406/606/608/610 and dsPIC33FJ64GS406/606/608/610 families of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to the latest sections in the “*dsPIC33F/PIC24H Family Reference Manual*”, which are available from the Microchip web site ([www.microchip.com](http://www.microchip.com)).

The dsPIC33FJ32GS406/606/608/610 and dsPIC33FJ64GS406/606/608/610 families of devices contain extensive Digital Signal Processor (DSP) functionality with a high-performance 16-bit microcontroller (MCU) architecture.

Figure 1-1 shows a general block diagram of the core and peripheral modules in the dsPIC33FJ32GS406/606/608/610 and dsPIC33FJ64GS406/606/608/610 devices. Table 1-1 lists the functions of the various pins shown in the pinout diagrams.

This document contains device-specific information for the following dsPIC33F Digital Signal Controller (DSC) devices:

- dsPIC33FJ32GS406
- dsPIC33FJ32GS606
- dsPIC33FJ32GS608
- dsPIC33FJ32GS610
- dsPIC33FJ64GS406
- dsPIC33FJ64GS606
- dsPIC33FJ64GS608
- dsPIC33FJ64GS610

NOTES:

## 2.0 GUIDELINES FOR GETTING STARTED WITH 16-BIT DIGITAL SIGNAL CONTROLLERS

**Note 1:** This data sheet summarizes the features of the dsPIC33FJ32GS406/606/608/610 and dsPIC33FJ64GS406/606/608/610 family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to the “dsPIC33F/PIC24H Family Reference Manual”. Please see the Microchip web site ([www.microchip.com](http://www.microchip.com)) for the latest dsPIC33F/PIC24H Family Reference Manual sections.

**2:** Some registers and associated bits described in this section may not be available on all devices. Refer to [Section 4.0 “Memory Organization”](#) in this data sheet for device-specific register and bit information.

### 2.1 Basic Connection Requirements

Getting started with the dsPIC33FJ32GS406/606/608/610 and dsPIC33FJ64GS406/606/608/610 family of 16-bit Digital Signal Controllers (DSC) requires attention to a minimal set of device pin connections before proceeding with development. The following is a list of pin names, which must always be connected:

- All VDD and VSS pins (see [Section 2.2 “Decoupling Capacitors”](#))
- All AVDD and AVSS pins (regardless if ADC module is not used) (see [Section 2.2 “Decoupling Capacitors”](#))
- VCAP (see [Section 2.3 “Capacitor on Internal Voltage Regulator \(VCAP\)”](#))
- MCLR pin (see [Section 2.4 “Master Clear \(MCLR\) Pin”](#))
- PGECx/PGEDx pins used for In-Circuit Serial Programming™ (ICSP™) and debugging purposes (see [Section 2.5 “ICSP Pins”](#))
- OSC1 and OSC2 pins when external oscillator source is used (see [Section 2.6 “External Oscillator Pins”](#))

### 2.2 Decoupling Capacitors

The use of decoupling capacitors on every pair of power supply pins, such as VDD, VSS, AVDD, and AVSS is required.

Consider the following criteria when using decoupling capacitors:

- **Value and type of capacitor:** Recommendation of 0.1  $\mu$ F (100 nF), 10-20V. This capacitor should be a low-ESR and have resonance frequency in the range of 20 MHz and higher. It is recommended that ceramic capacitors be used.
- **Placement on the printed circuit board:** The decoupling capacitors should be placed as close to the pins as possible. It is recommended to place the capacitors on the same side of the board as the device. If space is constricted, the capacitor can be placed on another layer on the PCB using a via; however, ensure that the trace length from the pin to the capacitor is within one-quarter inch (6 mm) in length.
- **Handling high-frequency noise:** If the board is experiencing high-frequency noise, upward of tens of MHz, add a second ceramic-type capacitor in parallel to the above described decoupling capacitor. The value of the second capacitor can be in the range of 0.01  $\mu$ F to 0.001  $\mu$ F. Place this second capacitor next to the primary decoupling capacitor. In high-speed circuit designs, consider implementing a decade pair of capacitances as close to the power and ground pins as possible. For example, 0.1  $\mu$ F in parallel with 0.001  $\mu$ F.
- **Maximizing performance:** On the board layout from the power supply circuit, run the power and return traces to the decoupling capacitors first, and then to the device pins. This ensures that the decoupling capacitors are first in the power chain. Equally important is to keep the trace length between the capacitor and the power pins to a minimum, thereby reducing PCB track inductance.

**FIGURE 2-1: RECOMMENDED MINIMUM CONNECTION**

### 2.2.1 TANK CAPACITORS

On boards with power traces running longer than six inches in length, it is suggested to use a tank capacitor for integrated circuits including DSCs to supply a local power source. The value of the tank capacitor should be determined based on the trace resistance that connects the power supply source to the device, and the maximum current drawn by the device in the application. In other words, select the tank capacitor so that it meets the acceptable voltage sag at the device. Typical values range from 4.7 µF to 47 µF.

### 2.3 Capacitor on Internal Voltage Regulator (VCAP)

A low-ESR (< 0.5 Ohms) capacitor is required on the VCAP pin, which is used to stabilize the voltage regulator output voltage. The VCAP pin must not be connected to VDD, and must have a minimum capacitor 22 µF, 16V connected to ground. The type can be ceramic or tantalum. Refer to [Section 27.0 “Electrical Characteristics”](#) for additional information.

The placement of this capacitor should be close to the VCAP. It is recommended that the trace length not exceed one-quarter inch (6 mm). Refer to [Section 24.2 “On-Chip Voltage Regulator”](#) for details.

### 2.4 Master Clear (MCLR) Pin

The MCLR pin provides for two specific device functions:

- Device Reset
- Device programming and debugging

During device programming and debugging, the resistance and capacitance that can be added to the pin must be considered. Device programmers and debuggers drive the MCLR pin. Consequently, specific voltage levels (V<sub>IH</sub> and V<sub>IL</sub>) and fast signal transitions must not be adversely affected. Therefore, specific values of R and C will need to be adjusted based on the application and PCB requirements.

For example, as shown in [Figure 2-2](#), it is recommended that the capacitor C, be isolated from the MCLR pin during programming and debugging operations.

Place the components shown in [Figure 2-2](#) within one-quarter inch (6 mm) from the MCLR pin.

**FIGURE 2-2: EXAMPLE OF MCLR PIN CONNECTIONS<sup>(1,2)</sup>**

## 2.5 ICSP Pins

The PGECx and PGEDx pins are used for In-Circuit Serial Programming™ (ICSP™) and debugging purposes. It is recommended to keep the trace length between the ICSP connector and the ICSP pins on the device as short as possible. If the ICSP connector is expected to experience an ESD event, a series resistor is recommended, with the value in the range of a few tens of Ohms, not to exceed 100 Ohms.

Pull-up resistors, series diodes, and capacitors on the PGECx and PGEDx pins are not recommended as they will interfere with the programmer/debugger communications to the device. If such discrete components are an application requirement, they should be removed from the circuit during programming and debugging. Alternatively, refer to the AC/DC characteristics and timing requirements information in the respective device Flash programming specification for information on capacitive loading limits and pin input voltage high (V<sub>IH</sub>) and input low (V<sub>IL</sub>) requirements.

Ensure that the “Communication Channel Select” (i.e., PGECx/PGEDx pins) programmed into the device matches the physical connections for the ICSP to MPLAB® ICD 3 or MPLAB REAL ICE™.

For more information on ICD 3 and REAL ICE connection requirements, refer to the following documents that are available on the Microchip web site.

- “Using MPLAB® ICD 3” (poster) (DS51765)
- “MPLAB® ICD 3 Design Advisory” (DS51764)
- “MPLAB® REAL ICE™ In-Circuit Debugger User’s Guide” (DS51616)
- “Using MPLAB® REAL ICE™” (poster) (DS51749)

## 2.6 External Oscillator Pins

Many DSCs have options for at least two oscillators: a high-frequency primary oscillator and a low-frequency secondary oscillator (refer to [Section 9.0 “Oscillator Configuration”](#) for details).

The oscillator circuit should be placed on the same side of the board as the device. Also, place the oscillator circuit close to the respective oscillator pins, not exceeding one-half inch (12 mm) distance between them. The load capacitors should be placed next to the oscillator itself, on the same side of the board. Use a grounded copper pour around the oscillator circuit to isolate them from surrounding circuits. The grounded copper pour should be routed directly to the MCU ground. Do not run any signal traces or power traces inside the ground pour. Also, if using a two-sided board, avoid any traces on the other side of the board where the crystal is placed. A suggested layout is shown in [Figure 2-3](#).

**FIGURE 2-3: SUGGESTED PLACEMENT OF THE OSCILLATOR CIRCUIT**

## 2.7 Oscillator Value Conditions on Device Start-up

If the PLL of the target device is enabled and configured for the device start-up oscillator, the maximum oscillator source frequency must be limited to  $4\text{ MHz} < F_{\text{IN}} < 8\text{ MHz}$  to comply with device PLL start-up conditions. This means that if the external oscillator frequency is outside this range, the application must start-up in the FRC mode first. The default PLL settings after a POR with an oscillator frequency outside this range will violate the device operating speed.

Once the device powers up, the application firmware can initialize the PLL SFRs, CLKDIV, and PLLDBF to a suitable value, and then perform a clock switch to the Oscillator + PLL clock source. Note that clock switching must be enabled in the device Configuration Word.

## 2.8 Configuration of Analog and Digital Pins During ICSP Operations

If MPLAB ICD 3 or REAL ICE is selected as a debugger, it automatically initializes all of the Analog-to-Digital input pins (ANx) as “digital” pins, by setting all bits in the ADPCFG and ADPCFG2 registers.

The bits in the registers that correspond to the analog-to-digital pins that are initialized by MPLAB ICD 2, ICD 3, or REAL ICE, must not be cleared by the user application firmware; otherwise, communication errors will result between the debugger and the device.

If your application needs to use certain analog-to-digital pins as analog input pins during the debug session, the user application must clear the corresponding bits in the ADPCFG and ADPCFG2 registers during initialization of the ADC module.

When MPLAB ICD 3 or REAL ICE is used as a programmer, the user application firmware must correctly configure the ADPCFG and ADPCFG2 registers. Automatic initialization of these registers is only done during debugger operation. Failure to correctly configure the register(s) will result in all analog-to-digital pins being recognized as analog input pins, resulting in the port value being read as a logic ‘0’, which may affect user application functionality.

## 2.9 Unused I/Os

Unused I/O pins should be configured as outputs and driven to a logic low state.

Alternatively, connect a 1k to 10k resistor between Vss and unused pins and drive the output to logic low.

## 2.10 Typical Application Connection Examples

Examples of typical application connections are shown in [Figure 2-4](#) through [Figure 2-11](#).

### 3.0 CPU

**Note 1:** This data sheet summarizes the features of the dsPIC33FJ32GS406/606/608/610 and dsPIC33FJ64GS406/606/608/610 families of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 2. “CPU”** (DS70204) in the “dsPIC33F/PIC24H Family Reference Manual”, which is available from the Microchip web site ([www.microchip.com](http://www.microchip.com)).

**2:** Some registers and associated bits described in this section may not be available on all devices. Refer to **Section 4.0 “Memory Organization”** in this data sheet for device-specific register and bit information.

The dsPIC33FJ32GS406/606/608/610 and dsPIC33FJ64GS406/606/608/610 CPU module has a 16-bit (data) modified Harvard architecture with an enhanced instruction set, including significant support for DSP. The CPU has a 24-bit instruction word with a variable length opcode field. The Program Counter (PC) is 23 bits wide and addresses up to 4M x 24 bits of user program memory space. The actual amount of program memory implemented varies from device to device. A single-cycle instruction prefetch mechanism is used to help maintain throughput and provides predictable execution. All instructions execute in a single cycle, with the exception of instructions that change the program flow, the double-word move (`MOV.D`) instruction and the table instructions. Overhead-free program loop constructs are supported using the `DO` and `REPEAT` instructions, both of which are interruptible at any point.

The dsPIC33FJ32GS406/606/608/610 and dsPIC33FJ64GS406/606/608/610 devices have sixteen, 16-bit working registers in the programmer's model. Each of the working registers can serve as a data, address or address offset register. The sixteenth working register (W15) operates as a Software Stack Pointer (SP) for interrupts and calls.

There are two classes of instruction in the dsPIC33FJ32GS406/606/608/610 and dsPIC33FJ64GS406/606/608/610 devices: MCU and DSP. These two instruction classes are seamlessly integrated into a single CPU. The instruction set includes many addressing modes and is designed for optimum C compiler efficiency. For most instructions, the dsPIC33FJ32GS406/606/608/610 and dsPIC33FJ64GS406/606/608/610 is capable of executing a data (or program data) memory read, a working register (data) read, a data memory write and a program (instruction) memory read per instruction cycle. As a result, three parameter instructions can be supported, allowing  $A + B = C$  operations to be executed in a single cycle.

A block diagram of the CPU is shown in [Figure 3-1](#), and the programmer's model for the dsPIC33FJ32GS406/606/608/610 and dsPIC33FJ64GS406/606/608/610 is shown in [Figure 3-2](#).

#### 3.1 Data Addressing Overview

The data space can be addressed as 32K words or 64 Kbytes and is split into two blocks, referred to as X and Y data memory. Each memory block has its own independent Address Generation Unit (AGU). The MCU class of instructions operates solely through the X memory AGU, which accesses the entire memory map as one linear data space. Certain DSP instructions operate through the X and Y AGUs to support dual operand reads, which splits the data address space into two parts. The X and Y data space boundary is device-specific.

Overhead-free circular buffers (Modulo Addressing mode) are supported in both X and Y address spaces. The Modulo Addressing removes the software boundary checking overhead for DSP algorithms. Furthermore, the X AGU circular addressing can be used with any of the MCU class of instructions. The X AGU also supports Bit-Reversed Addressing to greatly simplify input or output data reordering for radix-2 FFT algorithms.

The upper 32 Kbytes of the data space memory map can optionally be mapped into program space at any 16K program word boundary defined by the 8-bit Program Space Visibility Page (PSVPAG) register. The program-to-data space mapping feature lets any instruction access program space as if it were data space.

#### 3.2 DSP Engine Overview

The DSP engine features a high-speed, 17-bit by 17-bit multiplier, a 40-bit ALU, two 40-bit saturating accumulators and a 40-bit bidirectional barrel shifter. The barrel shifter is capable of shifting a 40-bit value up to 16 bits, right or left, in a single cycle. The DSP instructions operate seamlessly with all other instructions and have been designed for optimal real-time performance. The `MAC` instruction and other associated instructions can concurrently fetch two data operands from memory while multiplying two W registers and accumulating and optionally saturating the result in the same cycle. This instruction functionality requires that the RAM data space be split for these instructions and linear for all others. Data space partitioning is achieved in a transparent and flexible manner through dedicating certain working registers to each address space.

## 3.3 Special MCU Features

The dsPIC33FJ32GS406/606/608/610 and dsPIC33FJ64GS406/606/608/610 features a 17-bit by 17-bit single-cycle multiplier that is shared by both the MCU ALU and DSP engine. The multiplier can perform signed, unsigned and mixed sign multiplication. Using a 17-bit by 17-bit multiplier for 16-bit by 16-bit multiplication not only allows you to perform mixed sign multiplication, it also achieves accurate results for special operations, such as  $(-1.0) \times (-1.0)$ .

The dsPIC33FJ32GS406/606/608/610 and dsPIC33FJ64GS406/606/608/610 supports 16/16 and 32/16 divide operations, both fractional and integer. All divide instructions are iterative operations. They must be executed within a REPEAT loop, resulting in a total execution time of 19 instruction cycles. The divide operation can be interrupted during any of those 19 cycles without loss of data.

A 40-bit barrel shifter is used to perform up to a 16-bit left or right shift in a single cycle. The barrel shifter can be used by both MCU and DSP instructions.

**Note 2:** The IPL3 bit is concatenated with the IPL<2:0> bits (SR<7:5>) to form the CPU Interrupt Priority Level.

### 3.5 Arithmetic Logic Unit (ALU)

The dsPIC33FJ32GS406/606/608/610 and dsPIC33FJ64GS406/606/608/610 ALU is 16 bits wide and is capable of addition, subtraction, bit shifts and logic operations. Unless otherwise mentioned, arithmetic operations are 2's complement in nature. Depending on the operation, the ALU can affect the values of the Carry (C), Zero (Z), Negative (N), Overflow (OV) and Digit Carry (DC) Status bits in the SR register. The C and DC Status bits operate as Borrow and Digit Borrow bits, respectively, for subtraction operations.

The ALU can perform 8-bit or 16-bit operations, depending on the mode of the instruction that is used. Data for the ALU operation can come from the W register array or data memory, depending on the addressing mode of the instruction. Likewise, output data from the ALU can be written to the W register array or a data memory location.

Refer to the “16-bit MCU and DSC Programmer's Reference Manual” (DS70157) for information on the SR bits affected by each instruction.

The dsPIC33FJ32GS406/606/608/610 and dsPIC33FJ64GS406/606/608/610 CPU incorporates hardware support for both multiplication and division. This includes a dedicated hardware multiplier and support hardware for 16-bit divisor division.

#### 3.5.1 MULTIPLIER

Using the high-speed, 17-bit x 17-bit multiplier of the DSP engine, the ALU supports unsigned, signed or mixed sign operation in several MCU multiplication modes:

- 16-bit x 16-bit signed
- 16-bit x 16-bit unsigned
- 16-bit signed x 5-bit (literal) unsigned
- 16-bit unsigned x 16-bit unsigned
- 16-bit unsigned x 5-bit (literal) unsigned
- 16-bit unsigned x 16-bit signed
- 8-bit unsigned x 8-bit unsigned

#### 3.5.2 DIVIDER

The divide block supports 32-bit/16-bit and 16-bit/16-bit signed and unsigned integer divide operations with the following data sizes:

- 32-bit signed/16-bit signed divide
- 32-bit unsigned/16-bit unsigned divide
- 16-bit signed/16-bit signed divide
- 16-bit unsigned/16-bit unsigned divide

The quotient for all divide instructions ends up in W0 and the remainder in W1. 16-bit signed and unsigned DIV instructions can specify any W register for both the 16-bit divisor (Wn) and any W register (aligned) pair (W(m+1):Wm) for the 32-bit dividend. The divide algorithm takes one cycle per bit of divisor, so both 32-bit/16-bit and 16-bit/16-bit instructions take the same number of cycles to execute.

### 3.6 DSP Engine

The DSP engine consists of a high-speed, 17-bit x 17-bit multiplier, a barrel shifter and a 40-bit adder/subtractor (with two target accumulators, round and saturation logic).

The dsPIC33FJ32GS406/606/608/610 and dsPIC33FJ64GS406/606/608/610 is a single-cycle instruction flow architecture; therefore, concurrent operation of the DSP engine with MCU instruction flow is not possible. However, some MCU ALU and DSP engine resources can be used concurrently by the same instruction (for example, ED, EDAC).

The DSP engine can also perform inherent accumulator-to-accumulator operations that require no additional data. These instructions are ADD, SUB and NEG.

The DSP engine has options selected through bits in the CPU Core Control register (CORCON), as listed below:

- Fractional or integer DSP multiply (IF)
- Signed or unsigned DSP multiply (US)
- Conventional or convergent rounding (RND)
- Automatic saturation on/off for ACCA (SATA)
- Automatic saturation on/off for ACCB (SATB)
- Automatic saturation on/off for writes to data memory (SATDW)
- Accumulator Saturation mode selection (ACCSAT)

A block diagram of the DSP engine is shown in Figure 3-3.

**TABLE 3-1: DSP INSTRUCTIONS SUMMARY**

| Instruction | Algebraic Operation | ACC Write Back |
|-------------|---------------------|----------------|
| CLR         | $A = 0$             | Yes            |
| ED          | $A = (x - y)^2$     | No             |
| EDAC        | $A = A + (x - y)^2$ | No             |
| MAC         | $A = A + (x * y)$   | Yes            |
| MAC         | $A = A + x^2$       | No             |
| MOVSAC      | No change in A      | Yes            |
| MPY         | $A = x * y$         | No             |
| MPY         | $A = x^2$           | No             |
| MPY.N       | $A = -x * y$        | No             |
| MSC         | $A = A - x * y$     | Yes            |

**FIGURE 3-3: DSP ENGINE BLOCK DIAGRAM**

### 3.6.1 MULTIPLIER

The 17-bit x 17-bit multiplier is capable of signed or unsigned operation and can multiplex its output using a scaler to support either 1.31 fractional (Q31) or 32-bit integer results. Unsigned operands are zero-extended into the 17th bit of the multiplier input value. Signed operands are sign-extended into the 17th bit of the multiplier input value. The output of the 17-bit x 17-bit multiplier/scaler is a 33-bit value that is sign-extended to 40 bits. Integer data is inherently represented as a signed 2's complement value, where the Most Significant bit (MSb) is defined as a sign bit. The range of an N-bit 2's complement integer is  $-2^{N-1}$  to  $2^{N-1} - 1$ .

- For a 16-bit integer, the data range is -32768 (0x8000) to 32767 (0x7FFF) including 0.
- For a 32-bit integer, the data range is -2,147,483,648 (0x8000 0000) to 2,147,483,647 (0x7FFF FFFF).

When the multiplier is configured for fractional multiplication, the data is represented as a 2's complement fraction, where the MSb is defined as a sign bit and the radix point is implied to lie just after the sign bit (QX format). The range of an N-bit 2's complement fraction with this implied radix point is  $-1.0$  to  $(1 - 2^{1-N})$ . For a 16-bit fraction, the Q15 data range is  $-1.0$  (0x8000) to  $0.999969482$  (0x7FFF) including 0 and has a precision of  $3.01518 \times 10^{-5}$ . In Fractional mode, the 16 x 16 multiply operation generates a 1.31 product that has a precision of  $4.65661 \times 10^{-10}$ .

The same multiplier is used to support the MCU multiply instructions, which include integer 16-bit signed, unsigned and mixed sign multiply operations.

The `MUL` instruction can be directed to use byte or word-sized operands. Byte operands will direct a 16-bit result, and word operands will direct a 32-bit result to the specified register(s) in the W array.

### 3.6.2 DATA ACCUMULATORS AND ADDER/SUBTRACTER

The data accumulator consists of a 40-bit adder/subtractor with automatic sign extension logic. It can select one of two accumulators (A or B) as its pre-accumulation source and post-accumulation destination. For the `ADD` and `LAC` instructions, the data to be accumulated or loaded can be optionally scaled using the barrel shifter prior to accumulation.

#### 3.6.2.1 Adder/Subtractor, Overflow and Saturation

The adder/subtractor is a 40-bit adder with an optional zero input into one side, and either true or complement data into the other input.

- In the case of addition, the Carry/Borrow input is active-high and the other input is true data (not complemented).
- In the case of subtraction, the Carry/Borrow input is active-low and the other input is complemented.

The adder/subtractor generates Overflow Status bits, SA/SB and OA/OB, which are latched and reflected in the STATUS register:

- Overflow from bit 39: this is a catastrophic overflow in which the sign of the accumulator is destroyed.
- Overflow into guard bits, 32 through 39: this is a recoverable overflow. This bit is set whenever all the guard bits are not identical to each other.

The adder has an additional saturation block that controls accumulator data saturation, if selected. It uses the result of the adder, the Overflow Status bits described previously and the `SAT<A:B>` (`CORCON<7:6>`) and `ACCSAT` (`CORCON<4>`) mode control bits to determine when and to what value to saturate.

Six STATUS register bits support saturation and overflow:

- OA: ACCA overflowed into guard bits
- OB: ACCB overflowed into guard bits
- SA: ACCA saturated (bit 31 overflow and saturation)  
or  
ACCA overflowed into guard bits and saturated (bit 39 overflow and saturation)
- SB: ACCB saturated (bit 31 overflow and saturation)  
or  
ACCB overflowed into guard bits and saturated (bit 39 overflow and saturation)
- OAB: Logical OR of OA and OB
- SAB: Logical OR of SA and SB

The OA and OB bits are modified each time data passes through the adder/subtractor. When set, they indicate that the most recent operation has overflowed into the accumulator guard bits (bits 32 through 39). The OA and OB bits can also optionally generate an arithmetic warning trap when set and the corresponding Overflow Trap Flag Enable bits (OVATE, OVBTE) in the INTCON1 register are set (refer to [Section 7.0 "Interrupt Controller"](#)). This allows the user application to take immediate action, for example, to correct system gain.

The SA and SB bits are modified each time data passes through the adder/subtractor, but can only be cleared by the user application. When set, they indicate that the accumulator has overflowed its maximum range (bit 31 for 32-bit saturation or bit 39 for 40-bit saturation) and will be saturated (if saturation is enabled). When saturation is not enabled, SA and SB default to bit 39 overflow and thus, indicate that a catastrophic overflow has occurred. If the COVTE bit in the INTCON1 register is set, SA and SB bits will generate an arithmetic warning trap when saturation is disabled.

The Overflow and Saturation Status bits can optionally be viewed in the STATUS Register (SR) as the logical OR of OA and OB (in bit OAB) and the logical OR of SA and SB (in bit SAB). Programmers can check one bit in the STATUS Register to determine if either accumulator has overflowed, or one bit to determine if either accumulator has saturated. This is useful for complex number arithmetic, which typically uses both accumulators.

The device supports three Saturation and Overflow modes:

- **Bit 39 Overflow and Saturation:**  
When bit 39 overflow and saturation occurs, the saturation logic loads the maximally positive 9.31 (0x7FFFFFFF) or maximally negative 9.31 value (0x80000000) into the target accumulator. The SA or SB bit is set and remains set until cleared by the user application. This condition is referred to as 'super saturation' and provides protection against erroneous data or unexpected algorithm problems (such as gain calculations).
- **Bit 31 Overflow and Saturation:**  
When bit 31 overflow and saturation occurs, the saturation logic then loads the maximally positive 1.31 value (0x007FFFFFFF) or maximally negative 1.31 value (0x00800000) into the target accumulator. The SA or SB bit is set and remains set until cleared by the user application. When this Saturation mode is in effect, the guard bits are not used, so the OA, OB or OAB bits are never set.
- **Bit 39 Catastrophic Overflow:**  
The bit 39 Overflow Status bit from the adder is used to set the SA or SB bit, which remains set until cleared by the user application. No saturation operation is performed, and the accumulator is allowed to overflow, destroying its sign. If the COVTE bit in the INTCON1 register is set, a catastrophic overflow can initiate a trap exception.

### 3.6.3 ACCUMULATOR 'WRITE BACK'

The MAC class of instructions (with the exception of MPY, MPY.N, ED and EDAC) can optionally write a rounded version of the high word (bits 31 through 16) of the accumulator that is not targeted by the instruction into data space memory. The write is performed across the X bus into combined X and Y address space. The following addressing modes are supported:

- **W13, Register Direct:**  
The rounded contents of the non-target accumulator are written into W13 as a 1.15 fraction.
- **[W13] + = 2, Register Indirect with Post-Increment:**  
The rounded contents of the non-target accumulator are written into the address pointed to by W13 as a 1.15 fraction. W13 is then incremented by 2 (for a word write).

#### 3.6.3.1 Round Logic

The round logic is a combinational block that performs a conventional (biased) or convergent (unbiased) round function during an accumulator write (store). The Round mode is determined by the state of the RND bit in the CORCON register. It generates a 16-bit, 1.15 data value that is passed to the data space write saturation logic. If rounding is not indicated by the instruction, a truncated 1.15 data value is stored and the least significant word is simply discarded.

Conventional rounding zero-extends bit 15 of the accumulator and adds it to the ACCxH word (bits 16 through 31 of the accumulator).

- If the ACCxL word (bits 0 through 15 of the accumulator) is between 0x8000 and 0xFFFF (0x8000 included), ACCxH is incremented.
- If ACCxL is between 0x0000 and 0x7FFF, ACCxH is left unchanged.

A consequence of this algorithm is that over a succession of random rounding operations, the value tends to be biased slightly positive.

Convergent (or unbiased) rounding operates in the same manner as conventional rounding, except when ACCxL equals 0x8000. In this case, the Least Significant bit (bit 16 of the accumulator) of ACCxH is examined:

- If it is '1', ACCxH is incremented.
- If it is '0', ACCxH is not modified.

Assuming that bit 16 is effectively random in nature, this scheme removes any rounding bias that may accumulate.

The SAC and SAC.R instructions store either a truncated (SAC), or rounded (SAC.R) version of the contents of the target accumulator to data memory via the X bus, subject to data saturation (see [Section 3.6.3.2 "Data Space Write Saturation"](#)). For the MAC class of instructions, the accumulator write-back operation functions in the same manner, addressing combined MCU (X and Y) data space through the X bus. For this class of instructions, the data is always subject to rounding.

### 3.6.3.2 Data Space Write Saturation

In addition to adder/subtractor saturation, writes to data space can also be saturated, but without affecting the contents of the source accumulator. The data space write saturation logic block accepts a 16-bit, 1.15 fractional value from the round logic block as its input, together with overflow status from the original source (accumulator) and the 16-bit round adder. These inputs are combined and used to select the appropriate 1.15 fractional value as output to write to data space memory.

If the SATDW bit in the CORCON register is set, data (after rounding or truncation) is tested for overflow and adjusted accordingly:

- For input data greater than 0x007FFF, data written to memory is forced to the maximum positive 1.15 value, 0x7FFF.
- For input data less than 0xFF8000, data written to memory is forced to the maximum negative 1.15 value, 0x8000.

The Most Significant bit of the source (bit 39) is used to determine the sign of the operand being tested.

If the SATDW bit in the CORCON register is not set, the input data is always passed through unmodified under all conditions.

### 3.6.4 BARREL SHIFTER

The barrel shifter can perform up to 16-bit arithmetic or logic right shifts, or up to 16-bit left shifts in a single cycle. The source can be either of the two DSP accumulators or the X bus (to support multi-bit shifts of register or memory data).

The shifter requires a signed binary value to determine both the magnitude (number of bits) and direction of the shift operation. A positive value shifts the operand right. A negative value shifts the operand left. A value of '0' does not modify the operand.

The barrel shifter is 40 bits wide, thereby obtaining a 40-bit result for DSP shift operations and a 16-bit result for MCU shift operations. Data from the X bus is presented to the barrel shifter between bit positions 16 and 31 for right shifts, and between bit positions 0 and 16 for left shifts.

NOTES:

## 4.0 MEMORY ORGANIZATION

**Note:** This data sheet summarizes the features of the dsPIC33FJ32GS406/606/608/610 and dsPIC33FJ64GS406/606/608/610 families of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to the *dsPIC33F/PIC24H Family Reference Manual*, “Section 4. Program Memory” (DS70203), which is available from the Microchip web site ([www.microchip.com](http://www.microchip.com)).

The dsPIC33FJ32GS406/606/608/610 and dsPIC33FJ64GS406/606/608/610 architecture features separate program and data memory spaces and buses. This architecture also allows the direct access to program memory from the data space during code execution.

## 4.1 Program Address Space

The program address memory space is 4M instructions. The space is addressable by a 24-bit value derived either from the 23-bit Program Counter (PC) during program execution, or from table operation or data space remapping as described in [Section 4.6 “Interfacing Program and Data Memory Spaces”](#).

User application access to the program memory space is restricted to the lower half of the address range (0x000000 to 0x7FFFFFFF). The exception is the use of TBLRD/TBLWT operations, which use TBLPAG<7> to permit access to the Configuration bits and Device ID sections of the configuration memory space.

The memory maps are shown in [Figure 4-1](#).

**FIGURE 4-1: PROGRAM MEMORY MAPS FOR dsPIC33FJ32GS406/606/608/610 and dsPIC33FJ64GS406/606/608/610 DEVICES**

4.1.1 PROGRAM MEMORY ORGANIZATION

The program memory space is organized in word-addressable blocks. Although it is treated as 24 bits wide, it is more appropriate to think of each address of the program memory as a lower and upper word, with the upper byte of the upper word being unimplemented. The lower word always has an even address, while the upper word has an odd address (see [Figure 4-2](#)).

Program memory addresses are always word-aligned on the lower word, and addresses are incremented or decremented by two during the code execution. This arrangement provides compatibility with data memory space addressing and makes data in the program memory space accessible.

4.1.2 INTERRUPT AND TRAP VECTORS

All dsPIC33FJ32GS406/606/608/610 and dsPIC33FJ64GS406/606/608/610 devices reserve the addresses between 0x00000 and 0x000200 for hard-coded program execution vectors. A hardware Reset vector is provided to redirect code execution from the default value of the PC on device Reset to the actual start of code. A GOTO instruction is programmed by the user application at 0x000000, with the actual address for the start of code at 0x000002.

The dsPIC33FJ32GS406/606/608/610 and dsPIC33FJ64GS406/606/608/610 devices also have two Interrupt Vector Tables (IVT), located from 0x000004 to 0x0000FF and 0x000100 to 0x0001FF. These vector tables allow each of the device interrupt sources to be handled by separate Interrupt Service Routines (ISRs). A more detailed discussion of the Interrupt Vector Tables is provided in [Section 7.1 “Interrupt Vector Table”](#).

FIGURE 4-2: PROGRAM MEMORY ORGANIZATION

## 4.2 Data Address Space

The CPU has a separate 16-bit-wide data memory space. The data space is accessed using separate Address Generation Units (AGUs) for read and write operations. The data memory maps is shown in [Figure 4-3](#).

All Effective Addresses (EAs) in the data memory space are 16 bits wide and point to bytes within the data space. This arrangement gives a data space address range of 64 Kbytes or 32K words. The lower half of the data memory space (that is, when  $EA<15> = 0$ ) is used for implemented memory addresses, while the upper half ( $EA<15> = 1$ ) is reserved for the Program Space Visibility area (see [Section 4.6.3 “Reading Data from Program Memory Using Program Space Visibility”](#)).

The dsPIC33FJ32GS406/606/608/610 and dsPIC33FJ64GS406/606/608/610 devices implement up to 9 Kbytes of data memory. Should an EA point to a location outside of this area, an all-zero word or byte will be returned.

### 4.2.1 DATA SPACE WIDTH

The data memory space is organized in byte addressable, 16-bit wide blocks. Data is aligned in data memory and registers as 16-bit words, but all data space EAs resolve to bytes. The Least Significant Bytes (LSBs) of each word have even addresses, while the Most Significant Bytes (MSBs) have odd addresses.

### 4.2.2 DATA MEMORY ORGANIZATION AND ALIGNMENT

To maintain backward compatibility with PIC® MCU devices and improve data space memory usage efficiency, the instruction set supports both word and byte operations. As a consequence of byte accessibility, all Effective Address calculations are internally scaled to step through word-aligned memory. For example, the core recognizes that Post-Modified Register Indirect Addressing mode [Ws++] that results in a value of Ws + 1 for byte operations and Ws + 2 for word operations.

Data byte reads will read the complete word that contains the byte, using the LSB of any EA to determine which byte to select. The selected byte is placed onto the LSB of the data path. That is, data memory and registers are organized as two parallel byte-wide entities with shared (word) address decode but separate write lines. Data byte writes only write to the corresponding side of the array or register that matches the byte address.

All word accesses must be aligned to an even address. Misaligned word data fetches are not supported, so care must be taken when mixing byte and word operations, or translating from 8-bit MCU code. If a misaligned read or write is attempted, an address error trap is generated. If the error occurred on a read, the instruction underway is completed. If the error occurred on a write, the instruction is executed but the write does not occur. In either case, a trap is then executed, allowing the system and/or user application to examine the machine state prior to execution of the address Fault.

All byte loads into any W register are loaded into the Least Significant Byte. The Most Significant Byte is not modified.

A Sign-Extend (SE) instruction is provided to allow user applications to translate 8-bit signed data to 16-bit signed values. Alternatively, for 16-bit unsigned data, user applications can clear the MSB of any W register by executing a Zero-Extend (ZE) instruction on the appropriate address.

### 4.2.3 SFR SPACE

The first 2 Kbytes of the Near Data Space, from 0x0000 to 0x07FF, is primarily occupied by Special Function Registers (SFRs). These are used by the core and peripheral modules for controlling the operation of the device.

SFRs are distributed among the modules that they control, and are generally grouped together by module. Much of the SFR space contains unused addresses; these are read as '0'.

|                                                                                                                                                                                       |
|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Note:</b> The actual set of peripheral features and interrupts varies by the device. Refer to the corresponding device tables and pinout diagrams for device-specific information. |
|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

### 4.2.4 NEAR DATA SPACE

The 8-Kbyte area between 0x0000 and 0x1FFF is referred to as the Near Data Space. Locations in this space are directly addressable via a 13-bit absolute address field within all memory direct instructions. Additionally, the whole data space is addressable using MOV instructions, which support Memory Direct Addressing mode with a 16-bit address field, or by using Indirect Addressing mode using a working register as an Address Pointer.

FIGURE 4-3: DATA MEMORY MAP FOR DEVICES WITH 4-KBYTE RAM

**FIGURE 4-4: DATA MEMORY MAP FOR DEVICES WITH 8-KBYTE RAM**

FIGURE 4-5: DATA MEMORY MAP FOR DEVICES WITH 9-KBYTE RAM

#### 4.2.5 X AND Y DATA SPACES

The core has two data spaces, X and Y. These data spaces can be considered either separate (for some DSP instructions), or as one unified linear address range (for MCU instructions). The data spaces are accessed using two Address Generation Units (AGUs) and separate data paths. This feature allows certain instructions to concurrently fetch two words from RAM, thereby enabling efficient execution of DSP algorithms such as Finite Impulse Response (FIR) filtering and Fast Fourier Transform (FFT).

The X data space is used by all instructions and supports all addressing modes. X data space has separate read and write data buses. The X read data bus is the read data path for all instructions that view data space as combined X and Y address space. It is also the X data prefetch path for the dual operand DSP instructions (MAC class).

The Y data space is used in concert with the X data space by the MAC class of instructions (CLR, ED, EDAC, MAC, MOVSAC, MPY, MPY.N and MSC) to provide two concurrent data read paths.

Both the X and Y data spaces support Modulo Addressing mode for all instructions, subject to addressing mode restrictions. Bit-Reversed Addressing mode is only supported for writes to X data space.

All data memory writes, including in DSP instructions, view data space as combined X and Y address space. The boundary between the X and Y data spaces is device-dependent and is not user-programmable.

All Effective Addresses (EAs) are 16 bits wide and point to bytes within the data space. Therefore, the data space address range is 64 Kbytes, or 32K words, though the implemented memory locations vary by device.

#### 4.2.6 DMA RAM

Some devices contain 1 Kbyte of dual ported DMA RAM, which is located at the end of Y data space. Memory locations that are part of Y data RAM and are in the DMA RAM space are accessible simultaneously by the CPU and the DMA Controller module. DMA RAM is utilized by the DMA Controller to store data to be transferred to various peripherals using DMA, as well as data transferred from various peripherals using DMA. The DMA RAM can be accessed by the DMA Controller without having to steal cycles from the CPU.

When the CPU and the DMA Controller attempt to concurrently write to the same DMA RAM location, the hardware ensures that the CPU is given precedence in accessing the DMA RAM location. Therefore, the DMA RAM provides a reliable means of transferring DMA data without ever having to stall the CPU.

TABLE 4-1: CPU CORE REGISTER MAP

| SFR Name | SFR Addr. | Bit 15                            | Bit 14   | Bit 13   | Bit 12   | Bit 11   | Bit 10   | Bit 9    | Bit 8    | Bit 7                                                   | Bit 6 | Bit 5         | Bit 4 | Bit 3 | Bit 2 | Bit 1 | Bit 0 | All Resets |

#### 4.2.7 SOFTWARE STACK

In addition to its use as a working register, the W15 register in the dsPIC33FJ32GS406/606/608/610 and dsPIC33FJ64GS406/606/608/610 devices is also used as a Software Stack Pointer. The Stack Pointer always points to the first available free word and grows from lower to higher addresses. It predecrements for stack pops and post-increments for stack pushes, as shown in Figure 4-6. For a PC push during any `CALL` instruction, the MSb of the PC is zero-extended before the push, ensuring that the MSb is always clear.

**Note:** A PC push during exception processing concatenates the SRL register to the MSb of the PC prior to the push.

The Stack Pointer Limit register (SPLIM) associated with the Stack Pointer sets an upper address boundary for the stack. SPLIM is uninitialized at Reset. As is the case for the Stack Pointer, SPLIM<0> is forced to '0' because all stack operations must be word-aligned.

Whenever an EA is generated using W15 as a source or destination pointer, the resulting address is compared with the value in SPLIM. If the contents of the Stack Pointer (W15) and the SPLIM register are equal and a push operation is performed, a stack error trap will not occur. The stack error trap will occur on a subsequent push operation. For example, to cause a stack error trap when the stack grows beyond address 0x1800 in RAM, initialize the SPLIM with the value, 0x17FE.

Similarly, a Stack Pointer underflow (stack error) trap is generated when the Stack Pointer address is found to be less than 0x0800. This prevents the stack from interfering with the Special Function Register (SFR) space.

A write to the SPLIM register should not be immediately followed by an indirect read operation using W15.

**FIGURE 4-6: CALL STACK FRAME**

#### 4.3 Instruction Addressing Modes

The addressing modes shown in Table 4-66 form the basis of the addressing modes optimized to support the specific features of individual instructions. The addressing modes provided in the `MAC` class of instructions differ from those in the other instruction types.

##### 4.3.1 FILE REGISTER INSTRUCTIONS

Most file register instructions use a 13-bit address field (f) to directly address data present in the first 8192 bytes of data memory (Near Data Space). Most file register instructions employ a working register, W0, which is denoted as WREG in these instructions. The destination is typically either the same file register or WREG (with the exception of the `MUL` instruction), which writes the result to a register or register pair. The `MOV` instruction allows additional flexibility and can access the entire data space.

##### 4.3.2 MCU INSTRUCTIONS

The three-operand MCU instructions are of the form:

Operand 3 = Operand 1 <function> Operand 2

where Operand 1 is always a working register (that is, the addressing mode can only be register direct), which is referred to as Wb. Operand 2 can be a W register, fetched from data memory, or a 5-bit literal. The result location can be either a W register or a data memory location. The following addressing modes are supported by MCU instructions:

- Register Direct
- Register Indirect
- Register Indirect Post-Modified
- Register Indirect Pre-Modified
- 5-Bit or 10-Bit Literal

**Note:** Not all instructions support all the addressing modes given above. Individual instructions can support different subsets of these addressing modes.

TABLE 4-66: FUNDAMENTAL ADDRESSING MODES SUPPORTED

| Addressing Mode                                           | Description                                                                                            |
|-----------------------------------------------------------|--------------------------------------------------------------------------------------------------------|
| File Register Direct                                      | The address of the file register is specified explicitly.                                              |
| Register Direct                                           | The contents of a register are accessed directly.                                                      |
| Register Indirect                                         | The contents of Wn forms the Effective Address (EA).                                                   |
| Register Indirect Post-Modified                           | The contents of Wn forms the EA. Wn is post-modified (incremented or decremented) by a constant value. |
| Register Indirect Pre-Modified                            | Wn is pre-modified (incremented or decremented) by a signed constant value to form the EA.             |
| Register Indirect with Register Offset (Register Indexed) | The sum of Wn and Wb forms the EA.                                                                     |
| Register Indirect with Literal Offset                     | The sum of Wn and a literal forms the EA.                                                              |

#### 4.3.3 MOVE AND ACCUMULATOR INSTRUCTIONS

Move instructions and the DSP accumulator class of instructions provide a greater degree of addressing flexibility than other instructions. In addition to the addressing modes supported by most MCU instructions, move and accumulator instructions also support Register Indirect with Register Offset Addressing mode, also referred to as Register Indexed mode.

**Note:** For the `MOV` instructions, the addressing mode specified in the instruction can differ for the source and destination EA. However, the 4-bit Wb (Register Offset) field is shared by both source and destination (but typically only used by one).

In summary, the following addressing modes are supported by move and accumulator instructions:

- Register Direct
- Register Indirect
- Register Indirect Post-modified
- Register Indirect Pre-modified
- Register Indirect with Register Offset (Indexed)
- Register Indirect with Literal Offset
- 8-Bit Literal
- 16-Bit Literal

**Note:** Not all instructions support all the addressing modes given above. Individual instructions may support different subsets of these addressing modes.

#### 4.3.4 MAC INSTRUCTIONS

The dual source operand DSP instructions (`CLR`, `ED`, `EDAC`, `MAC`, `MPY`, `MPY.N`, `MOVSAC` and `MSC`), also referred to as `MAC` instructions, use a simplified set of addressing modes to allow the user application to effectively manipulate the Data Pointers through Register Indirect tables.

The two-source operand, prefetch registers must be members of the set: {W8, W9, W10, W11}. For data reads, W8 and W9 are always directed to the X RAGU, and W10 and W11 are always directed to the Y AGU. The Effective Addresses generated (before and after modification) must, therefore, be valid addresses within X data space for W8 and W9 and Y data space for W10 and W11.

**Note:** Register Indirect with Register Offset Addressing mode is available only for W9 (in X space) and W11 (in Y space).

In summary, the following addressing modes are supported by the `MAC` class of instructions:

- Register Indirect
- Register Indirect Post-Modified by 2
- Register Indirect Post-Modified by 4
- Register Indirect Post-Modified by 6
- Register Indirect with Register Offset (Indexed)

#### 4.3.5 OTHER INSTRUCTIONS

Besides the addressing modes outlined previously, some instructions use literal constants of various sizes. For example, `BRA` (branch) instructions use 16-bit signed literals to specify the branch destination directly, whereas the `DISI` instruction uses a 14-bit unsigned literal field. In some instructions, such as `ADD Acc`, the source of an operand or result is implied by the opcode itself. Certain operations, such as `NOP`, do not have any operands.

## 4.4 Modulo Addressing

Modulo Addressing mode is a method used to provide an automated means to support circular data buffers using hardware. The objective is to remove the need for software to perform data address boundary checks when executing tightly looped code, as is typical in many DSP algorithms.

Modulo Addressing can operate in either data or program space (since the Data Pointer mechanism is essentially the same for both). One circular buffer can be supported in each of the X (which also provides the pointers into program space) and Y data spaces. Modulo Addressing can operate on any W Register Pointer. However, it is not advisable to use W14 or W15 for Modulo Addressing since these two registers are used as the Stack Frame Pointer and Stack Pointer, respectively.

In general, any particular circular buffer can be configured to operate in only one direction as there are certain restrictions on the buffer start address (for incrementing buffers), or end address (for decrementing buffers), based upon the direction of the buffer.

The only exception to the usage restrictions is for buffers that have a power-of-two length. As these buffers satisfy the start and end address criteria, they can operate in a bidirectional mode (that is, address boundary checks are performed on both the lower and upper address boundaries).

### 4.4.1 START AND END ADDRESS

The Modulo Addressing scheme requires that a starting and ending address be specified and loaded into the 16-bit Modulo Buffer Address registers: XMODSRT, XMODEND, YMODSRT and YMODEND (see Table 4-1).

**Note:** Y Space Modulo Addressing EA calculations assume word-sized data (LSb of every EA is always clear).

The length of a circular buffer is not directly specified. It is determined by the difference between the corresponding start and end addresses. The maximum possible length of the circular buffer is 32K words (64 Kbytes).

### 4.4.2 W ADDRESS REGISTER SELECTION

The Modulo and Bit-Reversed Addressing Control register, MODCON<15:0>, contains enable flags as well as a W register field to specify the W Address registers. The XWM and YWM fields select the registers that will operate with Modulo Addressing:

- If XWM = 15, X RAGU and X WAGU Modulo Addressing is disabled.
- If YWM = 15, Y AGU Modulo Addressing is disabled.

The X Address Space Pointer W register (XWM), to which Modulo Addressing is to be applied, is stored in MODCON<3:0> (see Table 4-1). Modulo Addressing is enabled for X data space when XWM is set to any value other than '15' and the XMODEN bit is set at MODCON<15>.

The Y Address Space Pointer W register (YWM) to which Modulo Addressing is to be applied is stored in MODCON<7:4>. Modulo Addressing is enabled for Y data space when YWM is set to any value other than '15' and the YMODEN bit is set at MODCON<14>.

**FIGURE 4-7: MODULO ADDRESSING OPERATION EXAMPLE**

## 4.4.3 MODULO ADDRESSING APPLICABILITY

Modulo Addressing can be applied to the Effective Address (EA) calculation associated with any W register. Address boundaries check for addresses equal to:

- Upper boundary addresses for incrementing buffers
- Lower boundary addresses for decrementing buffers

It is important to realize that the address boundaries check for addresses less than or greater than the upper (for incrementing buffers) and lower (for decrementing buffers) boundary addresses (not just equal to). Address changes can, therefore, jump beyond boundaries and still be adjusted correctly.

**Note:** The modulo corrected Effective Address is written back to the register only when Pre-Modify or Post-Modify Addressing mode is used to compute the Effective Address. When an address offset (such as  $[W7 + W2]$ ) is used, Modulo Addressing correction is performed but the contents of the register remain unchanged.

## 4.5 Bit-Reversed Addressing

Bit-Reversed Addressing mode is intended to simplify data re-ordering for radix-2 FFT algorithms. It is supported by the X AGU for data writes only.

The modifier, which can be a constant value or register contents, is regarded as having its bit order reversed. The address source and destination are kept in normal order. Thus, the only operand requiring reversal is the modifier.

## 4.5.1 BIT-REVERSED ADDRESSING IMPLEMENTATION

Bit-Reversed Addressing mode is enabled in any of these situations:

- BWMx bits (W register selection) in the MODCON register are any value other than '15' (the stack cannot be accessed using Bit-Reversed Addressing)
- The BREN bit is set in the XBREV register
- The addressing mode used is Register Indirect with Pre-Increment or Post-Increment

If the length of a bit-reversed buffer is  $M = 2^N$  bytes, the last 'N' bits of the data buffer start address must be zeros.

XB<14:0> is the Bit-Reversed Addressing modifier, or 'pivot point,' which is typically a constant. In the case of an FFT computation, its value is equal to half of the FFT data buffer size.

**Note:** All bit-reversed EA calculations assume word-sized data (LSb of every EA is always clear). The XB value is scaled accordingly to generate compatible (byte) addresses.

When enabled, Bit-Reversed Addressing is executed only for Register Indirect with Pre-Increment or Post-Increment Addressing and word-sized data writes. It will not function for any other addressing mode or for byte-sized data, and normal addresses are generated instead. When Bit-Reversed Addressing is active, the W Address Pointer is always added to the address modifier (XB), and the offset associated with the Register Indirect Addressing mode is ignored. In addition, as word-sized data is a requirement, the LSb of the EA is ignored (and always clear).

**Note:** Modulo Addressing and Bit-Reversed Addressing should not be enabled together. If an application attempts to do so, Bit-Reversed Addressing will assume priority when active for the X WAGU and X WAGU, and Modulo Addressing will be disabled. However, Modulo Addressing will continue to function in the X AGU.

If Bit-Reversed Addressing has already been enabled by setting the BREN (XBREV<15>) bit, a write to the XBREV register should not be immediately followed by an indirect read operation using the W register that has been designated as the Bit-Reversed Pointer.

**FIGURE 4-8: BIT-REVERSED ADDRESS EXAMPLE**

**TABLE 4-67: BIT-REVERSED ADDRESS SEQUENCE (16-ENTRY)**

| Normal Address |    |    |    |         | Bit-Reversed Address |    |    |    |         |
|----------------|----|----|----|---------|----------------------|----|----|----|---------|
| A3             | A2 | A1 | A0 | Decimal | A3                   | A2 | A1 | A0 | Decimal |
| 0              | 0  | 0  | 0  | 0       | 0                    | 0  | 0  | 0  | 0       |
| 0              | 0  | 0  | 1  | 1       | 1                    | 0  | 0  | 0  | 8       |
| 0              | 0  | 1  | 0  | 2       | 0                    | 1  | 0  | 0  | 4       |
| 0              | 0  | 1  | 1  | 3       | 1                    | 1  | 0  | 0  | 12      |

## 4.6 Interfacing Program and Data Memory Spaces

The dsPIC33FJ32GS406/606/608/610 and dsPIC33FJ64GS406/606/608/610 architecture uses a 24-bit-wide program space and a 16-bit-wide data space. The architecture is also a modified Harvard scheme, meaning that data can also be present in the program space. To use this data successfully, it must be accessed in a way that preserves the alignment of information in both spaces.

Aside from normal execution, the dsPIC33FJ32GS406/606/608/610 and dsPIC33FJ64GS406/606/608/610 architecture provides two methods by which program space can be accessed during operation:

- Using table instructions to access individual bytes or words anywhere in the program space
- Remapping a portion of the program space into the data space (Program Space Visibility)

Table instructions allow an application to read or write to small areas of the program memory. This capability makes the method ideal for accessing data tables that need to be updated periodically. It also allows access to all bytes of the program word. The remapping method allows an application to access a large block of data on a read-only basis, which is ideal for look-ups from a large table of static data. The application can only access the least significant word of the program word.

### 4.6.1 ADDRESSING PROGRAM SPACE

Since the address ranges for the data and program spaces are 16 and 24 bits, respectively, a method is needed to create a 23-bit or 24-bit program address from 16-bit data registers. The solution depends on the interface method to be used.

For table operations, the 8-bit Table Page register (TBLPAG) is used to define a 32K word region within the program space. This is concatenated with a 16-bit EA to arrive at a full 24-bit program space address. In this format, the Most Significant bit of TBLPAG is used to determine if the operation occurs in the user memory (TBLPAG<7> = 0) or the configuration memory (TBLPAG<7> = 1).

For remapping operations, the 8-bit Program Space Visibility register (PSVPAG) is used to define a 16K word page in the program space. When the Most Significant bit of the EA is '1', PSVPAG is concatenated with the lower 15 bits of the EA to form a 23-bit program space address. Unlike table operations, this limits remapping operations strictly to the user memory area.

Table 4-68 and Figure 4-9 show how the program EA is created for table operations and remapping accesses from the data EA. Here, P<23:0> refers to a program space word and D<15:0> refers to a data space word.

**TABLE 4-68: PROGRAM SPACE ADDRESS CONSTRUCTION**

| Access Type                                    | Access Space  | Program Space Address                       |              |                              |                              |     |
|------------------------------------------------|---------------|---------------------------------------------|--------------|------------------------------|------------------------------|-----|
|                                                |               | <23>                                        | <22:16>      | <15>                         | <14:1>                       | <0> |
| Instruction Access<br>(Code Execution)         | User          | 0                                           | PC<22:1>     |                              |                              | 0   |
|                                                |               | 0xx    xxxx    xxxx    xxxx    xxxx    xxx0 |              |                              |                              |     |
| TBLRD/TBLWT<br>(Byte/Word Read/Write)          | User          | TBLPAG<7:0>                                 |              | Data EA<15:0>                |                              |     |
|                                                |               | 0xxx    xxxx                                |              | xxxx    xxxx    xxxx    xxxx |                              |     |
|                                                | Configuration | TBLPAG<7:0>                                 |              | Data EA<15:0>                |                              |     |
|                                                |               | 1xxx    xxxx                                |              | xxxx    xxxx    xxxx    xxxx |                              |     |
| Program Space Visibility<br>(Block Remap/Read) | User          | 0                                           | PSVPAG<7:0>  |                              | Data EA<14:0> <sup>(1)</sup> |     |
|                                                |               | 0                                           | xxxx    xxxx |                              | xxx    xxxx    xxxx    xxxx  |     |

**Note 1:** Data EA<15> is always '1' in this case, but is not used in calculating the program space address. Bit 15 of the address is PSVPAG<0>.

FIGURE 4-9: DATA ACCESS FROM PROGRAM SPACE ADDRESS GENERATION

#### 4.6.2 DATA ACCESS FROM PROGRAM MEMORY USING TABLE INSTRUCTIONS

The **TBLRDL** and **TBLWTL** instructions offer a direct method of reading or writing the lower word of any address within the program space without going through data space. The **TBLRDH** and **TBLWTH** instructions are the only method to read or write the upper 8 bits of a program space word as data.

The PC is incremented by two for each successive 24-bit program word. This allows program memory addresses to directly map to data space addresses. Program memory can thus be regarded as two 16-bit-wide word address spaces, residing side by side, each with the same address range. **TBLRDL** and **TBLWTL** access the space that contains the least significant data word. **TBLRDH** and **TBLWTH** access the space that contains the upper data byte.

Two table instructions are provided to move byte or word-sized (16-bit) data to and from program space. Both function as either byte or word operations.

- **TBLRDL** (Table Read Low):
  - In Word mode, this instruction maps the lower word of the program space location ( $P<15:0>$ ) to a data address ( $D<15:0>$ ).

- In Byte mode, either the upper or lower byte of the lower program word is mapped to the lower byte of a data address. The upper byte is selected when Byte Select is '1'; the lower byte is selected when it is '0'.

- **TBLRDH** (Table Read High):
  - In Word mode, this instruction maps the entire upper word of a program address ( $P<23:16>$ ) to a data address. Note that  $D<15:8>$ , the 'phantom byte', will always be '0'.
  - In Byte mode, this instruction maps the upper or lower byte of the program word to  $D<7:0>$  of the data address, in the **TBLRDL** instruction. The data is always '0' when the upper 'phantom' byte is selected (Byte Select = 1).

Similarly, two table instructions, **TBLWTH** and **TBLWTL**, are used to write individual bytes or words to a program space address. The details of their operation are explained in [Section 5.0 "Flash Program Memory"](#).

For all table operations, the area of program memory space to be accessed is determined by the Table Page register (TBLPAG). TBLPAG covers the entire program memory space of the device, including user and configuration spaces. When  $TBLPAG<7> = 0$ , the table page is located in the user memory space. When  $TBLPAG<7> = 1$ , the page is located in configuration space.

**FIGURE 4-10: ACCESSING PROGRAM MEMORY WITH TABLE INSTRUCTIONS**

#### 4.6.3 READING DATA FROM PROGRAM MEMORY USING PROGRAM SPACE VISIBILITY

The upper 32 Kbytes of data space may optionally be mapped into any 16K word page of the program space. This option provides transparent access to stored constant data from the data space without the need to use special instructions (such as `TBLRDH/L`).

Program space access through the data space occurs if the Most Significant bit of the data space EA is '1' and program space visibility is enabled by setting the PSV bit in the Core Control register (`CORCON<2>`). The location of the program memory space to be mapped into the data space is determined by the Program Space Visibility Page register (`PSVPAG`). This 8-bit register defines any one of 256 possible pages of 16K words in program space. In effect, `PSVPAG` functions as the upper 8 bits of the program memory address, with the 15 bits of the EA functioning as the lower bits. By incrementing the PC by 2 for each program memory word, the lower 15 bits of data space addresses directly map to the lower 15 bits in the corresponding program space addresses.

Data reads to this area add a cycle to the instruction being executed, since two program memory fetches are required.

Although each data space address 8000h and higher maps directly into a corresponding program memory address (see Figure 4-11), only the lower 16 bits of the

24-bit program word are used to contain the data. The upper 8 bits of any program space location used as data should be programmed with '1111 1111' or '0000 0000' to force a `NOE`. This prevents possible issues should the area of code ever be accidentally executed.

**Note:** PSV access is temporarily disabled during Table Reads/Writes.

For operations that use PSV and are executed outside a `REPEAT` loop, the `MOV` and `MOV.D` instructions require one instruction cycle in addition to the specified execution time. All other instructions require two instruction cycles in addition to the specified execution time.

For operations that use PSV and are executed inside a `REPEAT` loop, these instances require two instruction cycles in addition to the specified execution time of the instruction:

- Execution in the first iteration
- Execution in the last iteration
- Execution prior to exiting the loop due to an interrupt
- Execution upon re-entering the loop after an interrupt is serviced

Any other iteration of the `REPEAT` loop will allow the instruction using PSV to access data, to execute in a single cycle.

**FIGURE 4-11: PROGRAM SPACE VISIBILITY OPERATION**

NOTES:

## 5.0 FLASH PROGRAM MEMORY

**Note 1:** This data sheet summarizes the features of the dsPIC33FJ32GS406/606/608/610 and dsPIC33FJ64GS406/606/608/610 families of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 5. “Flash Programming”** (DS70191) in the “dsPIC33F/PIC24H Family Reference Manual”, which is available from the Microchip web site ([www.microchip.com](http://www.microchip.com)).

**2:** Some registers and associated bits described in this section may not be available on all devices. Refer to **Section 4.0 “Memory Organization”** in this data sheet for device-specific register and bit information.

The dsPIC33FJ32GS406/606/608/610 and dsPIC33FJ64GS406/606/608/610 devices contain internal Flash program memory for storing and executing application code. The memory is readable, writable and erasable during normal operation over the entire VDD range.

Flash memory can be programmed in two ways:

- In-Circuit Serial Programming™ (ICSP™)
- Run-Time Self-Programming (RTSP)

ICSP allows a dsPIC33FJ32GS406/606/608/610 and dsPIC33FJ64GS406/606/608/610 device to be serially programmed while in the end application circuit. This is done with two lines for programming clock and programming data (one of the alternate programming pin pairs: PGEC1/PGED1, PGEC2/PGED2 or PGEC3/

PGED3), and three other lines for power (VDD), ground (VSS) and Master Clear (MCLR). This allows customers to manufacture boards with unprogrammed devices and then program the Digital Signal Controller (DSC) just before shipping the product. This also allows the most recent firmware or a custom firmware to be programmed.

RTSP is accomplished using TBLRD (Table Read) and TBLWT (Table Write) instructions. With RTSP, the user application can write program memory data, either in blocks or ‘rows’ of 64 instructions (192 bytes) at a time, or a single program memory word, and erase program memory in blocks or ‘pages’ of 512 instructions (1536 bytes) at a time.

### 5.1 Table Instructions and Flash Programming

Regardless of the method used, all programming of Flash memory is done with the Table Read and Table Write instructions. These allow direct read and write access to the program memory space from the data memory while the device is in normal operating mode. The 24-bit target address in the program memory is formed using bits<7:0> of the TBLPAG register and the Effective Address (EA) from a W register specified in the table instruction, as shown in [Figure 5-1](#).

The TBLRDL and the TBLWTL instructions are used to read or write to bits<15:0> of program memory. TBLRDL and TBLWTL can access program memory in both Word and Byte modes.

The TBLRDH and TBLWTH instructions are used to read or write to bits<23:16> of program memory. TBLRDH and TBLWTH can also access program memory in Word or Byte mode.

**FIGURE 5-1: ADDRESSING FOR TABLE REGISTERS**

## 5.2 RTSP Operation

The dsPIC33FJ32GS406/606/608/610 and dsPIC33FJ64GS406/606/608/610 Flash program memory array is organized into rows of 64 instructions or 192 bytes. RTSP allows the user application to erase a page of memory, which consists of eight rows (512 instructions) at a time, and to program one row or one word at a time. Table 27-12 shows typical erase and programming times. The 8-row erase pages and single row write rows are edge-aligned from the beginning of program memory, on boundaries of 1536 bytes and 192 bytes, respectively.

The program memory implements holding buffers that can contain 64 instructions of programming data. Prior to the actual programming operation, the write data must be loaded into the buffers sequentially. The instruction words loaded must always be from a group of 64 boundary.

The basic sequence for RTSP programming is to set up a Table Pointer, then do a series of TBLWT instructions to load the buffers. Programming is performed by setting the control bits in the NVMCON register. A total of 64 TBLWTL and TBLWTH instructions are required to load the instructions.

All of the Table Write operations are single-word writes (two instruction cycles) because only the buffers are written. A programming cycle is required for programming each row.

## 5.3 Programming Operations

A complete programming sequence is necessary for programming or erasing the internal Flash in RTSP mode. The processor stalls (waits) until the programming operation is finished.

The programming time depends on the FRC accuracy (see Table 27-20) and the value of the FRC Oscillator Tuning register (see Register 9-4). Use the following formula to calculate the minimum and maximum values for the Row Write Time, Page Erase Time and Word Write Cycle Time parameters (see Table 27-12).

### EQUATION 5-1: PROGRAMMING TIME

$$T = \frac{11064 \text{ Cycles}}{7.37 \text{ MHz} \times (\text{FRC Accuracy})\% \times (\text{FRC Tuning})\%}$$

For example, if the device is operating at +125°C, the FRC accuracy will be ±2%. If the TUN<5:0> bits (see Register 9-4) are set to 'b000000, the minimum row write time is equal to Equation 5-2.

### EQUATION 5-2: MINIMUM ROW WRITE TIME

$$T_{RW} = \frac{11064 \text{ Cycles}}{7.37 \text{ MHz} \times (1 + 0.02) \times (1 - 0.00375)} = 1.477 \text{ ms}$$

The maximum row write time is equal to Equation 5-3.

### EQUATION 5-3: MAXIMUM ROW WRITE TIME

$$T_{RW} = \frac{11064 \text{ Cycles}}{7.37 \text{ MHz} \times (1 - 0.02) \times (1 - 0.00375)} = 1.537 \text{ ms}$$

Setting the WR bit (NVMCON<15>) starts the operation, and the WR bit is automatically cleared when the operation is finished.

## 5.4 Control Registers

Two SFRs are used to read and write the program Flash memory: NVMCON and NVMKEY.

The NVMCON register (Register 5-1) controls which blocks are to be erased, which memory type is to be programmed and the start of the programming cycle.

NVMKEY is a write-only register that is used for write protection. To start a programming or erase sequence, the user application must consecutively write 0x55 and 0xAA to the NVMKEY register. Refer to Section 5.3 “Programming Operations” for further details.

bit 7-0      **NVMKEY<7:0>:** Key Register bits (write-only)

## 5.4.1 PROGRAMMING ALGORITHM FOR FLASH PROGRAM MEMORY

One row of program Flash memory can be programmed at a time. To achieve this, it is necessary to erase the 8-row erase page that contains the desired row. The general process is:

1. Read eight rows of program memory (512 instructions) and store in data RAM.
2. Update the program data in RAM with the desired new data.
3. Erase the block (see [Example 5-1](#)):
  - a) Set the NVMOPx bits (NVMCON<3:0>) to '0010' to configure for block erase. Set the ERASE (NVMCON<6>) and WREN (NVMCON<14>) bits.
  - b) Write the starting address of the page to be erased into the TBLPAG and W registers.
  - c) Write 0x55 to NVMKEY.
  - d) Write 0xAA to NVMKEY.
  - e) Set the WR bit (NVMCON<15>). The erase cycle begins and the CPU stalls for the duration of the erase cycle. When the erase is done, the WR bit is cleared automatically.
4. Write the first 64 instructions from data RAM into the program memory buffers (see [Example 5-2](#)).
5. Write the program block to Flash memory:
  - a) Set the NVMOPx bits to '0001' to configure for row programming. Clear the ERASE bit and set the WREN bit.
  - b) Write 0x55 to NVMKEY.
  - c) Write 0xAA to NVMKEY.
  - d) Set the WR bit. The programming cycle begins and the CPU stalls for the duration of the write cycle. When the write to Flash memory is done, the WR bit is cleared automatically.
6. Repeat Steps 4 and 5, using the next available 64 instructions from the block in data RAM by incrementing the value in TBLPAG, until all 512 instructions are written back to Flash memory.

For protection against accidental operations, the write initiate sequence for NVMKEY must be used to allow any erase or program operation to proceed. After the programming command has been executed, the user application must wait for the programming time until programming is complete. The two instructions following the start of the programming sequence should be NOPs, as shown in [Example 5-3](#).

### EXAMPLE 5-1: ERASING A PROGRAM MEMORY PAGE

```
; Set up NVMCON for block erase operation
MOV    #0x4042, W0
MOV    W0, NVMCON
; Init pointer to row to be ERASED
MOV    #tblpage(PROG_ADDR), W0
MOV    W0, TBLPAG
MOV    #tbloffset(PROG_ADDR), W0
TBLWTL W0, [W0]
DISI   #5

MOV    #0x55, W0
MOV    W0, NVMKEY
MOV    #0xAA, W1
MOV    W1, NVMKEY
BSET   NVMCON, #WR
NOP
NOP
```

**EXAMPLE 5-2: LOADING THE WRITE BUFFERS**

```
; Set up NVMCON for row programming operations
MOV    #0x4001, W0          ;
MOV    W0, NVMCON           ; Initialize NVMCON
; Set up a pointer to the first program memory location to be written
; program memory selected, and writes enabled
MOV    #0x0000, W0          ;
MOV    W0, TBLPAG           ; Initialize PM Page Boundary SFR
MOV    #0x6000, W0          ; An example program memory address
; Perform the TBLWT instructions to write the latches
; 0th_program_word
MOV    #LOW_WORD_0, W2      ;
MOV    #HIGH_BYTE_0, W3    ;
TBLWTL W2, [W0]             ; Write PM low word into program latch
TBLWTH W3, [W0++]          ; Write PM high byte into program latch
; 1st_program_word
MOV    #LOW_WORD_1, W2      ;
MOV    #HIGH_BYTE_1, W3    ;
TBLWTL W2, [W0]             ; Write PM low word into program latch
TBLWTH W3, [W0++]          ; Write PM high byte into program latch
; 2nd_program_word
MOV    #LOW_WORD_2, W2      ;
MOV    #HIGH_BYTE_2, W3    ;
TBLWTL W2, [W0]             ; Write PM low word into program latch
TBLWTH W3, [W0++]          ; Write PM high byte into program latch
.
.
.
; 63rd_program_word
MOV    #LOW_WORD_31, W2     ;
MOV    #HIGH_BYTE_31, W3   ;
TBLWTL W2, [W0]             ; Write PM low word into program latch
TBLWTH W3, [W0++]          ; Write PM high byte into program latch
```

**EXAMPLE 5-3: INITIATING A PROGRAMMING SEQUENCE**

```
DISI    #5                  ; Block all interrupts with priority <7
                          ; for next 5 instructions
MOV     #0x55, W0
MOV     W0, NVMKEY          ; Write the 55 key
MOV     #0xAA, W1
MOV     W1, NVMKEY          ; Write the AA key
BSET    NVMCON, #WR         ; Start the erase sequence
NOP
NOP                          ; Insert two NOPs after the
NOP                          ; erase command is asserted
```

## 6.0 RESETS

**Note 1:** This data sheet summarizes the features of the dsPIC33FJ32GS406/606/608/610 and dsPIC33FJ64GS406/606/608/610 families of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 8. “Reset”** (DS70192) in the “dsPIC33F/PIC24H Family Reference Manual”, which is available from the Microchip web site ([www.microchip.com](http://www.microchip.com)).

**2:** Some registers and associated bits described in this section may not be available on all devices. Refer to **Section 4.0 “Memory Organization”** in this data sheet for device-specific register and bit information.

The Reset module combines all Reset sources and controls the device Master Reset Signal, SYSRST. The following is a list of device Reset sources:

- POR: Power-on Reset
- BOR: Brown-out Reset
- MCLR: Master Clear Pin Reset
- SWR: Software RESET Instruction
- WDTO: Watchdog Timer Reset
- TRAPR: Trap Conflict Reset
- IOPUWR: Illegal Condition Device Reset
  - Illegal Opcode Reset
  - Uninitialized W Register Reset
  - Security Reset

A simplified block diagram of the Reset module is shown in [Figure 6-1](#).

Any active source of Reset will make the SYSRST signal active. On system Reset, some of the registers associated with the CPU and peripherals are forced to a known Reset state and some are unaffected.

**Note:** Refer to the specific peripheral section or [Section 3.0 “CPU”](#) of this data sheet for register Reset states.

All types of device Reset sets a corresponding status bit in the RCON register to indicate the type of Reset (see [Register 6-1](#)).

A POR clears all the bits, except for the POR bit (RCON<0>), that are set. The user application can set or clear any bit at any time during code execution. The RCON bits only serve as status bits. Setting a particular Reset status bit in software does not cause a device Reset to occur.

The RCON register also has other bits associated with the Watchdog Timer and device power-saving states. The function of these bits is discussed in other sections of this manual.

**Note:** The status bits in the RCON register should be cleared after they are read so that the next RCON register value after a device Reset is meaningful.

**FIGURE 6-1: RESET SYSTEM BLOCK DIAGRAM**

| bit 7 |       |                       |       |       |       |       | bit 0 |

### Legend:

R = Readable bit  
-n = Value at POR

W = Writable bit  
'1' = Bit is set

U = Unimplemented bit, read as '0'  
'0' = Bit is cleared  
x = Bit is unknown

- bit 15      **TRAPR:** Trap Reset Flag bit  
1 = A Trap Conflict Reset has occurred  
0 = A Trap Conflict Reset has not occurred
- bit 14      **IOPUWR:** Illegal Opcode or Uninitialized W Access Reset Flag bit  
1 = An illegal opcode detection, an illegal address mode or uninitialized W register used as an Address Pointer caused a Reset  
0 = An illegal opcode or uninitialized W Reset has not occurred
- bit 13-9    **Unimplemented:** Read as '0'
- bit 8      **VREGS:** Voltage Regulator Standby During Sleep bit  
1 = Voltage regulator is active during Sleep  
0 = Voltage regulator goes into Standby mode during Sleep
- bit 7      **EXTR:** External Reset Pin ( $\overline{\text{MCLR}}$ ) bit  
1 = A Master Clear (pin) Reset has occurred  
0 = A Master Clear (pin) Reset has not occurred
- bit 6      **SWR:** Software Reset Flag (Instruction) bit  
1 = A **RESET** instruction has been executed  
0 = A **RESET** instruction has not been executed
- bit 5      **SWDTEN:** Software Enable/Disable of WDT bit<sup>(2)</sup>  
1 = WDT is enabled  
0 = WDT is disabled
- bit 4      **WDTO:** Watchdog Timer Time-out Flag bit  
1 = WDT time-out has occurred  
0 = WDT time-out has not occurred
- bit 3      **SLEEP:** Wake-up from Sleep Flag bit  
1 = Device has been in Sleep mode  
0 = Device has not been in Sleep mode
- bit 2      **IDLE:** Wake-up from Idle Flag bit  
1 = Device has been in Idle mode  
0 = Device has not been in Idle mode
- bit 1      **BOR:** Brown-out Reset Flag bit  
1 = A Brown-out Reset has occurred  
0 = A Brown-out Reset has not occurred
- bit 0      **POR:** Power-on Reset Flag bit  
1 = A Power-on Reset has occurred  
0 = A Power-on Reset has not occurred

**Note 1:** All of the Reset status bits can be set or cleared in software. Setting one of these bits in software does not cause a device Reset.

**2:** If the FWDTEN Configuration bit is '1' (unprogrammed), the WDT is always enabled, regardless of the SWDTEN bit setting.

## 6.1 System Reset

The dsPIC33FJ32GS406/606/608/610 and dsPIC33FJ64GS406/606/608/610 families of devices have two types of Reset:

- Cold Reset
- Warm Reset

A Cold Reset is the result of a Power-on Reset (POR) or a Brown-out Reset (BOR). On a Cold Reset, the FNOSC<sub>x</sub> Configuration bits in the FOSC Configuration register select the device clock source.

A Warm Reset is the result of all the other Reset sources, including the RESET instruction. On Warm Reset, the device will continue to operate from the current clock source as indicated by the Current Oscillator Selection (COSC<2:0>) bits in the Oscillator Control (OSCCON<14:12>) register.

The device is kept in a Reset state until the system power supplies have stabilized at appropriate levels and the oscillator clock is ready. The sequence in which this occurs is described in [Figure 6-2](#).

**TABLE 6-1: OSCILLATOR DELAY**

| Oscillator Mode        | Oscillator Start-up Delay        | Oscillator Start-up Timer       | PLL Lock Time                    | Total Delay                                                                 |

**Note 1:** T<sub>OSCD</sub> = Oscillator start-up delay (1.1 μs max. for FRC, 70 μs max. for LPRC). Crystal oscillator start-up times vary with crystal characteristics, load capacitance, etc.

**2:** T<sub>OST</sub> = Oscillator Start-up Timer (OST) delay (1024 oscillator clock period). For example, T<sub>OST</sub> = 102.4 μs for a 10 MHz crystal and T<sub>OST</sub> = 32 ms for a 32 kHz crystal.

**3:** T<sub>LOCK</sub> = PLL lock time (1.5 ms nominal) if PLL is enabled.

FIGURE 6-2: SYSTEM RESET TIMING

**Note:** When the device exits the Reset condition (begins normal operation), the device operating parameters (voltage, frequency, temperature, etc.) must be within their operating ranges; otherwise, the device may not function correctly. The user application must ensure that the delay between the time power is first applied, and the time SYSRST becomes inactive, is long enough to get all operating parameters within specification.

## 6.2 Power-on Reset (POR)

A Power-on Reset (POR) circuit ensures the device is reset from power-on. The POR circuit is active until VDD crosses the VPOR threshold and the delay, TPOR, has elapsed. The delay, TPOR, ensures the internal device bias circuits become stable.

The device supply voltage characteristics must meet the specified starting voltage and rise rate requirements to generate the POR. Refer to [Section 27.0 “Electrical Characteristics”](#) for details.

The Power-on Reset (POR) status bit in the Reset Control (RCON<0>) register is set to indicate the Power-on Reset.

## 6.3 Brown-out Reset (BOR) and Power-up Timer (PWRT)

The on-chip regulator has a Brown-out Reset (BOR) circuit that resets the device when the VDD is too low ( $VDD < V_{BOR}$ ) for proper device operation. The BOR circuit keeps the device in Reset until VDD crosses the

VBOR threshold and the delay, TBOR, has elapsed. The delay, TBOR, ensures the voltage regulator output becomes stable.

The Brown-out Reset (BOR) status bit in the Reset Control (RCON<1>) register is set to indicate the Brown-out Reset.

The device will not run at full speed after a BOR as the VDD should rise to acceptable levels for full-speed operation. The PWRT provides power-up time delay (TPWRT) to ensure that the system power supplies have stabilized at the appropriate levels for full-speed operation before the SYSRST is released.

The Power-up Timer delay (TPWRT) is programmed by the Power-on Reset Timer Value Select (FPWRT<2:0>) bits in the FPOR Configuration (FPOR<2:0>) register, which provides eight settings (from 0 ms to 128 ms). Refer to [Section 24.0 “Special Features”](#) for further details.

[Figure 6-3](#) shows the typical brown-out scenarios. The Reset delay (TBOR + TPWRT) is initiated each time VDD rises above the VBOR trip point

**FIGURE 6-3: BROWN-OUT SITUATIONS**

## 6.4 External Reset (EXTR)

The External Reset is generated by driving the  $\overline{\text{MCLR}}$  pin low. The  $\overline{\text{MCLR}}$  pin is a Schmitt Trigger input with an additional glitch filter. Reset pulses that are longer than the minimum pulse width will generate a Reset. Refer to [Section 27.0 “Electrical Characteristics”](#) for minimum pulse width specifications. The External Reset ( $\overline{\text{MCLR}}$ ) pin (EXTR) bit in the Reset Control (RCON) register is set to indicate the  $\overline{\text{MCLR}}$  Reset.

### 6.4.1 EXTERNAL SUPERVISORY CIRCUIT

Many systems have external supervisory circuits that generate Reset signals to reset multiple devices in the system. This external Reset signal can be directly connected to the  $\overline{\text{MCLR}}$  pin to reset the device when the rest of system is reset.

### 6.4.2 INTERNAL SUPERVISORY CIRCUIT

When using the internal power supervisory circuit to reset the device, the External Reset pin ( $\overline{\text{MCLR}}$ ) should be tied directly or resistively to VDD. In this case, the  $\overline{\text{MCLR}}$  pin will not be used to generate a Reset. The External Reset pin ( $\overline{\text{MCLR}}$ ) does not have an internal pull-up and must not be left unconnected.

## 6.5 Software RESET Instruction (SWR)

Whenever the RESET instruction is executed, the device will assert  $\overline{\text{SYSRST}}$ , placing the device in a special Reset state. This Reset state will not re-initialize the clock. The clock source in effect prior to the RESET instruction will remain.  $\overline{\text{SYSRST}}$  is released at the next instruction cycle and the Reset vector fetch will commence.

The Software Reset (SWR) flag (instruction) in the Reset Control (RCON<6>) register is set to indicate the Software Reset.

## 6.6 Watchdog Timer Time-out Reset (WDTO)

Whenever a Watchdog Timer Time-out Reset occurs, the device will asynchronously assert  $\overline{\text{SYSRST}}$ . The clock source will remain unchanged. A WDT time-out during Sleep or Idle mode will wake-up the processor, but will not reset the processor.

The Watchdog Timer Time-out (WDTO) flag in the Reset Control (RCON<4>) register is set to indicate the Watchdog Timer Reset. Refer to [Section 24.4 “Watchdog Timer \(WDT\)”](#) for more information on the Watchdog Timer Reset.

## 6.7 Trap Conflict Reset

If a lower priority hard trap occurs while a higher priority trap is being processed, a hard Trap Conflict Reset occurs. The hard traps include exceptions of Priority Level 13 through Level 15, inclusive. The address error (Level 13) and oscillator error (Level 14) traps fall into this category.

The Trap Reset (TRAPR) flag in the Reset Control (RCON<15>) register is set to indicate the Trap Conflict Reset. Refer to [Section 7.0 “Interrupt Controller”](#) for more information on Trap Conflict Resets.

## 6.8 Illegal Condition Device Reset

An illegal condition device Reset occurs due to the following sources:

- Illegal Opcode Reset
- Uninitialized W Register Reset
- Security Reset

The Illegal Opcode or Uninitialized W Access Reset (IOPUWR) flag in the Reset Control (RCON<14>) register is set to indicate the illegal condition device Reset.

### 6.8.1 ILLEGAL OPCODE RESET

A device Reset is generated if the device attempts to execute an illegal opcode value that is fetched from program memory.

The Illegal Opcode Reset function can prevent the device from executing program memory sections that are used to store constant data. To take advantage of the Illegal Opcode Reset, use only the lower 16 bits of each program memory section to store the data values. The upper 8 bits should be programmed with 3Fh, which is an illegal opcode value.

### 6.8.2 UNINITIALIZED W REGISTER RESET

Any attempt to use the uninitialized W register as an Address Pointer will reset the device. The W register array (with the exception of W15) is cleared during all Resets and is considered uninitialized until written to.

### 6.8.3 SECURITY RESET

If a Program Flow Change (PFC) or Vector Flow Change (VFC) targets a restricted location in a protected segment (boot and secure segment), that operation will cause a Security Reset.

The PFC occurs when the Program Counter is reloaded as a result of a call, jump, computed jump, return, return from subroutine or other form of branch instruction.

The VFC occurs when the Program Counter is reloaded with an interrupt or trap vector.

Refer to [Section 24.8 “Code Protection and CodeGuard™ Security”](#) for more information on Security Reset.

## 6.9 Using the RCON Status Bits

The user application can read the Reset Control (RCON) register after any device Reset to determine the cause of the Reset.

Table 6-2 provides a summary of the Reset flag bit operation.

**Note:** The status bits in the RCON register should be cleared after they are read so that the next RCON register value after a device Reset will be meaningful.

**TABLE 6-2: RESET FLAG BIT OPERATION**

| Flag Bit                | Set by:                                                             | Cleared by:                                     |
|-------------------------|---------------------------------------------------------------------|-------------------------------------------------|
| <b>TRAPR</b> (RCON<15>) | Trap conflict event                                                 | POR, BOR                                        |
| <b>IOPWR</b> (RCON<14>) | Illegal opcode or uninitialized W register access or Security Reset | POR, BOR                                        |
| <b>EXTR</b> (RCON<7>)   | $\overline{\text{MCLR}}$ Reset                                      | POR                                             |
| <b>SWR</b> (RCON<6>)    | RESET instruction                                                   | POR, BOR                                        |
| <b>WDTO</b> (RCON<4>)   | WDT time-out                                                        | PWRSV instruction, CLRWDI instruction, POR, BOR |
| <b>SLEEP</b> (RCON<3>)  | PWRSV #SLEEP instruction                                            | POR, BOR                                        |
| <b>IDLE</b> (RCON<2>)   | PWRSV #IDLE instruction                                             | POR, BOR                                        |
| <b>BOR</b> (RCON<1>)    | POR, BOR                                                            | —                                               |
| <b>POR</b> (RCON<0>)    | POR                                                                 | —                                               |

**Note:** All Reset flag bits can be set or cleared by user software.

NOTES:

## 7.0 INTERRUPT CONTROLLER

**Note 1:** This data sheet summarizes the features of the dsPIC33FJ32GS406/606/608/610 and dsPIC33FJ64GS406/606/608/610 families of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 47. “Interrupts (Part V)”** (DS70597) in the “dsPIC33F/PIC24H Family Reference Manual”, which is available from the Microchip web site ([www.microchip.com](http://www.microchip.com)).

**2:** Some registers and associated bits described in this section may not be available on all devices. Refer to **Section 4.0 “Memory Organization”** in this data sheet for device-specific register and bit information.

The dsPIC33FJ32GS406/606/608/610 and dsPIC33FJ64GS406/606/608/610 interrupt controller reduces the numerous peripheral interrupt request signals to a single interrupt request signal to the dsPIC33FJ32GS406/606/608/610 and dsPIC33FJ64GS406/606/608/610 CPU. It has the following features:

- Up to Eight Processor Exceptions and Software Traps
- Seven User-Selectable Priority Levels
- Interrupt Vector Table (IVT) with up to 118 Vectors
- A Unique Vector for each Interrupt or Exception Source
- Fixed Priority within a Specified User Priority Level
- Alternate Interrupt Vector Table (AIVT) for Debug Support
- Fixed Interrupt Entry and Return Latencies

### 7.1 Interrupt Vector Table

The Interrupt Vector Table (IVT) is shown in [Figure 7-1](#). The IVT resides in program memory, starting at location 000004h. The IVT contains 126 vectors, consisting of eight nonmaskable trap vectors, plus up to 118 sources of interrupt. In general, each interrupt source has its own vector. Each interrupt vector contains a 24-bit-wide address. The value programmed into each interrupt vector location is the starting address of the associated Interrupt Service Routine (ISR).

Interrupt vectors are prioritized in terms of their natural priority. This priority is linked to their position in the vector table. Lower addresses generally have a higher natural priority. For example, the interrupt associated with Vector 0 will take priority over interrupts at any other vector address.

The dsPIC33FJ32GS406/606/608/610 and dsPIC33FJ64GS406/606/608/610 devices implement up to 71 unique interrupts and five non-maskable traps. These are summarized in [Table 7-1](#).

#### 7.1.1 ALTERNATE INTERRUPT VECTOR TABLE

The Alternate Interrupt Vector Table (AIVT) is located after the IVT, as shown in [Figure 7-1](#). Access to the AIVT is provided by the ALTIVT control bit (INTCON2<15>). If the ALTIVT bit is set, all interrupt and exception processes use the alternate vectors instead of the default vectors. The alternate vectors are organized in the same manner as the default vectors.

The AIVT supports debugging by providing a means to switch between an application and a support environment without requiring the interrupt vectors to be reprogrammed. This feature also enables switching between applications for evaluation of different software algorithms at run time. If the AIVT is not needed, the AIVT should be programmed with the same addresses used in the IVT.

### 7.2 Reset Sequence

A device Reset is not a true exception because the interrupt controller is not involved in the Reset process. The dsPIC33FJ32GS406/606/608/610 and dsPIC33FJ64GS406/606/608/610 device clears its registers in response to a Reset, which forces the PC to zero. The Digital Signal Controller (DSC) then begins program execution at location, 0x000000. A GOTO instruction at the Reset address can redirect program execution to the appropriate start-up routine.

**Note:** Any unimplemented or unused vector locations in the IVT and AIVT should be programmed with the address of a default interrupt handler routine that contains a RESET instruction.

**FIGURE 7-1: dsPIC33FJ32GS406/606/608/610 and dsPIC33FJ64GS406/606/608/610 INTERRUPT VECTOR TABLE**

|                                        |                             |          |                                                        |

### 7.3 Interrupt Control and Status Registers

The dsPIC33FJ32GS406/606/608/610 and dsPIC33FJ64GS406/606/608/610 devices implement 44 registers for the interrupt controller:

- INTCON1
- INTCON2
- IFSx
- IECx
- IPCx
- INTTREG

#### 7.3.1 INTCON1 AND INTCON2

Global interrupt control functions are controlled from INTCON1 and INTCON2. INTCON1 contains the Interrupt Nesting Disable (NSTDIS) bit as well as the control and status flags for the processor trap sources. The INTCON2 register controls the external interrupt request signal behavior and the use of the Alternate Interrupt Vector Table.

#### 7.3.2 IFSx

The IFSx registers maintain all of the interrupt request flags. Each source of interrupt has a status bit, which is set by the respective peripherals or external signal and is cleared via software.

#### 7.3.3 IECx

The IECx registers maintain all of the interrupt enable bits. These control bits are used to individually enable interrupts from the peripherals or external signals.

#### 7.3.4 IPCx

The IPCx registers are used to set the Interrupt Priority Level for each source of interrupt. Each user interrupt source can be assigned to one of eight priority levels.

#### 7.3.5 INTTREG

The INTTREG register contains the associated interrupt vector number and the new CPU Interrupt Priority Level, which are latched into the Vector Number (VECNUM<6:0>) and Interrupt Level (ILR<3:0>) bit fields in the INTTREG register. The new Interrupt Priority Level is the priority of the pending interrupt.

The interrupt sources are assigned to the IFSx, IECx and IPCx registers in the same sequence that they are listed in [Table 7-1](#). For example, the INT0 (External Interrupt 0) is shown as having vector number 8 and a natural order priority of 0. Thus, the INT0IF bit is found in IFS0<0>, the INT0IE bit is found in IEC0<0> and the INT0IP bits are found in the first position of IPC0 (IPC0<2:0>).

#### 7.3.6 STATUS/CONTROL REGISTERS

Although they are not specifically part of the interrupt control hardware, two of the CPU Control registers contain bits that control interrupt functionality.

- The CPU STATUS Register, SR, contains the IPL<2:0> bits (SR<7:5>). These bits indicate the current CPU Interrupt Priority Level. The user can change the current CPU Priority Level by writing to the IPL bits.
- The CORCON register contains the IPL3 bit, which together with IPL<2:0>, indicates the current CPU Priority Level. IPL3 is a read-only bit so that trap events cannot be masked by the user software.

All Interrupt registers are described in [Register 7-1](#) through [Register 7-46](#) in the following pages.

# dsPIC33FJ32GS406/606/608/610 and dsPIC33FJ64GS406/606/608/610

bit 7-5 **IPL<2:0>**: CPU Interrupt Priority Level Status bits<sup>(2,3)</sup>

111 = CPU Interrupt Priority Level is 7 (15), user interrupts are disabled  
 110 = CPU Interrupt Priority Level is 6 (14)  
 101 = CPU Interrupt Priority Level is 5 (13)  
 100 = CPU Interrupt Priority Level is 4 (12)  
 011 = CPU Interrupt Priority Level is 3 (11)  
 010 = CPU Interrupt Priority Level is 2 (10)  
 001 = CPU Interrupt Priority Level is 1 (9)  
 000 = CPU Interrupt Priority Level is 0 (8)

**Note 1:** For complete register details, see [Register 3-1](#).

**2:** The IPL<2:0> bits are concatenated with the IPL<3> bit (CORCON<3>) to form the CPU Interrupt Priority Level. The value in parentheses indicates the IPL if IPL<3> = 1. User interrupts are disabled when IPL<3> = 1.

**3:** The IPL<2:0> Status bits are read-only when NSTDIS (INTCON1<15>) = 1.

## 7.4 Interrupt Setup Procedures

### 7.4.1 INITIALIZATION

Complete the following steps to configure an interrupt source at initialization:

1. Set the NSTDIS bit (INTCON1<15>) if nested interrupts are not desired.
2. Select the user-assigned priority level for the interrupt source by writing the control bits in the appropriate IPCx register. The priority level will depend on the specific application and type of interrupt source. If multiple priority levels are not desired, the IPCx register control bits for all enabled interrupt sources can be programmed to the same non-zero value.

**Note:** At a device Reset, the IPCx registers are initialized such that all user interrupt sources are assigned to Priority Level 4.

3. Clear the interrupt flag status bit associated with the peripheral in the associated IFSx register.
4. Enable the interrupt source by setting the interrupt enable control bit associated with the source in the appropriate IECx register.

### 7.4.2 INTERRUPT SERVICE ROUTINE

The method used to declare an ISR and initialize the IVT with the correct vector address depends on the programming language (C or assembler) and the language development toolsuite used to develop the application.

In general, the user application must clear the interrupt flag in the appropriate IFSx register for the source of interrupt that the ISR handles. Otherwise, program will re-enter the ISR immediately after exiting the routine. If the ISR is coded in assembly language, it must be terminated using a `RETFIE` instruction to unstack the saved PC value, SRL value and old CPU priority level.

### 7.4.3 TRAP SERVICE ROUTINE

A Trap Service Routine (TSR) is coded like an ISR, except that the appropriate trap status flag in the INTCON1 register must be cleared to avoid re-entry into the TSR.

### 7.4.4 INTERRUPT DISABLE

The following steps outline the procedure to disable all user interrupts:

1. Push the current SR value onto the software stack using the `PUSH` instruction.
2. Force the CPU to Priority Level 7 by inclusive ORing the value E0h with SRL.

To enable user interrupts, the `POP` instruction can be used to restore the previous SR value.

**Note:** Only user interrupts with a priority level of 7 or lower can be disabled. Trap sources (Level 8-Level 15) cannot be disabled.

The `DISI` instruction provides a convenient way to disable interrupts of Priority Levels 1-6 for a fixed period of time. Level 7 interrupt sources are not disabled by the `DISI` instruction.

## 8.0 DIRECT MEMORY ACCESS (DMA)

**Note 1:** This data sheet summarizes the features of the dsPIC33FJ32GS406/606/608/610 and dsPIC33FJ64GS406/606/608/610 family of devices. However, it is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 22. “Direct Memory Access (DMA)”** (DS70182) in the “dsPIC33F/PIC24H Family Reference Manual”, which is available from the Microchip web site ([www.microchip.com](http://www.microchip.com)).

**2:** Some registers and associated bits described in this section may not be available on all devices. Refer to **Section 4.0 “Memory Organization”** in this data sheet for device-specific register and bit information.

Direct Memory Access (DMA) is a very efficient mechanism of copying data between peripheral SFRs (e.g., the UART Receive register and Input Capture 1 buffer) and buffers or variables stored in RAM, with minimal CPU intervention. The DMA Controller (DMAC) can automatically copy entire blocks of data without requiring the user software to read or write the peripheral Special Function Registers (SFRs) every time a peripheral interrupt occurs. The DMA Controller uses a dedicated bus for data transfers and, therefore, does not steal cycles from the code execution flow of the CPU. To exploit the DMA capability, the corresponding user buffers or variables must be located in DMA RAM.

**Note:** The DMA module is not available on dsPIC33FJ32GS406/606/608/610 and dsPIC33FJ64GS406 devices.

The peripherals that can utilize DMA are listed in [Table 8-1](#) along with their associated Interrupt Request (IRQ) numbers.

**TABLE 8-1: DMA CONTROLLER CHANNEL TO PERIPHERAL ASSOCIATIONS**

| Peripheral to DMA Association         | DMAxREQ Register<br>IRQSEL<6:0> Bits | DMAxPAD Register<br>Values to Read from<br>Peripheral | DMAxPAD Register<br>Values to Write to<br>Peripheral |

The DMA Controller features four identical data transfer channels. Each channel has its own set of control and status registers. Each DMA Channel can be configured to copy data either from buffers stored in dual port DMA RAM to peripheral SFRs or from peripheral SFRs to buffers in DMA RAM.

The DMA Controller supports the following features:

- Word or byte-sized data transfers.
- Transfers from peripheral to DMA RAM or DMA RAM to peripheral
- Indirect Addressing of DMA RAM locations with or without automatic post-increment
- Peripheral Indirect Addressing – In some peripherals, the DMA RAM read/write addresses may be partially derived from the peripheral
- One-Shot Block Transfers – Terminating DMA transfer after one block transfer
- Continuous Block Transfers – Reloading DMA RAM buffer start address after every block transfer is complete
- Ping-Pong Mode – Switching between two DMA RAM start addresses between successive block transfers, thereby filling two buffers alternately
- Automatic or manual initiation of block transfers

For each DMA Channel, a DMA interrupt request is generated when a block transfer is complete. Alternatively, an interrupt can be generated when half of the block has been filled.

## 8.1 DMAC Registers

Each DMAC Channel  $x$  ( $x = 0, 1, 2$  or  $3$ ) contains the following registers:

- A 16-Bit DMA Channel Control Register (DMAxCON)
- A 16-Bit DMA Channel IRQ Select Register (DMAxREQ)
- A 16-Bit DMA RAM Primary Start Address Offset Register (DMAxSTA)
- A 16-Bit DMA RAM Secondary Start Address Offset Register (DMAxSTB)
- A 16-Bit DMA Peripheral Address Register (DMAxPAD)
- A 10-Bit DMA Transfer Count Register (DMAxCNT)

An additional pair of status registers, DMACS0 and DMACS1, are common to all DMAC channels.

'1' = Bit is set

'0' = Bit is cleared

x = Bit is unknown

- bit 15      **CHEN:** DMA Channel Enable bit  
             1 = Channel is enabled  
             0 = Channel is disabled
- bit 14      **SIZE:** Data Transfer Size bit  
             1 = Byte  
             0 = Word
- bit 13      **DIR:** Transfer Direction bit (source/destination bus select)  
             1 = Reads from DMA RAM address; writes to peripheral address  
             0 = Reads from peripheral address; writes to DMA RAM address
- bit 12      **HALF:** Early Block Transfer Complete Interrupt Select bit  
             1 = Initiates block transfer complete interrupt when half of the data has been moved  
             0 = Initiates block transfer complete interrupt when all of the data has been moved
- bit 11      **NULLW:** Null Data Peripheral Write Mode Select bit  
             1 = Null data write to peripheral in addition to DMA RAM write (DIR bit must also be clear)  
             0 = Normal operation
- bit 10-6    **Unimplemented:** Read as '0'
- bit 5-4      **AMODE<1:0>:** DMA Channel Operating Mode Select bits  
             11 = Reserved  
             10 = Peripheral Indirect Addressing mode  
             01 = Register Indirect without Post-Increment mode  
             00 = Register Indirect with Post-Increment mode
- bit 3-2      **Unimplemented:** Read as '0'
- bit 1-0      **MODE<1:0>:** DMA Channel Operating Mode Select bits  
             11 = One-Shot, Ping-Pong modes are enabled (one block transfer from/to each DMA RAM buffer)  
             10 = Continuous, Ping-Pong modes are enabled  
             01 = One-Shot, Ping-Pong modes are disabled  
             00 = Continuous, Ping-Pong modes are disabled

## dsPIC33FJ32GS406/606/608/610 and dsPIC33FJ64GS406/606/608/610

NOTES:

## 9.0 OSCILLATOR CONFIGURATION

**Note 1:** This data sheet summarizes the features of the dsPIC33FJ32GS406/606/608/610 and dsPIC33FJ64GS406/606/608/610 families of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 42. “Oscillator (Part IV)”** (DS70307) in the “*dsPIC33F/PIC24H Family Reference Manual*”, which is available from the Microchip web site ([www.microchip.com](http://www.microchip.com)).

**2:** Some registers and associated bits described in this section may not be available on all devices. Refer to **Section 4.0 “Memory Organization”** in this data sheet for device-specific register and bit information.

The oscillator system provides:

- External and Internal Oscillator Options as Clock Sources
- An On-Chip Phase-Locked Loop (PLL) to Scale the Internal Operating frequency to the Required System Clock Frequency
- An Internal FRC Oscillator that can also be used with the PLL, thereby allowing Full-Speed Operation without any External Clock Generation Hardware
- Clock Switching Between Various Clock Sources
- Programmable Clock Postscaler for System Power Savings
- A Fail-Safe Clock Monitor (FSCM) that Detects Clock Failure and takes Fail-Safe Measures
- A Clock Control Register (OSCCON)
- Nonvolatile Configuration bits for Main Oscillator Selection
- Auxiliary PLL for ADC and PWM

A simplified diagram of the oscillator system is shown in [Figure 9-1](#).

FIGURE 9-1: OSCILLATOR SYSTEM DIAGRAM

## 9.1 CPU Clocking System

The dsPIC33FJ32GS406/606/608/610 and dsPIC33FJ64GS406/606/608/610 devices provide six system clock options:

- Fast RC (FRC) Oscillator
- FRC Oscillator with PLL
- Primary (XT, HS, or EC) Oscillator
- Primary Oscillator with PLL
- Low-Power RC (LPRC) Oscillator
- FRC Oscillator with Postscaler
- Secondary (LP) Oscillator

### 9.1.1 SYSTEM CLOCK SOURCES

The Fast RC (FRC) internal oscillator runs at a nominal frequency of 7.37 MHz. User software can tune the FRC frequency. User software can optionally specify a factor (ranging from 1:2 to 1:256) by which the FRC clock frequency is divided. This factor is selected using the FRCDIV<2:0> (CLKDIV<10:8>) bits.

The primary oscillator can use one of the following as its clock source:

- XT (Crystal): Crystals and ceramic resonators in the range of 3 MHz to 10 MHz. The crystal is connected to the OSC1 and OSC2 pins
- HS (High-Speed Crystal): Crystals in the range of 10 MHz to 50 MHz. The crystal is connected to the OSC1 and OSC2 pins
- EC (External Clock): The external clock signal is directly applied to the OSC1 pin

The secondary (LP) oscillator is designed for low power and uses a 32.768 kHz crystal or ceramic resonator. The LP oscillator uses the SOSCI and SOSCO pins.

The LPRC internal oscillator runs at a nominal frequency of 32.768 kHz. It is also used as a reference clock by the Watchdog Timer (WDT) and Fail-Safe Clock Monitor (FSCM).

The clock signals generated by the FRC and primary oscillators can be optionally applied to an on-chip Phase-Locked Loop (PLL) to provide a wide range of output frequencies for device operation. PLL configuration is described in [Section 9.1.3 “PLL Configuration”](#).

The FRC frequency depends on the FRC accuracy (see [Table 27-20](#)) and the value of the FRC Oscillator Tuning register (see [Register 9-4](#)).

### 9.1.2 SYSTEM CLOCK SELECTION

The oscillator source used at a device Power-on Reset event is selected using Configuration bit settings. The Oscillator Configuration bit settings are located in the Configuration registers in the program memory. (Refer to [Section 24.1 “Configuration Bits”](#) for further details.) The Initial Oscillator Selection Configuration bits, FNOSC<2:0> (FOSCSEL<2:0>), and the Primary Oscillator Mode Select Configuration bits, POSCMD<1:0> (FOSC<1:0>), select the oscillator source that is used at a Power-on Reset. The FRC primary oscillator is the default (unprogrammed) selection.

The Configuration bits allow users to choose among 12 different clock modes, shown in [Table 9-1](#).

The output of the oscillator (or the output of the PLL if a PLL mode has been selected), Fosc, is divided by 2 to generate the device instruction clock (Fcy) and the peripheral clock time base (Fp). Fcy defines the operating speed of the device and speeds up to 50 MIPS are supported by the device architecture.

Instruction execution speed or device operating frequency, Fcy, is given by [Equation 9-1](#).

#### EQUATION 9-1: DEVICE OPERATING FREQUENCY

$$F_{CY} = F_{OSC}/2$$

**TABLE 9-1: CONFIGURATION BIT VALUES FOR CLOCK SELECTION**

| Oscillator Mode                                 | Oscillator Source | POSCMD<1:0> | FNOSC<2:0> | See Notes            |

**Note 1:** OSC2 pin function is determined by the OSCIOFNC Configuration bit.

**2:** This is the default oscillator mode for an unprogrammed (erased) device.

### 9.1.3 PLL CONFIGURATION

The primary oscillator and internal FRC oscillator can optionally use an on-chip PLL to obtain higher speeds of operation. The PLL provides significant flexibility in selecting the device operating speed. A block diagram of the PLL is shown in [Figure 9-2](#).

The output of the primary oscillator or FRC, denoted as 'FIN', is divided down by a prescale factor (N1) of 2, 3, ... or 33 before being provided to the PLL's Voltage Controlled Oscillator (VCO). The input to the VCO must be selected in the range of 0.8 MHz to 8 MHz. The prescale factor 'N1' is selected using the PLLPRE<4:0> bits (CLKDIV<4:0>).

The PLL Feedback Divisor, selected using the PLLDIV<8:0> bits (PLLFBD<8:0>), provides a factor, 'M', by which the input to the VCO is multiplied. This factor must be selected such that the resulting VCO output frequency is in the range of 100 MHz to 200 MHz.

The VCO output is further divided by a postscale factor, 'N2'. This factor is selected using the PLLPOST<1:0> bits (CLKDIV<7:6>). 'N2' can be either 2, 4 or 8, and must be selected such that the PLL output frequency (Fosc) is in the range of 12.5 MHz to 100 MHz, which generates device operating speeds of 6.25-50 MIPS.

For a primary oscillator or FRC oscillator, output 'FIN', the PLL output 'Fosc' is given by [Equation 9-2](#).

#### EQUATION 9-2: Fosc CALCULATION

$$F_{OSC} = F_{IN} * \left( \frac{M}{N1 * N2} \right)$$

For example, suppose a 10 MHz crystal is being used with the selected oscillator mode of XT with PLL (see [Equation 9-3](#)).

- If PLLPRE<4:0> = 0000, then N1 = 2. This yields a VCO input of 10/2 = 5 MHz, which is within the acceptable range of 0.8-8 MHz.
- If PLLDIV<8:0> = 0x26, then M = 40. This yields a VCO output of 5 x 40 = 200 MHz, which is within the 100-200 MHz ranged needed.
- If PLLPOST<1:0> = 00, then N2 = 2. This provides a Fosc of 200/2 = 100 MHz. The resultant device operating speed is 100/2 = 40 MIPS.

#### EQUATION 9-3: XT WITH PLL MODE EXAMPLE

$$F_{CY} = \frac{F_{OSC}}{2} = \frac{1}{2} \left( \frac{10000000 * 40}{2 * 2} \right) = 50 \text{ MIPS}$$

**FIGURE 9-2: PLL BLOCK DIAGRAM**

## 9.2 Auxiliary Clock Generation

The auxiliary clock generation is used for a peripherals that need to operate at a frequency unrelated to the system clock such as a PWM or ADC.

The primary oscillator and internal FRC oscillator sources can be used with an auxiliary PLL to obtain the auxiliary clock. The auxiliary PLL has a fixed 16x multiplication factor.

The auxiliary clock has the following configuration restrictions:

- For proper PWM operation, auxiliary clock generation must be configured for 120 MHz (see Parameter [OS56](#) in [Table 27-18](#) in [Section 27.0 “Electrical Characteristics”](#)). If a slower frequency is desired, the PWM Input Clock Prescaler (Divider) Select bits (PCLKDIV<2:0>) should be used.
- To achieve 1.04 ns PWM resolution, the auxiliary clock must use the 16x auxiliary PLL (APLL). All other clock sources will have a minimum PWM resolution of 8 ns.
- If the primary PLL is used as a source for the auxiliary clock, the primary PLL should be configured up to a maximum operation of 30 MIPS or less.

## 9.3 Reference Clock Generation

The reference clock output logic provides the user with the ability to output a clock signal based on the system clock or the crystal oscillator on a device pin. The user application can specify a wide range of clock scaling prior to outputting the reference clock.

| <b>Legend:</b>    | C = Clearable bit | y = Value set from Configuration bits on POR |
| R = Readable bit  | W = Writable bit  | U = Unimplemented bit, read as '0'           |
| -n = Value at POR | '1' = Bit is set  | '0' = Bit is cleared                         |
|                   |                   | x = Bit is unknown                           |

bit 15 **Unimplemented:** Read as '0'

bit 14-12 **COSC<2:0>:** Current Oscillator Selection bits (read-only)

- 111 = Fast RC oscillator (FRC) with divide-by-n
- 110 = Fast RC oscillator (FRC) with divide-by-16
- 101 = Low-Power RC oscillator (LPRC)
- 100 = Secondary oscillator (SOSC)
- 011 = Primary oscillator (XT, HS, EC) with PLL
- 010 = Primary oscillator (XT, HS, EC)
- 001 = Fast RC oscillator (FRC) with PLL
- 000 = Fast RC oscillator (FRC)

bit 11 **Unimplemented:** Read as '0'

bit 10-8 **NOSC<2:0>:** New Oscillator Selection bits<sup>(2)</sup>

- 111 = Fast RC oscillator (FRC) with divide-by-n
- 110 = Fast RC oscillator (FRC) with divide-by-16
- 101 = Low-Power RC oscillator (LPRC)
- 100 = Secondary oscillator (SOSC)
- 011 = Primary oscillator (XT, HS, EC) with PLL
- 010 = Primary oscillator (XT, HS, EC)
- 001 = Fast RC oscillator (FRC) with PLL
- 000 = Fast RC oscillator (FRC)

bit 7 **CLKLOCK:** Clock Lock Enable bit

If Clock Switching is Enabled and FSCM is Disabled (FCKSM<1:0> (FOSC<7:6>) = 0b01):

- 1 = Clock switching is disabled, system clock source is locked
- 0 = Clock switching is enabled, system clock source can be modified by clock switching

bit 6 **Unimplemented:** Read as '0'

bit 5 **LOCK:** PLL Lock Status bit (read-only)

- 1 = Indicates that PLL is in lock or PLL start-up timer is satisfied
- 0 = Indicates that PLL is out of lock, start-up timer is in progress or PLL is disabled

bit 4 **Unimplemented:** Read as '0'

**Note 1:** Writes to this register require an unlock sequence. Refer to **Section 42. "Oscillator (Part IV)"** (DS70307) in the *"dsPIC33F/PIC24H Family Reference Manual"* for details.

**2:** Direct clock switches between any primary oscillator mode with PLL and FRCPLL mode are not permitted. This applies to clock switches in either direction. In these instances, the application must switch to FRC mode as a transition clock source between the two PLL modes.

bit 7-0      **Unimplemented:** Read as '0'

**Note 1:** The reference oscillator output must be disabled (ROON = 0) before writing to these bits.

## 9.5 Clock Switching Operation

Applications are free to switch among any of the four clock sources (primary, LP, FRC and LPRC) under software control at any time. To limit the possible side effects of this flexibility, dsPIC33FJ32GS406/606/608/610 and dsPIC33FJ64GS406/606/608/610 devices have a safeguard lock built into the switch process.

**Note:** Primary oscillator mode has three different submodes (XT, HS and EC), which are determined by the POSCMD<1:0> Configuration bits. While an application can switch to and from primary oscillator mode in software, it cannot switch among the different primary submodes without reprogramming the device.

### 9.5.1 ENABLING CLOCK SWITCHING

To enable clock switching, the FCKSM1 Configuration bit in the Configuration register must be programmed to '0'. (Refer to [Section 24.1 "Configuration Bits"](#) for further details.) If the FCKSM1 Configuration bit is unprogrammed ('1'), the clock switching function and Fail-Safe Clock Monitor function are disabled. This is the default setting.

The NOSC control bits (OSCCON<10:8>) do not control the clock selection when clock switching is disabled. However, the COSC bits (OSCCON<14:12>) reflect the clock source selected by the FNOSC Configuration bits.

The OSWEN control bit (OSCCON<0>) has no effect when clock switching is disabled. It is held at '0' at all times.

### 9.5.2 OSCILLATOR SWITCHING SEQUENCE

To perform a clock switch, the following basic sequence is required:

1. If desired, read the COSCx bits (OSCCON<14:12>) to determine the current oscillator source.
2. Perform the unlock sequence to allow a write to the OSCCON register high byte.
3. Write the appropriate value to the NOSCx control bits (OSCCON<10:8>) for the new oscillator source.
4. Perform the unlock sequence to allow a write to the OSCCON register low byte.
5. Set the OSWEN bit (OSCCON<0>) to initiate the oscillator switch.

Once the basic sequence is completed, the system clock hardware responds automatically as follows:

1. The clock switching hardware compares the COSCx status bits with the new value of the NOSCx control bits. If they are the same, the clock switch is a redundant operation. In this case, the OSWEN bit is cleared automatically and the clock switch is aborted.

2. If a valid clock switch has been initiated, the LOCK (OSCCON<5>) and the CF (OSCCON<3>) status bits are cleared.
3. The new oscillator is turned on by the hardware if it is not currently running. If a crystal oscillator must be turned on, the hardware waits until the Oscillator Start-up Timer (OST) expires. If the new source is using the PLL, the hardware waits until a PLL lock is detected (LOCK = 1).
4. The hardware waits for 10 clock cycles from the new clock source and then performs the clock switch.
5. The hardware clears the OSWEN bit to indicate a successful clock transition. In addition, the NOSCx bit values are transferred to the COSCx status bits.
6. The old clock source is turned off at this time, with the exception of LPRC (if WDT or FSCM are enabled) or LP (if LPOSCEN remains set).

**Note 1:** The processor continues to execute code throughout the clock switching sequence. Timing-sensitive code should not be executed during this time.

- 2: Direct clock switches between any primary oscillator mode with PLL and FRCPLL mode are not permitted. This applies to clock switches in either direction. In these instances, the application must switch to FRC mode as a transition clock source between the two PLL modes.

- 3: Refer to [Section 42. "Oscillator \(Part IV\)"](#) (DS70307) in the *"dsPIC33F/PIC24H Family Reference Manual"* for details.

## 9.6 Fail-Safe Clock Monitor (FSCM)

The Fail-Safe Clock Monitor (FSCM) allows the device to continue to operate even in the event of an oscillator failure. The FSCM function is enabled by programming. If the FSCM function is enabled, the LPRC internal oscillator runs at all times (except during Sleep mode) and is not subject to control by the Watchdog Timer.

In the event of an oscillator failure, the FSCM generates a clock failure trap event and switches the system clock over to the FRC oscillator. Then, the application program can either attempt to restart the oscillator or execute a controlled shutdown. The trap can be treated as a Warm Reset by simply loading the Reset address into the oscillator fail trap vector.

If the PLL multiplier is used to scale the system clock, the internal FRC is also multiplied by the same factor on clock failure. Essentially, the device switches to FRC with PLL on a clock failure.

NOTES:

## 10.0 POWER-SAVING FEATURES

**Note 1:** This data sheet summarizes the features of the dsPIC33FJ32GS406/606/608/610 and dsPIC33FJ64GS406/606/608/610 families of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 9. “Watchdog Timer and Power-Saving Modes”** (DS70196) in the “dsPIC33F/PIC24H Family Reference Manual”, which is available from the Microchip web site ([www.microchip.com](http://www.microchip.com)).

**2:** Some registers and associated bits described in this section may not be available on all devices. Refer to **Section 4.0 “Memory Organization”** in this data sheet for device-specific register and bit information.

The dsPIC33FJ32GS406/606/608/610 and dsPIC33FJ64GS406/606/608/610 devices provide the ability to manage power consumption by selectively managing clocking to the CPU and the peripherals. In general, a lower clock frequency and a reduction in the number of circuits being clocked constitutes lower consumed power. Devices can manage power consumption in four different ways:

- Clock Frequency
- Instruction-Based Sleep and Idle modes
- Software Controlled Doze mode
- Selective Peripheral Control in Software

Combinations of these methods can be used to selectively tailor an application's power consumption while still maintaining critical application features, such as timing-sensitive communications.

### 10.1 Clock Frequency and Clock Switching

The devices allow a wide range of clock frequencies to be selected under application control. If the system clock configuration is not locked, users can choose low-power or high-precision oscillators by simply changing the NOSC<sub>x</sub> bits (OSCCON<10:8>). The process of changing a system clock during operation, as well as limitations to the process, are discussed in more detail in **Section 9.0 “Oscillator Configuration”**.

#### EXAMPLE 10-1: PWRSAV INSTRUCTION SYNTAX

```
PWRSAV #SLEEP_MODE    ; Put the device into SLEEP mode
PWRSAV #IDLE_MODE      ; Put the device into IDLE mode
```

## 10.2 Instruction-Based Power-Saving Modes

The devices have two special power-saving modes that are entered through the execution of a special PWRSAV instruction. Sleep mode stops clock operation and halts all code execution. Idle mode halts the CPU and code execution, but allows peripheral modules to continue operation. The assembler syntax of the PWRSAV instruction is shown in **Example 10-1**.

**Note:** SLEEP\_MODE and IDLE\_MODE are constants defined in the assembler include file for the selected device.

Sleep and Idle modes can be exited as a result of an enabled interrupt, WDT time-out or a device Reset. When the device exits these modes, it is said to wake-up.

### 10.2.1 SLEEP MODE

The following occurs in Sleep mode:

- The system clock source is shut down. If an on-chip oscillator is used, it is turned off.
- The device current consumption is reduced to a minimum, provided that no I/O pin is sourcing current.
- The Fail-Safe Clock Monitor does not operate, since the system clock source is disabled.
- The LPRC clock continues to run in Sleep mode if the WDT is enabled.
- The WDT, if enabled, is automatically cleared prior to entering Sleep mode.
- Some device features or peripherals may continue to operate. This includes the items such as the input change notification on the I/O ports or peripherals that use an external clock input.
- Any peripheral that requires the system clock source for its operation is disabled.

The device will wake-up from Sleep mode on any of these events:

- Any interrupt source that is individually enabled
- Any form of device Reset
- A WDT time-out

On wake-up from Sleep mode, the processor restarts with the same clock source that was active when Sleep mode was entered.

## 10.2.2 IDLE MODE

The following occur in Idle mode:

- The CPU stops executing instructions.
- The WDT is automatically cleared.
- The system clock source remains active. By default, all peripheral modules continue to operate normally from the system clock source, but can also be selectively disabled (see [Section 10.5 “Peripheral Module Disable”](#)).
- If the WDT or FSCM is enabled, the LPRC also remains active.

The device will wake-up from Idle mode on any of these events:

- Any interrupt that is individually enabled
- Any device Reset
- A WDT time-out

On wake-up from Idle mode, the clock is reapplied to the CPU and instruction execution will begin (2-4 clock cycles later), starting with the instruction following the `PWRSV` instruction, or the first instruction in the ISR.

## 10.2.3 INTERRUPTS COINCIDENT WITH POWER SAVE INSTRUCTIONS

Any interrupt that coincides with the execution of a `PWRSV` instruction is held off until entry into Sleep or Idle mode has completed. The device then wakes up from Sleep or Idle mode.

## 10.3 Doze Mode

The preferred strategies for reducing power consumption are changing clock speed and invoking one of the power-saving modes. In some circumstances, this may not be practical. For example, it may be necessary for an application to maintain uninterrupted synchronous communication, even while it is doing nothing else. Reducing system clock speed can introduce communication errors, while using a power-saving mode can stop communications completely.

Doze mode is a simple and effective alternative method to reduce power consumption while the device is still executing code. In this mode, the system clock continues to operate from the same source and at the same speed. Peripheral modules continue to be clocked at the same speed, while the CPU clock speed is reduced. Synchronization between the two clock domains is maintained, allowing the peripherals to access the SFRs while the CPU executes code at a slower rate.

Doze mode is enabled by setting the DOZEN bit (`CLKDIV<11>`). The ratio between peripheral and core clock speed is determined by the `DOZE<2:0>` bits (`CLKDIV<14:12>`). There are eight possible configurations, from 1:1 to 1:128, with 1:1 being the default setting.

Programs can use Doze mode to selectively reduce power consumption in event-driven applications. This allows clock-sensitive functions, such as synchronous communications, to continue without interruption while the CPU idles, waiting for something to invoke an interrupt routine. An automatic return to full-speed CPU operation on interrupts can be enabled by setting the ROI bit (`CLKDIV<15>`). By default, interrupt events have no effect on Doze mode operation.

For example, suppose the device is operating at 20 MIPS and the CAN module has been configured for 500 kbps based on this device operating speed. If the device is placed in Doze mode with a clock frequency ratio of 1:4, the CAN module continues to communicate at the required bit rate of 500 kbps, but the CPU now starts executing instructions at a frequency of 5 MIPS.

## 10.4 PWM Power-Saving Features

Typically, many applications need either a high-resolution duty cycle or phase offset (for fixed frequency operation) or a high-resolution PWM period for variable frequency modes of operation (such as Resonant mode). Very few applications require both high-resolution modes simultaneously.

The `HRPDIS` and the `HRDDIS` bits in the `AUXCONx` registers permit the user to disable the circuitry associated with the high-resolution duty cycle and PWM period to reduce the operating current of the device.

If the `HRDDIS` bit is set, the circuitry associated with the high-resolution duty cycle, phase offset, and dead time for the respective PWM generator is disabled. If the `HRPDIS` bit is set, the circuitry associated with the high-resolution PWM period for the respective PWM generator is disabled.

When the `HRPDIS` bit is set, the smallest unit of measure for the PWM period is 8.32 ns.

If the `HRDDIS` bit is set, the smallest unit of measure for the PWM duty cycle, phase offset and dead time is 8.32 ns.

## 10.5 Peripheral Module Disable

The Peripheral Module Disable (PMD) registers provide a method to disable a peripheral module by stopping all clock sources supplied to that module. When a peripheral is disabled using the appropriate PMD control bit, the peripheral is in a minimum power consumption state. The control and status registers associated with the peripheral are also disabled, so writes to those registers will have no effect and read values will be invalid.

A peripheral module is enabled only if both the associated bit in the PMD register is cleared and the peripheral is supported by the specific dsPIC® DSC variant. If the peripheral is present in the device, it is enabled in the PMD register by default.

|              |                                                                                                                                                                                                                                                                                                             |
|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Note:</b> | If a PMD bit is set, the corresponding module is disabled after a delay of one instruction cycle. Similarly, if a PMD bit is cleared, the corresponding module is enabled after a delay of one instruction cycle (assuming the module control registers are already configured to enable module operation). |

NOTES:

## 11.0 I/O PORTS

**Note 1:** This data sheet summarizes the features of the dsPIC33FJ32GS406/606/608/610 and dsPIC33FJ64GS406/606/608/610 families of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 10. "I/O Ports"** (DS70193) in the *"dsPIC33F/PIC24H Family Reference Manual"*, which is available from the Microchip web site ([www.microchip.com](http://www.microchip.com)).

**2:** Some registers and associated bits described in this section may not be available on all devices. Refer to **Section 4.0 "Memory Organization"** in this data sheet for device-specific register and bit information.

All of the device pins (except VDD, VSS,  $\overline{\text{MCLR}}$  and OSC1/CLKI) are shared among the peripherals and the parallel I/O ports. All I/O input ports feature Schmitt Trigger inputs for improved noise immunity.

### 11.1 Parallel I/O (PIO) Ports

Generally a parallel I/O port that shares a pin with a peripheral is subservient to the peripheral. The peripheral's output buffer data and control signals are provided to a pair of multiplexers. The multiplexers select whether the peripheral or the associated port has ownership of the output data and control signals of the I/O pin. The logic also prevents "loop through", in which a port's digital output can drive the input of a peripheral that shares the same pin. [Figure 11-1](#) shows how ports are shared with other peripherals and the associated I/O pin to which they are connected.

When a peripheral is enabled and the peripheral is actively driving an associated pin, the use of the pin as a general purpose output pin is disabled. The I/O pin can be read, but the output driver for the parallel port bit is disabled. If a peripheral is enabled, but the peripheral is not actively driving a pin, that pin can be driven by a port.

All port pins have three registers directly associated with their operation as digital I/O. The Data Direction register (TRISx) determines whether the pin is an input or an output. If the data direction bit is '1', then the pin is an input. All port pins are defined as inputs after a Reset. Reads from the latch (LATx) read the latch. Writes to the latch write the latch. Reads from the port (PORTx) read the port pins, while writes to the port pins write the latch.

Any bit and its associated data and control registers that are not valid for a particular device will be disabled. That means the corresponding LATx and TRISx registers and the port pin will read as zeros.

When a pin is shared with another peripheral or function that is defined as an input only, it is nevertheless regarded as a dedicated port because there is no other competing source of outputs.

FIGURE 11-1: BLOCK DIAGRAM OF A TYPICAL SHARED PORT STRUCTURE

## 11.2 Open-Drain Configuration

In addition to the PORT, LAT and TRIS registers for data control, some digital-only port pins can also be individually configured for either digital or open-drain output. This is controlled by the Open-Drain Control register, ODCx, associated with each port. Setting any of the bits configures the corresponding pin to act as an open-drain output.

The open-drain feature allows the generation of outputs higher than V<sub>DD</sub> (for example, 5V) on any desired 5V tolerant pins by using external pull-up resistors. The maximum open-drain voltage allowed is the same as the maximum V<sub>IH</sub> specification.

Refer to “[Pin Diagrams](#)” for the available pins and their functionality.

## 11.3 Configuring Analog Port Pins

The ADPCFG and TRIS registers control the operation of the analog-to-digital port pins. The port pins that are to function as analog inputs must have their corresponding TRIS bit set (input). If the TRIS bit is cleared (output), the digital output level (V<sub>OH</sub> or V<sub>OL</sub>) will be converted.

The ADPCFG and ADPCFG2 registers have a default value of 0x000; therefore, all pins that share ANx functions are analog (not digital) by default.

When the PORT register is read, all pins configured as analog input channels will read as cleared (a low level).

Pins configured as digital inputs will not convert an analog input. Analog levels on any pin defined as a digital input (including the ANx pins) can cause the input buffer to consume current that exceeds the device specifications.

## 11.4 I/O Port Write/Read Timing

One instruction cycle is required between a port direction change or port write operation and a read operation of the same port. Typically, this instruction would be a NOP. An example is shown in [Example 11-1](#).

## 11.5 Input Change Notification

The input change notification function of the I/O ports allows the dsPIC33FJ32GS406/606/608/610 and dsPIC33FJ64GS406/606/608/610 devices to generate interrupt requests to the processor in response to a Change-of-State (COS) on selected input pins. This feature can detect input Change-of-States even in Sleep mode, when the clocks are disabled. Depending on the device pin count, up to 30 external signals (CNx pin) can be selected (enabled) for generating an interrupt request on a Change-of-State.

Four control registers are associated with the CN module. The CNEN1 and CNEN2 registers contain the interrupt enable control bits for each of the CN input pins. Setting any of these bits enables a CN interrupt for the corresponding pins.

Each CN pin also has a weak pull-up connected to it. The pull-ups act as a current source connected to the pin, and eliminate the need for external resistors when the push button or keypad devices are connected. The pull-ups are enabled separately using the CNPU1 and CNPU2 registers, which contain the control bits for each of the CN pins. Setting any of the control bits enables the weak pull-ups for the corresponding pins.

**Note:** Pull-ups on change notification pins should always be disabled when the port pin is configured as a digital output.

### EQUATION 11-1: PORT WRITE/READ EXAMPLE

```
MOV    0xFF00, W0           ; Configure PORTB<15:8> as inputs
MOV    W0, TRISBB           ; and PORTB<7:0> as outputs
NOP                                ; Delay 1 cycle
BTSS   PORTB, #13           ; Next Instruction
```

NOTES:

## 12.0 TIMER1

**Note 1:** This data sheet summarizes the features of the dsPIC33FJ32GS406/606/608/610 and dsPIC33FJ64GS406/606/608/610 families of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 11. “Timers”** (DS70205) in the “dsPIC33F/PIC24H Family Reference Manual”, which is available from the Microchip web site ([www.microchip.com](http://www.microchip.com)).

**2:** Some registers and associated bits described in this section may not be available on all devices. Refer to **Section 4.0 “Memory Organization”** in this data sheet for device-specific register and bit information.

The Timer1 module is a 16-bit timer, which can serve as a time counter for the Real-Time Clock (RTC), or operate as a free-running interval timer/counter.

The Timer1 module has the following unique features over other timers:

- Can be operated from the low-power 32.767 kHz crystal oscillator available on the device
- Can be operated in Asynchronous Counter mode from an external clock source.
- The external clock input (T1CK) can optionally be synchronized to the internal device clock and the clock synchronization is performed after the prescaler.

The unique features of Timer1 allow it to be used for Real-Time Clock (RTC) applications. A block diagram of Timer1 is shown in **Figure 12-1**.

The Timer1 module can operate in one of the following modes:

- Timer mode
- Gated Timer mode
- Synchronous Counter mode
- Asynchronous Counter mode

In Timer and Gated Timer modes, the input clock is derived from the internal instruction cycle clock (Fcy). In Synchronous and Asynchronous Counter modes, the input clock is derived from the external clock input at the T1CK pin.

The Timer modes are determined by the following bits:

- Timer Clock Source Control bit: TCS (T1CON<1>)
- Timer Synchronization Control bit: TSYNC (T1CON<2>)
- Timer Gate Control bit: TGATE (T1CON<6>)

The timer control bit settings for different operating modes are given in the **Table 12-1**.

**TABLE 12-1: TIMER MODE SETTINGS**

| Mode                 | TCS | TGATE | TSYNC |
|----------------------|-----|-------|-------|
| Timer                | 0   | 0     | x     |
| Gated Timer          | 0   | 1     | x     |
| Synchronous Counter  | 1   | x     | 1     |
| Asynchronous Counter | 1   | x     | 0     |

## 13.0 TIMER2/3/4/5 FEATURES

**Note 1:** This data sheet summarizes the features of the dsPIC33FJ32GS406/606/608/610 and dsPIC33FJ64GS406/606/608/610 families of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 11. “Timers”** (DS70205) in the “dsPIC33F/PIC24H Family Reference Manual”, which is available from the Microchip web site ([www.microchip.com](http://www.microchip.com)).

**2:** Some registers and associated bits described in this section may not be available on all devices. Refer to **Section 4.0 “Memory Organization”** in this data sheet for device-specific register and bit information.

Timer2 and Timer4 are Type B timers that offer the following major features:

- A Type B Timer can be Concatenated with a Type C Timer to form a 32-Bit Timer
- External Clock Input (TxCK) is Always Synchronized to the Internal Device Clock and the Clock Synchronization is Performed after the Prescaler

Figure 13-1 shows a block diagram of the Type B timer.

Timer3 and Timer5 are Type C timers that offer the following major features:

- A Type C Timer can be Concatenated with a Type B Timer to form a 32-Bit Timer
- At Least One Type C Timer has the Ability to Trigger an Analog-to-Digital Conversion
- External Clock Input (TxCK) is Always Synchronized to the Internal Device Clock and the Clock Synchronization is Performed before the Prescaler

A block diagram of the Type C timer is shown in Figure 13-2.

**Note:** Timer3 is not available on all devices.

**FIGURE 13-1: TYPE B TIMER BLOCK DIAGRAM (x = 2, 4)**

**FIGURE 13-2: TYPE C TIMER BLOCK DIAGRAM (x = 3, 5)**

The Timer2/3/4/5 modules can operate in one of the following modes:

- Timer mode
- Gated Timer mode
- Synchronous Counter mode

In Timer and Gated Timer modes, the input clock is derived from the internal instruction cycle clock (Fcy). In Synchronous Counter mode, the input clock is derived from the external clock input at the TxCK pin.

The timer modes are determined by the following bits:

- TCS (TxCON<1>): Timer Clock Source Control bit
- TGATE (TxCON<6>): Timer Gate Control bit

Timer control bit settings for different operating modes are given in the [Table 13-1](#).

**TABLE 13-1: TIMER MODE SETTINGS**

| Mode                | TCS | TGATE |
|---------------------|-----|-------|
| Timer               | 0   | 0     |
| Gated Timer         | 0   | 1     |
| Synchronous Counter | 1   | x     |

## 13.1 16-Bit Operation

To configure any of the timers for individual 16-bit operation:

1. Clear the T32 bit corresponding to that timer.
2. Select the timer prescaler ratio using the TCKPS<1:0> bits.
3. Set the Clock and Gating modes using the TCS and TGATE bits.
4. Load the timer period value into the PRx register.
5. If interrupts are required, set the interrupt enable bit, TxIE. Use the priority bits, TxIP<2:0>, to set the interrupt priority.
6. Set the TON bit.

## 13.2 32-Bit Operation

A 32-bit timer module can be formed by combining a Type B and a Type C 16-bit timer module. For 32-bit timer operation, the T32 control bit in the Type B Timer Control (TxCON<3>) register must be set. The Type C timer holds the most significant word (msw) and the Type B timer holds the least significant word (lsw) for 32-bit operation.

When configured for 32-bit operation, only the Type B Timer Control (TxCON) register bits are required for setup and control while the Type C Timer Control register bits are ignored (except the TSIDL bit).

For interrupt control, the combined 32-bit timer uses the interrupt enable, interrupt flag and interrupt priority control bits of the Type C timer. The interrupt control and status bits for the Type B timer are ignored during 32-bit timer operation.

The timers that can be combined to form a 32-bit timer are listed in [Table 13-2](#).

**TABLE 13-2: 32-BIT TIMER**

| Type B Timer (lsw) | Type C Timer (msw) |
|--------------------|--------------------|
| Timer2             | Timer3             |
| Timer4             | Timer5             |

A block diagram representation of the 32-bit timer module is shown in [Figure 13-3](#). The 32-timer module can operate in one of the following modes:

- Timer mode
- Gated Timer mode
- Synchronous Counter mode

To configure the timer features for 32-bit operation:

1. Set the T32 control bit.
2. Select the prescaler ratio for Timer2 using the TCKPS<1:0> bits.
3. Set the Clock and Gating modes using the corresponding TCS and TGATE bits.
4. Load the timer period value. PR3 contains the most significant word of the value, while PR2 contains the least significant word.
5. If interrupts are required, set the interrupt enable bit, T3IE. Use the priority bits, T3IP<2:0>, to set the interrupt priority. While Timer2 controls the timer, the interrupt appears as a Timer3 interrupt.
6. Set the corresponding TON bit.

**Legend:**

R = Readable bit                      W = Writable bit                      U = Unimplemented bit, read as '0'  
-n = Value at POR                      '1' = Bit is set                      '0' = Bit is cleared                      x = Bit is unknown

- bit 15      **TON:** Timery On bit<sup>(2)</sup>  
1 = Starts 16-bit Timery  
0 = Stops 16-bit Timery
- bit 14      **Unimplemented:** Read as '0'
- bit 13      **TSIDL:** Timery Stop in Idle Mode bit<sup>(1)</sup>  
1 = Discontinues timer operation when device enters Idle mode  
0 = Continue timers operation in Idle mode
- bit 12-7    **Unimplemented:** Read as '0'
- bit 6      **TGATE:** Timery Gated Time Accumulation Enable bit<sup>(2)</sup>  
When TCS = 1:  
This bit is ignored.  
When TCS = 0:  
1 = Gated time accumulation is enabled  
0 = Gated time accumulation is disabled
- bit 5-4    **TCKPS<1:0>:** Timery Input Clock Prescale Select bits<sup>(2)</sup>  
11 = 1:256 prescale value  
10 = 1:64 prescale value  
01 = 1:8 prescale value  
00 = 1:1 prescale value
- bit 3-2    **Unimplemented:** Read as '0'
- bit 1      **TCS:** Timery Clock Source Select bit<sup>(2)</sup>  
1 = External clock from TxCK pin  
0 = Internal clock (FOSC/2)
- bit 0      **Unimplemented:** Read as '0'

- Note 1:** When 32-bit timer operation is enabled (T32 = 1) in the Timer Control register (TxCON<3>), the TSIDL bit must be cleared to operate the 32-bit timer in Idle mode.
- 2:** When the 32-bit timer operation is enabled (T32 = 1) in the Timer Control (TxCON<3>) register, these bits have no effect.

NOTES:

## 14.0 INPUT CAPTURE

**Note 1:** This data sheet summarizes the features of the dsPIC33FJ32GS406/606/608/610 and dsPIC33FJ64GS406/606/608/610 families of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 12. “Input Capture”** (DS70198) in the “dsPIC33F/PIC24H Family Reference Manual”, which is available from the Microchip web site ([www.microchip.com](http://www.microchip.com)).

**2:** Some registers and associated bits described in this section may not be available on all devices. Refer to **Section 4.0 “Memory Organization”** in this data sheet for device-specific register and bit information.

The input capture module is useful in applications requiring frequency (period) and pulse measurement. The dsPIC33FJ32GS406/606/608/610 and dsPIC33FJ64GS406/606/608/610 devices support up to two input capture channels.

The input capture module captures the 16-bit value of the selected Time Base register when an event occurs at the ICx pin. The events that cause a capture event are listed below in three categories:

- Simple Capture Event modes:
  - Capture timer value on every falling edge of input at ICx pin
  - Capture timer value on every rising edge of input at ICx pin
- Capture Timer Value on Every Edge (rising and falling)
- Prescaler Capture Event modes:
  - Capture timer value on every 4th rising edge of input at ICx pin
  - Capture timer value on every 16th rising edge of input at ICx pin

Each input capture channel can select one of the two 16-bit timers (Timer2 or Timer3) for the time base. The selected timer can use either an internal or external clock.

Other operational features include:

- Device Wake-up from Capture Pin during CPU Sleep and Idle modes
- Interrupt on Input Capture Event
- 4-Word FIFO Buffer for Capture Values
  - Interrupt optionally generated after 1, 2, 3 or 4 buffer locations are filled
- Use of Input Capture to provide Additional Sources of External Interrupts

## 15.0 OUTPUT COMPARE

**Note 1:** This data sheet summarizes the features of the dsPIC33FJ32GS406/606/608/610 and dsPIC33FJ64GS406/606/608/610 families of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 13. “Output Compare”** (DS70209) in the “dsPIC33F/PIC24H Family Reference Manual”, which is available from the Microchip website ([www.microchip.com](http://www.microchip.com)).

**2:** Some registers and associated bits described in this section may not be available on all devices. Refer to **Section 4.0 “Memory Organization”** in this data sheet for device-specific register and bit information.

The output compare module can select either Timer2 or Timer3 for its time base. The module compares the value of the timer with the value of one or two Compare registers depending on the operating mode selected. The state of the output pin changes when the timer value matches the Compare register value. The output compare module generates either a single output pulse, or a sequence of output pulses, by changing the state of the output pin on the compare match events. The output compare module can also generate interrupts on compare match events.

The output compare module has multiple operating modes:

- Active-Low One-Shot mode
- Active-High One-Shot mode
- Toggle mode
- Delayed One-Shot mode
- Continuous Pulse mode
- PWM mode without Fault Protection
- PWM mode with Fault Protection

**FIGURE 15-1: OUTPUT COMPARE MODULE BLOCK DIAGRAM**

## 15.1 Output Compare Modes

Configure the Output Compare modes by setting the appropriate Output Compare Mode (OCM<2:0>) bits in the Output Compare Control (OCxCON<2:0>) register. Table 15-1 lists the different bit settings for the Output Compare modes. Figure 15-2 illustrates the output compare operation for various modes. The user

application must disable the associated timer when writing to the Output Compare Control registers to avoid malfunctions.

**Note:** See Section 13. “Output Compare” (DS70209) in the “dsPIC33F/PIC24H Family Reference Manual” for OCxR and OCxRS register restrictions.

TABLE 15-1: OUTPUT COMPARE MODES

| OCM<2:0> | Mode                         | OCx Pin Initial State                          | OCx Interrupt Generation         |

NOTES:

## 16.0 HIGH-SPEED PWM

**Note 1:** This data sheet summarizes the features of the dsPIC33FJ32GS406/606/608/610 and dsPIC33FJ64GS406/606/608/610 families of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 43. “High-Speed PWM”** (DS70323) in the *“dsPIC33F/PIC24H Family Reference Manual”*, which is available from the Microchip web site ([www.microchip.com](http://www.microchip.com)).

**2:** Some registers and associated bits described in this section may not be available on all devices. Refer to **Section 4.0 “Memory Organization”** in this data sheet for device-specific register and bit information.

The High-Speed PWM module on the dsPIC33FJ32GS406/606/608/610 and dsPIC33FJ64GS406/606/608/610 devices supports a wide variety of PWM modes and output formats. This PWM module is ideal for power conversion applications, such as:

- AC/DC Converters
- DC/DC Converters
- Power Factor Correction
- Uninterruptible Power Supply (UPS)
- Inverters
- Battery Chargers
- Digital Lighting

### 16.1 Features Overview

The High-Speed PWM module incorporates the following features:

- Two Master Time Base modules
- Up to Nine PWM Generators with up to 18 Outputs
- Two PWM Outputs per PWM Generator
- Individual Time Base and Duty Cycle for each PWM Output
- Duty Cycle, Dead Time, Phase Shift and Frequency Resolution of 1.04 ns
- Independent Fault and Current-Limit Inputs for Eight PWM Outputs
- Redundant Output
- True Independent Output
- Center-Aligned PWM mode
- Output Override Control
- Chop mode (also known as Gated mode)
- Special Event Trigger
- Prescaler for Input Clock

- Dual Trigger from PWM to Analog-to-Digital Converter (ADC) per PWM Period
- PWMxL and PWMxH Output Pin Swapping
- Independent PWM Frequency, Duty Cycle and Phase Shift Changes
- Current Compensation
- Enhanced Leading-Edge Blanking (LEB) Functionality
- PWM Capture Functionality

**Note:** Duty cycle, dead-time, phase shift and frequency resolution is 8.32 ns in Center-Aligned PWM mode.

Figure 16-1 conceptualizes the PWM module in a simplified block diagram. Figure 16-2 illustrates how the module hardware is partitioned for each PWM output pair for the Complementary PWM mode.

The PWM module contains nine PWM generators. The module has up to 18 PWM output pins: PWM1H/PWM1L through PWM9H/PWM9L. For complementary outputs, these 18 I/O pins are grouped into high/low pairs.

### 16.2 Feature Description

The PWM module is designed for applications that require:

- High-resolution at high PWM frequencies
- The ability to drive Standard, Edge-Aligned, Center-Aligned Complementary mode, and Push-Pull mode outputs
- The ability to create multiphase PWM outputs

For Center-Aligned mode, the duty cycle, period phase and dead-time resolutions will be 8.32 ns.

Two common, medium power converter topologies are push-pull and half-bridge. These designs require the PWM output signal to be switched between alternate pins, as provided by the Push-Pull PWM mode.

Phase-shifted PWM describes the situation where each PWM generator provides outputs, but the phase relationship between the generator outputs is specifiable and changeable.

Multiphase PWM is often used to improve DC/DC Converter load transient response, and reduce the size of output filter capacitors and inductors. Multiple DC/DC Converters are often operated in parallel, but phase-shifted in time. A single PWM output operating at 250 kHz has a period of 4  $\mu$ s, but an array of four PWM channels, staggered by 1  $\mu$ s each, yields an effective switching frequency of 1 MHz. Multiphase PWM applications typically use a fixed-phase relationship.

Variable phase PWM is useful in Zero Voltage Transition (ZVT) power converters. Here, the PWM duty cycle is always 50%, and the power flow is controlled by varying the relative phase shift between the two PWM generators.

### 16.3 Control Registers

The following registers control the operation of the High-Speed PWM module.

- PTCN: PWM Time Base Control Register
- PTCN2: PWM Clock Divider Select Register 2
- PTPER: Primary Master Time Base Period Register<sup>(1,2)</sup>
- SEVTCMP: PWM Special Event Compare Register<sup>(1)</sup>
- STCON: PWM Secondary Master Time Base Control Register
- STCON2: PWM Secondary Clock Divider Select Register 2
- STPER: Secondary Master Time Base Period Register
- SSEVTCMP: PWM Secondary Special Event Compare Register
- CHOP: PWM Chop Clock Generator Register<sup>(1)</sup>
- MDC: PWM Master Duty Cycle Register<sup>(1,2)</sup>
- PWMCONx: PWM Control x Register
- PDCx: PWM Generator Duty Cycle x Register<sup>(1,2,3)</sup>
- PHASEx: PWM Primary Phase Shift x Register<sup>(1,2)</sup>
- DTRx: PWM Dead-Time x Register
- ALTDTRx: PWM Alternate Dead-Time x Register
- SDCx: PWM Secondary Duty Cycle x Register<sup>(1,2,3)</sup>
- SPHASEx: PWM Secondary Phase Shift x Register<sup>(1,2)</sup>
- TRGCONx: PWM Trigger Control x Register
- IOCONx: PWM I/O Control x Register
- FCLCONx: PWM Fault Current-Limit Control x Register
- TRIGx: PWM Primary Trigger x Compare Value Register
- STRIGx: PWM Secondary Trigger x Compare Value Register<sup>(1)</sup>
- LEBCONx: Leading-Edge Blanking Control x Register
- LEBDLYx: Leading-Edge Blanking Delay x Register
- AUXCONx: PWM Auxiliary Control x Register
- PWMCAPx: Primary PWM Time Base Capture x Register

| bit 7    |       |       |       | bit 0 |       |       |       |

**Legend:**

R = Readable bit

W = Writable bit

U = Unimplemented bit, read as '0'

-n = Value at POR

'1' = Bit is set

'0' = Bit is cleared

x = Bit is unknown

bit 15-0      **MDC<15:0>**: PWM Master Duty Cycle Value bits

**Note 1:** The smallest pulse width that can be generated on the PWM output corresponds to a value of 0x0008, while the maximum pulse width generated corresponds to a value of Period – 0x0008.

**2:** As the duty cycle gets closer to 0% or 100% of the PWM period (0 to 40 ns, depending on the mode of operation), the PWM duty cycle resolution will increase from 1 to 3 LSBs.

|-------------------|-----------------------------|------------------------------------|
| <b>Legend:</b>    | HC = Hardware Clearable bit | HS = Hardware Settable bit         |
| R = Readable bit  | W = Writable bit            | U = Unimplemented bit, read as '0' |
| -n = Value at POR | '1' = Bit is set            | '0' = Bit is cleared               |
|                   |                             | x = Bit is unknown                 |

- bit 15 **FLTSTAT:** Fault Interrupt Status bit<sup>(1)</sup>  
 1 = Fault interrupt is pending  
 0 = No Fault interrupt is pending  
 This bit is cleared by setting FLTIE = 0.
- bit 14 **CLSTAT:** Current-Limit Interrupt Status bit<sup>(1)</sup>  
 1 = Current-limit interrupt is pending  
 0 = No current-limit interrupt is pending  
 This bit is cleared by setting CLIE = 0.
- bit 13 **TRGSTAT:** Trigger Interrupt Status bit  
 1 = Trigger interrupt is pending  
 0 = No trigger interrupt is pending  
 This bit is cleared by setting TRGIE = 0.
- bit 12 **FLTIE:** Fault Interrupt Enable bit  
 1 = Fault interrupt is enabled  
 0 = Fault interrupt is disabled and FLTSTAT bit is cleared
- bit 11 **CLIE:** Current-Limit Interrupt Enable bit  
 1 = Current-limit interrupt is enabled  
 0 = Current-limit interrupt is disabled and CLSTAT bit is cleared
- bit 10 **TRGIE:** Trigger Interrupt Enable bit  
 1 = A trigger event generates an interrupt request  
 0 = Trigger event interrupts are disabled and TRGSTAT bit is cleared
- bit 9 **ITB:** Independent Time Base Mode bit<sup>(3)</sup>  
 1 = PHASEx/SPHASEx registers provide time base period for this PWM generator  
 0 = PTPER register provides timing for this PWM generator
- bit 8 **MDCS:** Master Duty Cycle Register Select bit<sup>(3)</sup>  
 1 = MDC register provides duty cycle information for this PWM generator  
 0 = PDCx and SDCx registers provide duty cycle information for this PWM generator

- Note 1:** Software must clear the interrupt status here and in the corresponding IFSx bit in the interrupt controller.
- 2:** The Independent Time Base mode (ITB = 1) must be enabled to use Center-Aligned mode. If ITB = 0, the CAM bit is ignored.
- 3:** These bits should not be changed after the PWM is enabled by setting PTEN (PTCON<15>) = 1.
- 4:** For DTCP to be effective, DTC<1:0> must be set to '11'; otherwise, DTCP is ignored.
- 5:** Center-Aligned mode ignores the Least Significant 3 bits of the Duty Cycle, Phase and Dead-Time registers. The highest Center-Aligned mode resolution available is 8.32 ns with the clock prescaler set to the fastest clock.
- 6:** Configure CLMOD (FCLCONX<8>) = 0 and ITB (PWMCONx<9>) = 1 to operate in External Period Reset mode.

**REGISTER 16-11: PWMCONx: PWM CONTROL x REGISTER (CONTINUED)**

- bit 7-6      **DTC<1:0>**: Dead-Time Control bits  
11 = Dead-Time Compensation mode  
10 = Dead-time function is disabled  
01 = Negative dead time is actively applied for Complementary Output mode  
00 = Positive dead time is actively applied for all output modes
- bit 5      **DTCP**: Dead-Time Compensation Polarity bit<sup>(4)</sup>  
1 = If DTCMPx = 0, PWMxL is shortened and PWMxH is lengthened  
    If DTCMPx = 1, PWMxH is shortened and PWMxL is lengthened  
0 = If DTCMPx = 0, PWMxH is shortened and PWMxL is lengthened  
    If DTCMPx = 1, PWMxL is shortened and PWMxH is lengthened
- bit 4      **Unimplemented**: Read as '0'
- bit 3      **MTBS**: Master Time Base Select bit  
1 = PWM generator uses the secondary master time base for synchronization and the clock source for the PWM generation logic (if secondary time base is available)  
0 = PWM generator uses the primary master time base for synchronization and the clock source for the PWM generation logic
- bit 2      **CAM**: Center-Aligned Mode Enable bit<sup>(2,3,5)</sup>  
1 = Center-Aligned mode is enabled  
0 = Edge-Aligned mode is enabled
- bit 1      **XPRES**: External PWM Reset Control bit<sup>(6)</sup>  
1 = Current-limit source resets the time base for this PWM generator if it is in Independent Time Base mode  
0 = External pins do not affect PWM time base
- bit 0      **IUE**: Immediate Update Enable bit  
1 = Updates to the active MDC/PDCx/SDCx registers are immediate  
0 = Updates to the active PDCx registers are synchronized to the PWM time base

- Note 1:** Software must clear the interrupt status here and in the corresponding IFSx bit in the interrupt controller.
- 2:** The Independent Time Base mode (ITB = 1) must be enabled to use Center-Aligned mode. If ITB = 0, the CAM bit is ignored.
- 3:** These bits should not be changed after the PWM is enabled by setting PTEN (PTCON<15>) = 1.
- 4:** For DTCP to be effective, DTC<1:0> must be set to '11'; otherwise, DTCP is ignored.
- 5:** Center-Aligned mode ignores the Least Significant 3 bits of the Duty Cycle, Phase and Dead-Time registers. The highest Center-Aligned mode resolution available is 8.32 ns with the clock prescaler set to the fastest clock.
- 6:** Configure CLMOD (FCLCONX<8>) = 0 and ITB (PWMCONx<9>) = 1 to operate in External Period Reset mode.

**REGISTER 16-12: PDCx: PWM GENERATOR DUTY CYCLE x REGISTER<sup>(1,2,3)</sup>**

|            |       |       |       |       |       |       |       |

| bit 7       |       |       |       | bit 0 |       |       |       |

### Legend:

R = Readable bit

W = Writable bit

U = Unimplemented bit, read as '0'

-n = Value at POR

'1' = Bit is set

'0' = Bit is cleared

x = Bit is unknown

bit 15-0      **PHASEx<15:0>**: PWM Phase Shift Value or Independent Time Base Period for the PWM Generator bits

**Note 1:** If PWMCONx<9> = 0, the following applies based on the mode of operation:

- Complementary, Redundant and Push-Pull Output mode (IOCONx<10:8> = 00, 01 or 10), PHASEx<15:0> = Phase Shift Value for PWMxH and PWMxL outputs.
- True Independent Output mode (IOCONx<10:8> = 11), PHASEx<15:0> = Phase Shift Value for PWMxH only.
- The PHASEx/SPHASEx registers provide the phase shift with respect to the master time base; therefore, the valid range is 0x0000 through period.

**2:** If PWMCONx<9> = 1, the following applies based on the mode of operation:

- Complementary, Redundant and Push-Pull Output mode (IOCONx<10:8> = 00, 01 or 10), PHASEx<15:0> = Independent Time Base Period Value for PWMxH and PWMxL.
- True Independent Output mode (IOCONx<10:8> = 11). PHASEx<15:0> = Independent Time Base Period Value for PWMxH only.
- When the PHASEx/SPHASEx registers provide the local period, the valid range is 0x0000 through 0xFF8.

**REGISTER 16-15: SPHASEx: PWM SECONDARY PHASE SHIFT x REGISTER<sup>(1,2)</sup>**

|               |       |       |       |       |       |       |       |
|---------------|-------|-------|-------|-------|-------|-------|-------|
| R/W-0         | R/W-0 | R/W-0 | R/W-0 | R/W-0 | R/W-0 | R/W-0 | R/W-0 |

**Legend:**

|                   |                  |                                              |
|-------------------|------------------|----------------------------------------------|
| R = Readable bit  | W = Writable bit | U = Unimplemented bit, read as '0'           |
| -n = Value at POR | '1' = Bit is set | '0' = Bit is cleared      x = Bit is unknown |

bit 15-0      **SPHASEx<15:0>**: Secondary Phase Offset bits for PWMxL Output Pin bits (used in Independent PWM mode only)

**Note 1:** If PWMCONx<9> = 0, the following applies based on the mode of operation:

- Complementary, Redundant and Push-Pull Output mode (IOCONx<10:8> = 00, 01 or 10), SPHASEx<15:0> = Not Used.
- True Independent Output mode (IOCONx<10:8> = 11), PHASEx<15:0> = Phase Shift Value for PWMxL only.
- The PHASEx/SPHASEx registers provide the phase shift with respect to the master time base; therefore, the valid range is 0x0000 through period.

**2:** If PWMCONx<9> = 1, the following applies based on the mode of operation:

- Complementary, Redundant and Push-Pull Output mode (IOCONx<10:8> = 00, 01 or 10), SPHASEx<15:0> = Not Used.
- True Independent Output mode (IOCONx<10:8> = 11). PHASEx<15:0> = Independent Time Base Period Value for PWMxL only.
- When the PHASEx/SPHASEx registers provide the local period, the valid range of values is 0x0010-0xFFFF8.

-n = Value at POR

'1' = Bit is set

'0' = Bit is cleared

x = Bit is unknown

bit 15-3 **PWMCAP<15:3>**: Captured PWM Time Base Value bits<sup>(1,2,3,4)</sup>

The value in this register represents the captured PWM time base value when a leading edge is detected on the current-limit input.

bit 2-0 **Unimplemented**: Read as '0'

**Note 1:** The capture feature is only available on the primary output (PWMxH).

**2:** This feature is active only after LEB processing on the current-limit input signal is complete.

**3:** The minimum capture resolution is 8.32 ns.

**4:** This feature can be used when the XPRES bit (PWMCONx<1>) is set to '0'.

## 17.0 QUADRATURE ENCODER INTERFACE (QEI) MODULE

**Note 1:** This data sheet summarizes the features of the dsPIC33FJ32GS406/606/608/610 and dsPIC33FJ64GS406/606/608/610 families of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 15. “Quadrature Encoder Interface (QEI)”** (DS70208) in the “dsPIC33F/PIC24H Family Reference Manual”, which is available from the Microchip web site ([www.microchip.com](http://www.microchip.com)).

**2:** Some registers and associated bits described in this section may not be available on all devices. Refer to **Section 4.0 “Memory Organization”** in this data sheet for device-specific register and bit information.

This chapter describes the Quadrature Encoder Interface (QEI) module and associated operational modes. The QEI module provides the interface to incremental encoders for obtaining mechanical position data.

The operational features of the QEI include:

- Three Input Channels for Two Phase Signals and Index Pulse
- 16-Bit Up/Down Position Counter
- Count Direction Status
- Position Measurement (x2 and x4) mode
- Programmable Digital Noise Filters on Inputs
- Alternate 16-Bit Timer/Counter mode
- Quadrature Encoder Interface Interrupts

These operating modes are determined by setting the appropriate bits, QEIM<2:0> in (QEIXCON<10:8>). **Figure 17-1** depicts the Quadrature Encoder Interface block diagram.

**Note:** An ‘x’ used in the names of pins, control/status bits and registers denotes a particular QEI module number (x = 1 or 2).

**FIGURE 17-1: QUADRATURE ENCODER INTERFACE x BLOCK DIAGRAM (x = 1 OR 2)**

R = Readable bit

W = Writable bit

U = Unimplemented bit, read as '0'

-n = Value at POR

'1' = Bit is set

'0' = Bit is cleared

x = Bit is unknown

bit 15 **CNTERR:** Count Error Status Flag bit<sup>(1)</sup>

1 = Position count error has occurred

0 = No position count error has occurred

bit 14 **Unimplemented:** Read as '0'

bit 13 **QEISIDL:** QEIx Stop in Idle Mode bit

1 = Discontinues module operation when device enters Idle mode

0 = Continues module operation in Idle mode

bit 12 **INDEX:** Index Pin State Status bit (read-only)

1 = Index pin is high

0 = Index pin is low

bit 11 **UPDN:** Position Counter Direction Status bit<sup>(2)</sup>

1 = Position counter direction is positive (+)

0 = Position counter direction is negative (-)

bit 10-8 **QEIM<2:0>:** Quadrature Encoder Interface Mode Select bits

111 = Quadrature Encoder Interface is enabled (x4 mode) with the position counter reset by the match (MAXxCNT)

110 = Quadrature Encoder Interface is enabled (x4 mode) with the Index Pulse Reset of the position counter

101 = Quadrature Encoder Interface is enabled (x2 mode) with the position counter reset by the match (MAXxCNT)

100 = Quadrature Encoder Interface is enabled (x2 mode) with the Index Pulse Reset of the position counter

011 = Unused (module disabled)

010 = Unused (module disabled)

001 = Starts 16-bit timer

000 = Quadrature Encoder Interface/timer off

bit 7 **SWPAB:** Phase A and Phase B Input Swap Select bit

1 = Phase A and Phase B inputs are swapped

0 = Phase A and Phase B inputs are not swapped

bit 6 **PCDOUT:** Position Counter Direction State Output Enable bit

1 = Position counter direction status output is enabled (QEI logic controls state of I/O pin)

0 = Position counter direction status output is disabled (normal I/O pin operation)

**Note 1:** CNTERR flag only applies when QEIM<2:0> = 110 or 100.

**2:** Read-only bit when QEIM<2:0> = 1xx. Read/write bit when QEIM<2:0> = 001.

**3:** Prescaler utilized for 16-Bit Timer mode only.

**4:** This bit applies only when QEIM<2:0> = 100 or 110.

**5:** When configured for QEI mode, this control bit is a 'don't care'.

111 = 1:256 clock divide

110 = 1:128 clock divide

101 = 1:64 clock divide

100 = 1:32 clock divide

011 = 1:16 clock divide

010 = 1:4 clock divide

001 = 1:2 clock divide

000 = 1:1 clock divide

bit 3-0 **Unimplemented:** Read as '0'

## 18.0 SERIAL PERIPHERAL INTERFACE (SPI)

**Note 1:** This data sheet summarizes the features of the dsPIC33FJ32GS406/606/608/610 and dsPIC33FJ64GS406/606/608/610 families of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 18. “Serial Peripheral Interface (SPI)”** (DS70206) in the “dsPIC33F/PIC24H Family Reference Manual”, which is available from the Microchip web site ([www.microchip.com](http://www.microchip.com)).

**2:** Some registers and associated bits described in this section may not be available on all devices. Refer to **Section 4.0 “Memory Organization”** in this data sheet for device-specific register and bit information.

The Serial Peripheral Interface (SPI) module is a synchronous serial interface useful for communicating with other peripheral or microcontroller devices. These peripheral devices can be serial EEPROMs, shift registers, display drivers, Analog-to-Digital Converters and so on. The SPI module is compatible with SPI and SIOP from Motorola®.

The SPI module consists of a 16-bit shift register, SPIxSR (where x = 1 or 2), used for shifting data in and out, and a buffer register, SPIxBUF. A control register, SPIxCON, configures the module. Additionally, a status register, SPIxSTAT, indicates status conditions.

The serial interface consists of these four pins:

- SDIx (Serial Data Input)
- SDOx (Serial Data Output)
- SCKx (Shift Clock Input Or Output)
- $\overline{SSx}$  (Active-Low Slave Select)

In Master mode operation, SCK is a clock output; in Slave mode, it is a clock input.

**FIGURE 18-1: SPI MODULE BLOCK DIAGRAM**

1 = Frame Sync pulse is active-high  
0 = Frame Sync pulse is active-low
- bit 12-2    **Unimplemented:** Read as '0'
- bit 1      **FRMDLY:** Frame Sync Pulse Edge Select bit  
1 = Frame Sync pulse coincides with first bit clock  
0 = Frame Sync pulse precedes first bit clock
- bit 0      **Unimplemented:** This bit must not be set to '1' by the user application

NOTES:

## 19.0 INTER-INTEGRATED CIRCUIT (I<sup>2</sup>C™)

**Note 1:** This data sheet summarizes the features of the dsPIC33FJ32GS406/606/608/610 and dsPIC33FJ64GS406/606/608/610 families of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 19. “Inter-Integrated Circuit (I<sup>2</sup>C™)”** (DS70195) in the “dsPIC33F/PIC24H Family Reference Manual”, which is available from the Microchip web site ([www.microchip.com](http://www.microchip.com)).

**2:** Some registers and associated bits described in this section may not be available on all devices. Refer to **Section 4.0 “Memory Organization”** in this data sheet for device-specific register and bit information.

The Inter-Integrated Circuit (I<sup>2</sup>C) module provides complete hardware support for both Slave and Multi-Master modes of the I<sup>2</sup>C serial communication standard with a 16-bit interface.

The I<sup>2</sup>C module has a 2-pin interface:

- The SCLx pin is clock.
- The SDAx pin is data.

The I<sup>2</sup>C module offers the following key features:

- I<sup>2</sup>C Interface Supporting Both Master and Slave modes of Operation
- I<sup>2</sup>C Slave mode Supports 7-Bit and 10-Bit Addressing
- I<sup>2</sup>C Master mode Supports 7-Bit and 10-Bit Addressing
- I<sup>2</sup>C Port allows Bidirectional Transfers Between Master and Slaves
- Serial Clock Synchronization for I<sup>2</sup>C Port can be used as a Handshake Mechanism to Suspend and Resume Serial Transfer (SCLREL control)
- I<sup>2</sup>C Supports Multi-Master Operation, Detects Bus Collision and Arbitrates Accordingly

## 19.1 Operating Modes

The hardware fully implements all the master and slave functions of the I<sup>2</sup>C Standard and Fast mode specifications, as well as 7-bit and 10-bit addressing.

The I<sup>2</sup>C module can operate either as a slave or a master on an I<sup>2</sup>C bus.

The following types of I<sup>2</sup>C operation are supported:

- I<sup>2</sup>C slave operation with 7-bit addressing
- I<sup>2</sup>C slave operation with 10-bit addressing
- I<sup>2</sup>C master operation with 7-bit or 10-bit addressing

For details about the communication sequence in each of these modes, refer to the “dsPIC33F/PIC24H Family Reference Manual”. Please see the Microchip web site ([www.microchip.com](http://www.microchip.com)) for the latest “dsPIC33F/PIC24H Family Reference Manual” sections.

## 19.2 I<sup>2</sup>C Registers

I2CxCON and I2CxSTAT are control and status registers, respectively. The I2CxCON register is readable and writable. The lower six bits of I2CxSTAT are read-only. The remaining bits of the I2CxSTAT are read/write:

- I2CxRSR is the shift register used for shifting data internal to the module and the user application has no access to it.
- I2CxRCV is the receive buffer and the register to which data bytes are written or from which data bytes are read.
- I2CxTRN is the transmit register to which bytes are written during a transmit operation.
- The I2CxADD register holds the slave address.
- A status bit, ADD10, indicates 10-Bit Addressing mode.
- The I2CxBRG acts as the Baud Rate Generator (BRG) reload value.

In receive operations, I2CxRSR and I2CxRCV together form a double-buffered receiver. When I2CxRSR receives a complete byte, it is transferred to I2CxRCV and an interrupt pulse is generated.

|-------------------|-----------------------------|------------------------------------|--------------------|
| <b>Legend:</b>    | HC = Hardware Clearable bit |                                    |                    |
| R = Readable bit  | W = Writable bit            | U = Unimplemented bit, read as '0' |                    |
| -n = Value at POR | '1' = Bit is set            | '0' = Bit is cleared               | x = Bit is unknown |

- bit 15      **I2CEN:** I2Cx Enable bit  
1 = Enables the I2Cx module and configures the SDAx and SCLx pins as serial port pins  
0 = Disables the I2Cx module; all I<sup>2</sup>C pins are controlled by port functions
- bit 14      **Unimplemented:** Read as '0'
- bit 13      **I2CSIDL:** I2Cx Stop in Idle Mode bit  
1 = Discontinues module operation when device enters Idle mode  
0 = Continues module operation in Idle mode
- bit 12      **SCLREL:** SCLx Release Control bit (when operating as I<sup>2</sup>C slave)  
1 = Releases SCLx clock  
0 = Holds SCLx clock low (clock stretch)  
If STREN = 1:  
Bit is R/W (i.e., software can write '0' to initiate stretch and write '1' to release clock). Hardware is clear at beginning of slave transmission. Hardware is clear at end of slave reception.  
If STREN = 0:  
Bit is R/S (i.e., software can only write '1' to release clock). Hardware is clear at beginning of slave transmission.
- bit 11      **IPMIEN:** Intelligent Peripheral Management Interface (IPMI) Enable bit  
1 = IPMI mode is enabled; all addresses are Acknowledged  
0 = IPMI mode is disabled
- bit 10      **A10M:** 10-Bit Slave Address bit  
1 = I2CxADD is a 10-bit slave address  
0 = I2CxADD is a 7-bit slave address
- bit 9      **DISSLW:** Disable Slew Rate Control bit  
1 = Slew rate control is disabled  
0 = Slew rate control is enabled
- bit 8      **SMEN:** SMBus Input Levels bit  
1 = Enables I/O pin thresholds compliant with SMBus specification  
0 = Disables SMBus input thresholds
- bit 7      **GCEN:** General Call Enable bit (when operating as I<sup>2</sup>C slave)  
1 = Enables interrupt when a general call address is received in the I2CxRSR (module is enabled for reception)  
0 = General call address is disabled
- bit 6      **STREN:** SCLx Clock Stretch Enable bit (when operating as I<sup>2</sup>C slave)  
Used in conjunction with the SCLREL bit.  
1 = Enables software or receives clock stretching  
0 = Disables software or receives clock stretching

## REGISTER 19-1: I2CxCON: I2Cx CONTROL REGISTER (CONTINUED)

- bit 5      **ACKDT:** Acknowledge Data bit (when operating as I<sup>2</sup>C master, applicable during master receive)  
Value that is transmitted when the software initiates an Acknowledge sequence.  
1 = Sends NACK during Acknowledge  
0 = Sends ACK during Acknowledge
- bit 4      **ACKEN:** Acknowledge Sequence Enable bit (when operating as I<sup>2</sup>C master, applicable during master receive)  
1 = Initiates Acknowledge sequence on SDAx and SCLx pins and transmits ACKDT data bit. Hardware clears at the end of the master Acknowledge sequence.  
0 = Acknowledge sequence is not in progress
- bit 3      **RCEN:** Receive Enable bit (when operating as I<sup>2</sup>C master)  
1 = Enables Receive mode for I<sup>2</sup>C. Hardware clears at the end of the eighth bit of the master receive data byte.  
0 = Receive sequence is not in progress
- bit 2      **PEN:** Stop Condition Enable bit (when operating as I<sup>2</sup>C master)  
1 = Initiates Stop condition on SDAx and SCLx pins. Hardware clears at the end of the master Stop sequence.  
0 = Stop condition is not in progress
- bit 1      **RSEN:** Repeated Start Condition Enable bit (when operating as I<sup>2</sup>C master)  
1 = Initiates Repeated Start condition on SDAx and SCLx pins. Hardware clears at the end of the master Repeated Start sequence.  
0 = Repeated Start condition is not in progress
- bit 0      **SEN:** Start Condition Enable bit (when operating as I<sup>2</sup>C master)  
1 = Initiates Start condition on SDAx and SCLx pins. Hardware clears at the end of the master Start sequence.  
0 = Start condition is not in progress

**REGISTER 19-2: I2CxSTAT: I2Cx STATUS REGISTER**

| bit 7     |           |          |            |            |          | bit 0    |          |

|                   |                   |                                    |                                       |
|-------------------|-------------------|------------------------------------|---------------------------------------|
| <b>Legend:</b>    | C = Clearable bit | U = Unimplemented bit, read as '0' |                                       |
| R = Readable bit  | W = Writable bit  | HS = Hardware Settable bit         | HSC = Hardware Settable/Clearable bit |
| -n = Value at POR | '1' = Bit is set  | '0' = Bit is cleared               | x = Bit is unknown                    |

- bit 15     **ACKSTAT:** Acknowledge Status bit (when operating as I<sup>2</sup>C master, applicable to master transmit operation)  
1 = NACK received from slave  
0 = ACK received from slave  
Hardware is set or clear at the end of slave Acknowledge.
- bit 14     **TRSTAT:** Transmit Status bit (when operating as I<sup>2</sup>C master, applicable to master transmit operation)  
1 = Master transmit is in progress (8 bits + ACK)  
0 = Master transmit is not in progress  
Hardware is set at the beginning of master transmission. Hardware is clear at the end of slave Acknowledge.
- bit 13-11     **Unimplemented:** Read as '0'
- bit 10     **BCL:** Master Bus Collision Detect bit  
1 = A bus collision has been detected during a master operation  
0 = No collision  
Hardware set at detection of bus collision.
- bit 9     **GCSTAT:** General Call Status bit  
1 = General call address was received  
0 = General call address was not received  
Hardware is set when the address matches the general call address. Hardware is clear at Stop detection.
- bit 8     **ADD10:** 10-Bit Address Status bit  
1 = 10-bit address was matched  
0 = 10-bit address was not matched  
Hardware is set at the match of the 2nd byte of matched 10-bit address. Hardware is clear at Stop detection.
- bit 7     **IWCOL:** Write Collision Detect bit  
1 = An attempt to write to the I2CxTRN register failed because the I<sup>2</sup>C module is busy  
0 = No collision  
Hardware is set at the occurrence of a write to I2CxTRN while busy (cleared by software).
- bit 6     **I2COV:** Receive Overflow Flag bit  
1 = A byte was received while the I2CxRCV register is still holding the previous byte  
0 = No overflow  
Hardware is set at an attempt to transfer I2CxRSR to I2CxRCV (cleared by software).
- bit 5     **D\_A:** Data/Address bit (when operating as I<sup>2</sup>C slave)  
1 = Indicates that the last byte received was data  
0 = Indicates that the last byte received was a device address  
Hardware is clear at a device address match. Hardware is set by reception of a slave byte.
- bit 4     **P:** Stop bit  
1 = Indicates that a Stop bit has been detected last  
0 = Stop bit was not detected last  
Hardware is set or clear when Start, Repeated Start or Stop is detected.

### REGISTER 19-2: I2CxSTAT: I2Cx STATUS REGISTER (CONTINUED)

- bit 3      **S:** Start bit  
1 = Indicates that a Start (or Repeated Start) bit has been detected last  
0 = Start bit was not detected last  
Hardware is set or clear when Start, Repeated Start or Stop is detected.
- bit 2      **R\_W:** Read/Write Information bit (when operating as I<sup>2</sup>C slave)  
1 = Read – indicates data transfer is output from slave  
0 = Write – indicates data transfer is input to slave  
Hardware is set or clear after reception of an I<sup>2</sup>C device address byte.
- bit 1      **RBF:** Receive Buffer Full Status bit  
1 = Receive is complete, I2CxRCV is full  
0 = Receive is not complete, I2CxRCV is empty  
Hardware is set when I2CxRCV is written with a received byte. Hardware is clear when software reads I2CxRCV.
- bit 0      **TBF:** Transmit Buffer Full Status bit  
1 = Transmit in progress, I2CxTRN is full  
0 = Transmit is complete, I2CxTRN is empty  
Hardware is set when software writes to I2CxTRN. Hardware is clear at completion of the data transmission.

**REGISTER 19-3: I2CxMSK: I2Cx SLAVE MODE ADDRESS MASK REGISTER**

| bit 7     |       |       |       |       |       | bit 0 |       |

**Legend:**

R = Readable bit

W = Writable bit

U = Unimplemented bit, read as '0'

-n = Value at POR

'1' = Bit is set

'0' = Bit is cleared

x = Bit is unknown

bit 15-10 **Unimplemented:** Read as '0'

bit 9-0 **AMSK<9:0>:** Mask for Address bit x Select bits

1 = Enables masking for bit x of incoming message address; bit match is not required in this position

0 = Disables masking for bit x; bit match is required in this position

NOTES:

## 20.0 UNIVERSAL ASYNCHRONOUS RECEIVER TRANSMITTER (UART)

**Note 1:** This data sheet summarizes the features of the dsPIC33FJ32GS406/606/608/610 and dsPIC33FJ64GS406/606/608/610 families of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 17. "UART"** (DS70188) in the "*dsPIC33F/PIC24H Family Reference Manual*", which is available from the Microchip web site ([www.microchip.com](http://www.microchip.com)).

**2:** Some registers and associated bits described in this section may not be available on all devices. Refer to **Section 4.0 "Memory Organization"** in this data sheet for device-specific register and bit information.

The Universal Asynchronous Receiver Transmitter (UART) module is one of the serial I/O modules available in the dsPIC33FJ32GS406/606/608/610 and dsPIC33FJ64GS406/606/608/610 device families. The UART is a full-duplex, asynchronous system that can communicate with peripheral devices, such as personal computers, LIN/JS2602, RS-232 and RS-485 interfaces. The module also supports a hardware flow control option with the  $\overline{\text{UxCTS}}$  and  $\overline{\text{UxRTS}}$  pins and also includes an IrDA encoder and decoder.

The primary features of the UARTx module are:

- Full-Duplex, 8-Bit or 9-Bit Data Transmission through the  $\text{UxTX}$  and  $\text{UxRX}$  Pins
- Even, Odd or No Parity Options (for 8-bit data)
- One or Two Stop bits
- Hardware Flow Control Option with  $\overline{\text{UxCTS}}$  and  $\overline{\text{UxRTS}}$  Pins
- Fully Integrated Baud Rate Generator with 16-Bit Prescaler
- Baud Rates Ranging from 10 Mbps to 38 bps at 40 MIPS
- Baud Rates Ranging from 12.5 Mbps to 47 bps at 50 MIPS
- 4-Deep, First-In First-Out (FIFO) Transmit Data Buffer
- 4-Deep FIFO Receive Data Buffer
- Parity, Framing and Buffer Overrun Error Detection
- Support for 9-Bit mode with Address Detect (9th bit = 1)
- Transmit and Receive Interrupts
- A Separate Interrupt for all UART Error Conditions
- Loopback mode for Diagnostic Support
- Support for Sync and Break Characters
- Support for Automatic Baud Rate Detection
- IrDA Encoder and Decoder Logic
- 16x Baud Clock Output for IrDA® Support
- Support for DMA

A simplified block diagram of the UART module is shown in **Figure 20-1**. The UART module consists of these key hardware elements:

- Baud Rate Generator
- Asynchronous Transmitter
- Asynchronous Receiver

**FIGURE 20-1: SIMPLIFIED UARTx BLOCK DIAGRAM**

|-------------------|-----------------------------|------------------------------------|--------------------|
| <b>Legend:</b>    | HC = Hardware Clearable bit |                                    |                    |
| R = Readable bit  | W = Writable bit            | U = Unimplemented bit, read as '0' |                    |
| -n = Value at POR | '1' = Bit is set            | '0' = Bit is cleared               | x = Bit is unknown |

- bit 15      **UARTEN:** UARTx Enable bit<sup>(1)</sup>  
1 = UARTx is enabled; all UARTx pins are controlled by UARTx as defined by UEN<1:0>  
0 = UARTx is disabled; all UARTx pins are controlled by port latches; UARTx power consumption minimal
- bit 14      **Unimplemented:** Read as '0'
- bit 13      **USIDL:** UARTx Stop in Idle Mode bit  
1 = Discontinues module operation when device enters Idle mode  
0 = Continues module operation in Idle mode
- bit 12      **IREN:** IrDA® Encoder and Decoder Enable bit<sup>(2)</sup>  
1 = IrDA encoder and decoder are enabled  
0 = IrDA encoder and decoder are disabled
- bit 11      **RTSMD:** Mode Selection for UxRTS Pin bit  
1 = UxRTS pin in Simplex mode  
0 = UxRTS pin in Flow Control mode
- bit 10      **Unimplemented:** Read as '0'
- bit 9-8      **UEN<1:0>:** UARTx Pin Enable bits  
11 = UxTX, UxRX and BCLK pins are enabled and used; UxCTS pin is controlled by port latches  
10 = UxTX, UxRX, UxCTS and UxRTS pins are enabled and used  
01 = UxTX, UxRX and UxRTS pins are enabled and used; UxCTS pin is controlled by port latches  
00 = UxTX and UxRX pins are enabled and used; UxCTS and UxRTS/BCLK pins are controlled by port latches
- bit 7      **WAKE:** Wake-up on Start bit Detect During Sleep Mode Enable bit  
1 = UARTx will continue to sample the UxRX pin; interrupt is generated on falling edge; bit is cleared in hardware on following rising edge  
0 = No wake-up is enabled
- bit 6      **LPBACK:** UARTx Loopback Mode Select bit  
1 = Enables Loopback mode  
0 = Loopback mode is disabled
- bit 5      **ABAUD:** Auto-Baud Enable bit  
1 = Enables baud rate measurement on the next character – requires reception of a Sync field (55h) before other data; cleared in hardware upon completion  
0 = Baud rate measurement is disabled or completed

**Note 1:** Refer to **Section 17. “UART”** (DS70188) in the “*dsPIC33F/PIC24H Family Reference Manual*” for information on enabling the UART module for receive or transmit operation. That section of the manual is available on the Microchip web site, [www.microchip.com](http://www.microchip.com).

**2:** This feature is only available for the 16x BRG mode (BRGH = 0).

## REGISTER 20-1: UxMODE: UARTx MODE REGISTER (CONTINUED)

- bit 15,13 **UTXISEL<1:0>**: UARTx Transmission Interrupt Mode Selection bits
- 11 = Reserved; do not use
  - 10 = Interrupt when a character is transferred to the Transmit Shift Register (TSR), and as a result, the transmit buffer becomes empty
  - 01 = Interrupt when the last character is shifted out of the Transmit Shift Register; all transmit operations are completed
  - 00 = Interrupt when a character is transferred to the Transmit Shift Register (this implies there is at least one character open in the transmit buffer)
- bit 14 **UTXINV**: UARTx Transmit Polarity Inversion bit
- If IREN = 0:
- 1 = UxTX Idle state is '0'
  - 0 = UxTX Idle state is '1'
- If IREN = 1:
- 1 = IrDA<sup>®</sup> encoded UxTX Idle state is '1'
  - 0 = IrDA encoded UxTX Idle state is '0'
- bit 12 **Unimplemented**: Read as '0'
- bit 11 **UTXBRK**: UARTx Transmit Break bit
- 1 = Sends Sync Break on next transmission – Start bit, followed by twelve '0' bits, followed by Stop bit; cleared by hardware upon completion
  - 0 = Sync Break transmission is disabled or completed
- bit 10 **UTXEN**: UARTx Transmit Enable bit<sup>(1)</sup>
- 1 = Transmit is enabled, UxTX pin is controlled by UARTx
  - 0 = Transmit is disabled, any pending transmission is aborted and the buffer is reset; UxTX pin is controlled by the port
- bit 9 **UTXBF**: UARTx Transmit Buffer Full Status bit (read-only)
- 1 = Transmit buffer is full
  - 0 = Transmit buffer is not full; at least one more character can be written
- bit 8 **TRMT**: Transmit Shift Register Empty bit (read-only)
- 1 = Transmit Shift Register is empty and transmit buffer is empty (the last transmission has completed)
  - 0 = Transmit Shift Register is not empty, a transmission is in progress or queued
- bit 7-6 **URXISEL<1:0>**: UARTx Receive Interrupt Mode Selection bits
- 11 = Interrupt is set on UxRSR transfer, making the receive buffer full (i.e., has 4 data characters)
  - 10 = Interrupt is set on UxRSR transfer, making the receive buffer 3/4 full (i.e., has 3 data characters)
  - 0x = Interrupt is set when any character is received and transferred from the UxRSR to the receive buffer; receive buffer has one or more characters

**Note 1:** Refer to **Section 17. “UART”** (DS70188) in the “dsPIC33F/PIC24H Family Reference Manual” for information on enabling the UART module for transmit operation. That section of the manual is available on the Microchip web site, [www.microchip.com](http://www.microchip.com).

**REGISTER 20-2: UxSTA: UARTx STATUS AND CONTROL REGISTER (CONTINUED)**

- bit 5      **ADDEN:** Address Character Detect bit (bit 8 of received data = 1)  
1 = Address Detect mode is enabled; if 9-bit mode is not selected, this does not take effect  
0 = Address Detect mode is disabled
- bit 4      **RIDLE:** Receiver Idle bit (read-only)  
1 = Receiver is Idle  
0 = Receiver is active
- bit 3      **PERR:** Parity Error Status bit (read-only)  
1 = Parity error has been detected for the current character (character at the top of the receive FIFO)  
0 = Parity error has not been detected
- bit 2      **FERR:** Framing Error Status bit (read-only)  
1 = Framing error has been detected for the current character (character at the top of the receive FIFO)  
0 = Framing error has not been detected
- bit 1      **OERR:** Receive Buffer Overrun Error Status bit (clear/read-only)  
1 = Receive buffer has overflowed  
0 = Receive buffer has not overflowed; clearing a previously set OERR bit (1 → 0 transition) will reset the receiver buffer and the UxRSR to the empty state
- bit 0      **URXDA:** UARTx Receive Buffer Data Available bit (read-only)  
1 = Receive buffer has data, at least one more character can be read  
0 = Receive buffer is empty

**Note 1:** Refer to **Section 17. “UART”** (DS70188) in the “*dsPIC33F/PIC24H Family Reference Manual*” for information on enabling the UART module for transmit operation. That section of the manual is available on the Microchip web site, [www.microchip.com](http://www.microchip.com).

NOTES:

## 21.0 ENHANCED CAN (ECAN™) MODULE

**Note 1:** This data sheet summarizes the features of the dsPIC33FJ32GS406/606/608/610 and dsPIC33FJ64GS406/606/608/610 families of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 21. “Enhanced Controller Area Network (ECAN™)”** (DS70185) in the *dsPIC33F/PIC24H Family Reference Manual*, which is available from the Microchip web site ([www.microchip.com](http://www.microchip.com)).

**2:** Some registers and associated bits described in this section may not be available on all devices. Refer to **Section 4.0 “Memory Organization”** in this data sheet for device-specific register and bit information.

- Programmable Wake-up Functionality with Integrated Low-Pass Filter
- Programmable Loopback mode Supports Self-Test Operation
- Signaling via Interrupt Capabilities for all CAN Receiver and Transmitter Error States
- Programmable Clock Source
- Programmable Link to Input Capture module (IC2 for CAN1) for Time-Stamping and Network Synchronization
- Low-Power Sleep and Idle mode

The CAN bus module consists of a protocol engine and message buffering/control. The CAN protocol engine handles all functions for receiving and transmitting messages on the CAN bus. Messages are transmitted by first loading the appropriate data registers. Status and errors can be checked by reading the appropriate registers. Any message detected on the CAN bus is checked for errors and then matched against filters to see if it should be received and stored in one of the receive registers.

### 21.1 Overview

The Enhanced Controller Area Network (ECAN™) module is a serial interface, useful for communicating with other CAN modules or microcontroller devices. This interface/protocol was designed to allow communications within noisy environments. The dsPIC33FJ32GS406/606/608/610 and dsPIC33FJ64GS406/606/608/610 devices contain up to two ECAN modules.

The ECAN module is a communication controller implementing the CAN 2.0 A/B protocol, as defined in the BOSCH CAN specification. The module supports CAN 1.2, CAN 2.0A, CAN 2.0B Passive and CAN 2.0B Active versions of the protocol. The module implementation is a full CAN system. The CAN specification is not covered within this data sheet. The reader can refer to the BOSCH CAN specification for further details.

The module features are as follows:

- Implementation of the CAN Protocol, CAN 1.2, CAN 2.0A and CAN 2.0B
- Standard and Extended Data Frames
- 0-8 Bytes Data Length
- Programmable Bit Rate, up to 1 Mbit/sec
- Automatic Response to Remote Transmission Requests
- Up to 8 Transmit Buffers with Application-Specified Prioritization and Abort Capability (each buffer can contain up to 8 bytes of data)
- Up to 32 Receive Buffers (each buffer can contain up to 8 bytes of data)
- Up to 16 Full (standard/extended identifier) Acceptance Filters
- Three Full Acceptance Filter Masks
- DeviceNet™ Addressing Support

### 21.2 Frame Types

The ECAN module transmits various types of frames which include data messages, or remote transmission requests initiated by the user, as other frames that are automatically generated for control purposes. The following frame types are supported:

- **Standard Data Frame:** A standard data frame is generated by a node when the node wishes to transmit data. It includes an 11-bit Standard Identifier (SID), but not an 18-bit Extended Identifier (EID).
- **Extended Data Frame:** An extended data frame is similar to a standard data frame, but includes an extended identifier as well.
- **Remote Frame:** It is possible for a destination node to request the data from the source. For this purpose, the destination node sends a remote frame with an identifier that matches the identifier of the required data frame. The appropriate data source node sends a data frame as a response to this remote request.
- **Error Frame:** An error frame is generated by any node that detects a bus error. An error frame consists of two fields: an error flag field and an error delimiter field.
- **Overload Frame:** An overload frame can be generated by a node as a result of two conditions. First, the node detects a dominant bit during inter-frame space which is an illegal condition. Second, due to internal conditions, the node is not yet able to start reception of the next message. A node can generate a maximum of 2 sequential overload frames to delay the start of the next message.
- **Interframe Space:** Interframe space separates a proceeding frame (of whatever type) from a following data or remote frame.

FIGURE 21-1: ECANx MODULE BLOCK DIAGRAM

## 21.3 Modes of Operation

The ECAN™ module can operate in one of several operation modes selected by the user. These modes include:

- Initialization mode
- Disable mode
- Normal Operation mode
- Listen Only mode
- Listen All Messages mode
- Loopback mode

Modes are requested by setting the REQOP<2:0> bits (CxCTRL1<10:8>). Entry into a mode is Acknowledged by monitoring the OPMODE<2:0> bits (CxCTRL1<7:5>). The module does not change the mode and the OPMODE bits until a change in mode is acceptable, generally during bus Idle time, which is defined as at least 11 consecutive recessive bits.

### 21.3.1 INITIALIZATION MODE

In the Initialization mode, the module does not transmit or receive. The error counters are cleared and the interrupt flags remain unchanged. The user application has access to Configuration registers that are access restricted in other modes. The module protects the user from accidentally violating the CAN protocol through programming errors. All registers which control the configuration of the module cannot be modified while the module is on-line. The ECAN module is not allowed to enter the Configuration mode while a transmission is taking place. The Configuration mode serves as a lock to protect the following registers:

- All Module Control Registers
- Baud Rate and Interrupt Configuration Registers
- Bus Timing Registers
- Identifier Acceptance Filter Registers
- Identifier Acceptance Mask Registers

### 21.3.2 DISABLE MODE

In Disable mode, the module does not transmit or receive. The module has the ability to set the WAKIF bit due to bus activity, however, any pending interrupts remain and the error counters retains their value.

If the REQOP<2:0> bits (CxCTRL1<10:8>) = 001, the module enters the Module Disable mode. If the module is active, the module waits for 11 recessive bits on the CAN bus, detects that condition as an Idle bus, then accepts the module disable command. When the OPMODE<2:0> bits (CxCTRL1<7:5>) = 001, that indicates whether the module successfully went into Module Disable mode. The I/O pins revert to normal I/O function when the module is in the Module Disable mode.

The module can be programmed to apply a low-pass filter function to the CxRX input line while the module or the CPU is in Sleep mode. The WAKFIL bit (CxCFG2<14>) enables or disables the filter.

**Note:** Typically, if the ECAN module is allowed to transmit in a particular mode of operation, and a transmission is requested immediately after the ECAN module has been placed in that mode of operation, the module waits for 11 consecutive recessive bits on the bus before starting transmission. If the user switches to Disable mode within this 11-bit period, then this transmission is aborted and the corresponding TXABTmn bit is set and the TXREQmn bit is cleared.

### 21.3.3 NORMAL OPERATION MODE

Normal Operation mode is selected when REQOP<2:0> = 000. In this mode, the module is activated and the I/O pins assume the CAN bus functions. The module transmits and receives CAN bus messages via the CxTX and CxRX pins.

### 21.3.4 LISTEN ONLY MODE

If the Listen Only mode is activated, the module on the CAN bus is passive. The transmitter buffers revert to the port I/O function. The receive pins remain inputs. For the receiver, no error flags or Acknowledge signals are sent. The error counters are deactivated in this state. The Listen Only mode can be used for detecting the baud rate on the CAN bus. To use this, it is necessary that there are at least two further nodes that communicate with each other.

### 21.3.5 LISTEN ALL MESSAGES MODE

The module can be set to ignore all errors and receive any message. The Listen All Messages mode is activated by setting REQOP<2:0> = 111. In this mode, the data, which is in the message assembly buffer until the time an error occurred, is copied in the receive buffer and can be read via the CPU interface.

### 21.3.6 LOOPBACK MODE

If the Loopback mode is activated, the module connects the internal transmit signal to the internal receive signal at the module boundary. The transmit and receive pins revert to their port I/O function.

#### Legend:

R = Readable bit

W = Writable bit

U = Unimplemented bit, read as '0'

-n = Value at POR

'1' = Bit is set

'0' = Bit is cleared

x = Bit is unknown

bit 15-8 See Definition for bits 7-0, Controls Buffer n

bit 7 **TXENm**: TX/RX Buffer Selection bit

1 = Buffer TRBn is a transmit buffer

0 = Buffer TRBn is a receive buffer

bit 6 **TXABTm**: Message Aborted bit<sup>(1)</sup>

1 = Message was aborted

0 = Message completed transmission successfully

bit 5 **TXLARBm**: Message Lost Arbitration bit<sup>(1)</sup>

1 = Message lost arbitration while being sent

0 = Message did not lose arbitration while being sent

bit 4 **TXERRm**: Error Detected During Transmission bit<sup>(1)</sup>

1 = A bus error occurred while the message was being sent

0 = A bus error did not occur while the message was being sent

bit 3 **TXREQm**: Message Send request bit

1 = Requests that a message be sent; the bit automatically clears when the message is successfully sent

0 = Clears the bit to '0'; while set, requests a message abort

bit 2 **RTRENm**: Auto-Remote Transmit Enable bit

1 = When a remote transmit is received, TXREQm will be set

0 = When a remote transmit is received, TXREQm will be unaffected

bit 1-0 **TXmPRI<1:0>**: Message Transmission Priority bits

11 = Highest message priority

10 = High intermediate message priority

01 = Low intermediate message priority

00 = Lowest message priority

**Note 1:** This bit is cleared when TXREQm is set.

**Note:** The buffers, SID, EID, DLC, Data Field, and Receive Status registers are located in DMA RAM.

## 21.4 ECANx Message Buffers

ECANx message buffers are part of DMA RAM memory. They are not ECAN Special Function Registers. The user application must directly write into the DMA RAM area that is configured for ECANx message buffers. The location and size of the buffer area is defined by the user application.

### BUFFER 21-1: ECANx MESSAGE BUFFER WORD 0

## 22.0 HIGH-SPEED, 10-BIT ANALOG-TO-DIGITAL CONVERTER (ADC)

**Note 1:** This data sheet summarizes the features of the dsPIC33FJ32GS406/606/608/610 and dsPIC33FJ64GS406/606/608/610 families of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 44. “High-Speed 10-Bit Analog-to-Digital Converter (ADC)”** (DS70321) in the “dsPIC33F/PIC24H Family Reference Manual”, which is available from the Microchip web site ([www.microchip.com](http://www.microchip.com)).

- 2:** Some registers and associated bits described in this section may not be available on all devices. Refer to **Section 4.0 “Memory Organization”** in this data sheet for device-specific register and bit information.

The dsPIC33FJ32GS406/606/608/610 and dsPIC33FJ64GS406/606/608/610 devices provide high-speed successive approximation Analog-to-Digital conversions to support applications such as AC/DC and DC/DC power converters.

### 22.1 Features Overview

The ADC module incorporates the following features:

- 10-Bit Resolution
- Unipolar Inputs
- Up to Two Successive Approximation Registers (SARs)
- Up to 24 External Input Channels
- Two Internal Analog Inputs
- Dedicated Result Register for each Analog Input
- $\pm 1$  LSB Accuracy at 3.3V
- Single Supply Operation
- 4 Msps Conversion Rate at 3.3V (devices with two SARs)
- 2 Msps Conversion Rate at 3.3V (devices with one SAR)
- Low-Power CMOS Technology

### 22.2 Module Description

This ADC module is designed for applications that require low latency between the request for conversion and the resultant output data. Typical applications include:

- AC/DC Power Supplies
- DC/DC Converters
- Power Factor Correction (PFC)

This ADC works with the High-Speed PWM module in power control applications that require high-frequency control loops. This module can Sample-and-Convert two analog inputs in a 0.5 microsecond when two SARs are used. This small conversion delay reduces the “phase lag” between measurement and control system response.

Up to five inputs may be sampled at a time (four inputs from the dedicated sample and hold circuits and one from the shared sample and hold circuit). If multiple inputs request conversion, the ADC will convert them in a sequential manner, starting with the lowest order input.

This ADC design provides each pair of analog inputs (AN1, AN0), (AN3, AN2),..., the ability to specify its own trigger source out of a maximum of sixteen different trigger sources. This capability allows this ADC to Sample-and-Convert analog inputs that are associated with PWM generators operating on independent time bases.

The user application typically requires synchronization between analog data sampling and PWM output to the application circuit. The very high-speed operation of this ADC module allows “data on demand”.

In addition, several hardware features have been added to the peripheral interface to improve real-time performance in a typical DSP-based application.

- Result Alignment Options
- Automated Sampling
- External Conversion Start Control
- Two Internal Inputs to Monitor the INTREF and EXTREF Input Signals

Block diagrams of the ADC module for the family devices are shown in [Figure 22-1](#) through [Figure 22-4](#).

## 22.3 Module Functionality

The High-Speed, 10-Bit ADC is designed to support power conversion applications when used with the High-Speed PWM module. The ADC may have one or two SAR modules, depending on the device variant. If two SARs are present on a device, two conversions can be processed at a time, yielding 4 Msps conversion rate. If only one SAR is present on a device, only one conversion can be processed at a time, yielding 2 Msps conversion rate. The High-Speed, 10-Bit ADC produces two 10-bit conversion results in a 0.5 microsecond.

The ADC module supports up to 24 external analog inputs and two internal analog inputs. To monitor reference voltage, two internal inputs, AN24 and AN25, are connected to EXTREF and INTREF, respectively.

The analog reference voltage is defined as the device supply voltage (AVDD/AVSS).

The ADC module uses the following control and status registers:

- [ADCON: ADC Control Register](#)
- [ADSTAT: ADC Status Register](#)
- [ADBASE: ADC Base Register<sup>\(1,2\)</sup>](#)
- [ADPCFG: ADC Port Configuration Register](#)
- [ADPCFG2: ADC Port Configuration Register 2](#)
- [ADCPC0: ADC Convert Pair Control Register 0](#)
- [ADCPC1: ADC Convert Pair Control Register 1](#)
- [ADCPC2: ADC Convert Pair Control Register 2](#)
- [ADCPC3: ADC Convert Pair Control Register 3](#)
- [ADCPC4: ADC Convert Pair Control Register 4](#)
- [ADCPC5: ADC Convert Pair Control Register 5](#)
- [ADCPC6: ADC Convert Pair Control Register 6\(2\)](#)

The ADCON register controls the operation of the ADC module. The ADSTAT register displays the status of the conversion processes. The ADPCFG registers configure the port pins as analog inputs or as digital I/O. The ADCPCx registers control the triggering of the ADC conversions. See [Register 22-1](#) through [Register 22-12](#) for detailed bit configurations.

|              |                                                                                                                                                                                 |
|--------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Note:</b> | A unique feature of the ADC module is its ability to sample inputs in an asynchronous manner. Individual sample and hold circuits can be triggered independently of each other. |
|--------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

| bit 7              |                        |                          |                           |     |                          |       | bit 0 |

**Legend:**

R = Readable bit

W = Writable bit

U = Unimplemented bit, read as '0'

-n = Value at POR

'1' = Bit is set

'0' = Bit is cleared

x = Bit is unknown

bit 15 **ADON:** ADC Module Operating Mode bit

1 = ADC module is operating

0 = ADC module is off

bit 14 **Unimplemented:** Read as '0'

bit 13 **ADSIDL:** ADC Stop in Idle Mode bit

1 = Discontinues module operation when device enters Idle mode

0 = Continues module operation in Idle mode

bit 12 **SLOWCLK:** Enable the Slow Clock Divider bit<sup>(1)</sup>

1 = ADC is clocked by the auxiliary PLL (ACLK)

0 = ADC is clock by the primary PLL (Fvco)

bit 11 **Unimplemented:** Read as '0'

bit 10 **GSWTRG:** Global Software Trigger bit

When this bit is set by the user, it will trigger conversions if selected by the TRGSRCx<4:0> bits in the ADCPCx registers. This bit must be cleared by the user prior to initiating another global trigger (i.e., this bit is not auto-clearing).

bit 9 **Unimplemented:** Read as '0'

bit 8 **FORM:** Data Output Format bit<sup>(1)</sup>

1 = Fractional (DOUT = dddd dddd dd00 0000)

0 = Integer (DOUT = 0000 00dd dddd dddd)

bit 7 **EIE:** Early Interrupt Enable bit<sup>(1)</sup>

1 = Interrupt is generated after first conversion is completed

0 = Interrupt is generated after second conversion is completed

bit 6 **ORDER:** Conversion Order bit<sup>(1,2)</sup>

1 = Odd numbered analog input is converted first, followed by conversion of even numbered input

0 = Even numbered analog input is converted first, followed by conversion of odd numbered input

bit 5 **SEQSAMP:** Sequential S&H Sampling Enable bit<sup>(1,2)</sup>

1 = Shared Sample and Hold (S&H) circuit is sampled at the start of the second conversion if ORDER = 0. If ORDER = 1, then the shared S&H is sampled at the start of the first conversion.

0 = Shared S&H is sampled at the same time the dedicated S&H is sampled if the shared S&H is not currently busy with an existing conversion process. If the shared S&H is busy at the time the dedicated S&H is sampled, then the shared S&H will sample at the start of the new conversion cycle.

bit 4 **ASYNC SAMP:** Asynchronous Dedicated S&H Sampling Enable bit<sup>(1)</sup>

1 = The dedicated S&H is constantly sampling and then terminates sampling as soon as the trigger pulse is detected

0 = The dedicated S&H starts sampling when the trigger event is detected and completes the sampling process in two ADC clock cycles

**Note 1:** This control bit can only be changed while the ADC is disabled (ADON = 0).

**2:** This control bit is only active on devices that have one SAR.

#### Legend:

R = Readable bit

W = Writable bit

U = Unimplemented bit, read as '0'

-n = Value at POR

'1' = Bit is set

'0' = Bit is cleared

x = Bit is unknown

bit 15-1      **ADBASE<15:1>**: ADC Base Address bits

This register contains the base address of the user's ADC Interrupt Service Routine jump table. This register, when read, contains the sum of the ADBASE register contents and the encoded value of the PxRDY status bits.

The encoder logic provides the bit number of the highest priority PxRDY bits where P0RDY is the highest priority and P6RDY is the lowest priority.

bit 0      **Unimplemented**: Read as '0'

**Note 1:** The encoding results are shifted left two bits so bits 1-0 of the result are always zero.

**2:** As an alternative to using the ADBASE register, the ADCP0-ADCP12 ADC pair conversion complete interrupts can be used to invoke Analog-to-Digital conversion completion routines for individual ADC input pairs.

NOTES:

## 23.0 HIGH-SPEED ANALOG COMPARATOR

**Note 1:** This data sheet summarizes the features of the dsPIC33FJ32GS406/606/608/610 and dsPIC33FJ64GS406/606/608/610 families of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 45. “High-Speed Analog Comparator”** (DS70296) in the “dsPIC33F/PIC24H Family Reference Manual”, which is available from the Microchip web site ([www.microchip.com](http://www.microchip.com)).

**2:** Some registers and associated bits described in this section may not be available on all devices. Refer to **Section 4.0 “Memory Organization”** in this data sheet for device-specific register and bit information.

The dsPIC33F Switch Mode Power Supply (SMPS) comparator module monitors current and/or voltage transients that may be too fast for the CPU and ADC to capture.

### 23.1 Features Overview

The SMPS comparator module offers the following major features:

- 16 Selectable Comparator Inputs
- Up to Four Analog Comparators
- 10-Bit DAC for each Analog Comparator

- Programmable Output Polarity
- Interrupt Generation Capability
- DACOUT Pin to provide DAC Output
- DAC has Three Ranges of Operation:
  - $AV_{DD}/2$
  - Internal Reference (INTREF)
  - External Reference (EXTREF)
- ADC Sample-and-Convert Trigger Capability
- Disable Capability reduces Power Consumption
- Functional Support for PWM module:
  - PWM duty cycle control
  - PWM period control
  - PWM Fault detect

### 23.2 Module Description

Figure 23-1 shows a functional block diagram of one analog comparator from the SMPS comparator module. The analog comparator provides high-speed operation with a typical delay of 20 ns. The comparator has a typical offset voltage of  $\pm 5$  mV. The negative input of the comparator is always connected to the DAC circuit. The positive input of the comparator is connected to an analog multiplexer that selects the desired source pin.

The analog comparator input pins are typically shared with pins used by the Analog-to-Digital Converter (ADC) module. Both the comparator and the ADC can use the same pins at the same time. This capability enables a user to measure an input voltage with the ADC and detect voltage transients with the comparator.

**FIGURE 23-1: HIGH-SPEED ANALOG COMPARATOR x MODULE BLOCK DIAGRAM**

## 23.3 Module Applications

This module provides a means for the SMPS dsPIC® DSC devices to monitor voltage and currents in a power conversion application. The ability to detect transient conditions and stimulate the dsPIC DSC processor and/or peripherals, without requiring the processor and ADC to constantly monitor voltages or currents, frees the dsPIC DSC to perform other tasks.

The comparator module has a high-speed comparator and an associated 10-bit DAC that provides a programmable reference voltage to the inverting input of the comparator. The polarity of the comparator output is user-programmable. The output of the module can be used in the following modes:

- Generate an Interrupt
- Trigger an ADC Sample-and-Convert Process
- Truncate the PWM Signal (current limit)
- Truncate the PWM Period (current minimum)
- Disable the PWM Outputs (Fault latch)

The output of the comparator module may be used in multiple modes at the same time, such as: 1) generate an interrupt, 2) have the ADC take a sample and convert it, and 3) truncate the PWM output in response to a voltage being detected beyond its expected value.

The comparator module can also be used to wake-up the system from Sleep or Idle mode when the analog input voltage exceeds the programmed threshold voltage.

## 23.4 DAC

The range of the DAC is controlled via an analog multiplexer that selects either  $AV_{DD}/2$ , an internal reference source, INTREF, or an external reference source, EXTREF. The full range of the DAC ( $AV_{DD}/2$ ) will typically be used when the chosen input source pin is shared with the ADC. The reduced range option (INTREF) will likely be used when monitoring current levels using a current sense resistor. Usually, the measured voltages in such applications are small ( $<1.25V$ ); therefore the option of using a reduced reference range for the comparator extends the available DAC resolution in these applications. The use of an external reference enables the user to connect to a reference that better suits their application.

DACOUT, shown in [Figure 23-1](#), can only be associated with a single comparator at a given time.

**Note:** It should be ensured in software that multiple DACOE bits are not set. The output on the DACOUT pin will be indeterminate if multiple comparators enable the DAC output.

## 23.5 Interaction with I/O Buffers

If the comparator module is enabled and a pin has been selected as the source for the comparator, then the chosen I/O pad must disable the digital input buffer associated with the pad to prevent excessive currents in the digital buffer due to analog input voltages.

## 23.6 Digital Logic

The CMPCONx register (see [Register 23-1](#)) provides the control logic that configures the comparator module. The digital logic provides a glitch filter for the comparator output to mask transient signals in less than two instruction cycles. In Sleep or Idle mode, the glitch filter is bypassed to enable an asynchronous path from the comparator to the interrupt controller. This asynchronous path can be used to wake-up the processor from Sleep or Idle mode.

The comparator can be disabled while in Idle mode if the CMPSIDL bit is set. If a device has multiple comparators, if any CMPSIDL bit is set, then the entire group of comparators will be disabled while in Idle mode. This behavior reduces complexity in the design of the clock control logic for this module.

The digital logic also provides a one Tcy width pulse generator for triggering the ADC and generating interrupt requests.

The CMPDACx (see [Register 23-2](#)) register provides the digital input value to the reference DAC.

If the module is disabled, the DAC and comparator are disabled to reduce power consumption.

## 23.7 Comparator Input Range

The comparator has a limitation for the input Common-Mode Range (CMR) of  $(AV_{DD} - 1.5V)$ , typical. This means that both inputs should not exceed this range. As long as one of the inputs is within the Common-Mode Range, the comparator output will be correct. However, any input exceeding the CMR limitation will cause the comparator input to be saturated.

If both inputs exceed the CMR, the comparator output will be indeterminate.

## 23.8 DAC Output Range

The DAC has a limitation for the maximum reference voltage input of  $(AV_{DD} - 1.6)$  volts. An external reference voltage input should not exceed this value or the reference DAC output will become indeterminate.

## 23.9 Comparator Registers

The comparator module is controlled by the following registers:

- [CMPCONx: Comparator Control x Register](#)
- [CMPDACx: Comparator DAC Control x Register](#)

'0' = Bit is cleared

x = Bit is unknown

bit 15-10 **Reserved:** Read as '0'

bit 9-0 **CMREF<9:0>:** Comparator Reference Voltage Select bits

1111111111 = (CMREF \* INTREF/1024) or (CMREF \* (AVDD/2)/1024) volts depending on the RANGE bit or (CMREF \* EXTREF/1024) if EXTREF is set

•  
•  
•

0000000000 = 0.0 volts

## 24.0 SPECIAL FEATURES

**Note 1:** This data sheet summarizes the features of the dsPIC33FJ32GS406/606/608/610 and dsPIC33FJ64GS406/606/608/610 devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to the “dsPIC33F/PIC24H Family Reference Manual”. Please see the Microchip web site ([www.microchip.com](http://www.microchip.com)) for the latest “dsPIC33F/PIC24H Family Reference Manual” sections.

**2:** Some registers and associated bits described in this section may not be available on all devices. Refer to **Section 4.0 “Memory Organization”** in this data sheet for device-specific register and bit information.

The dsPIC33FJ32GS406/606/608/610 and dsPIC33FJ64GS406/606/608/610 devices include several features intended to maximize application flexibility and reliability, and minimize cost through elimination of external components. These are:

- Flexible Configuration
- Watchdog Timer (WDT)
- Code Protection and CodeGuard™ Security
- JTAG Boundary Scan Interface
- In-Circuit Serial Programming™ (ICSP™)
- In-Circuit Emulation
- Brown-out Reset (BOR)

## 24.1 Configuration Bits

The dsPIC33FJ32GS406/606/608/610 and dsPIC33FJ64GS406/606/608/610 devices provide non-volatile memory implementations for device Configuration bits. Refer to **Section 25. “Device Configuration”** (DS70194) in the “dsPIC33F/PIC24H Family Reference Manual” for more information on this implementation.

The Configuration bits can be programmed (read as ‘0’), or left unprogrammed (read as ‘1’), to select various device configurations. These bits are mapped starting at program memory location 0xF80000.

The individual Configuration bit descriptions for the Configuration registers are shown in **Table 24-2**.

Note that address, 0xF80000, is beyond the user program memory space. It belongs to the configuration memory space (0x800000-0xFFFFF), which can only be accessed using Table Reads and Table Writes.

To prevent inadvertent configuration changes during code execution, all programmable Configuration bits are write-once. After a bit is initially programmed during a power cycle, it cannot be written again. Changing a device configuration requires that power to the device be cycled.

The device Configuration register map is shown in **Table 24-1**.

**TABLE 24-1: DEVICE CONFIGURATION REGISTER MAP**

| Address  | Name     | Bit 7                   | Bit 6                   | Bit 5                  | Bit 4                     | Bit 3        | Bit 2                  | Bit 1                     | Bit 0 |

## 24.2 On-Chip Voltage Regulator

The dsPIC33FJ32GS406/606/608/610 and dsPIC33FJ64GS406/606/608/610 devices power their core digital logic at a nominal 2.5V. This can create a conflict for designs that are required to operate at a higher typical voltage, such as 3.3V. To simplify system design, all devices in the dsPIC33FJ32GS406/606/608/610 and dsPIC33FJ64GS406/606/608/610 families incorporate an on-chip regulator that allows the device to run its core logic from VDD.

The regulator provides power to the core from the other VDD pins. When the regulator is enabled, a low-ESR (less than 5 ohms) capacitor (such as tantalum or ceramic) must be connected to the VCAP pin (Figure 24-1). This helps to maintain the stability of the regulator. The recommended value for the filter capacitor is provided in Table 27-13, located in Section 27.1 “DC Characteristics”.

**Note:** It is important for the low-ESR capacitor to be placed as close as possible to the VCAP pin.

On a POR, it takes approximately 20  $\mu$ s for the on-chip voltage regulator to generate an output voltage. During this time, designated as TSTARTUP, code execution is disabled. TSTARTUP is applied every time the device resumes operation after any power-down.

**FIGURE 24-1: CONNECTIONS FOR THE ON-CHIP VOLTAGE REGULATOR<sup>(1,2,3)</sup>**

## 24.3 Brown-out Reset (BOR)

The Brown-out Reset (BOR) module is based on an internal voltage reference circuit. The main purpose of the BOR module is to generate a device Reset when a brown-out condition occurs. Brown-out conditions are generally caused by glitches on the AC mains (for example, missing portions of the AC cycle waveform due to bad power transmission lines, or voltage sags due to excessive current draw when a large inductive load is turned on).

A BOR generates a Reset pulse, which resets the device. The BOR selects the clock source based on the device Configuration bit values (FNOSC<2:0> and POSCMD<1:0>).

If an oscillator mode is selected, the BOR activates the Oscillator Start-up Timer (OST). The system clock is held until OST expires. If the PLL is used, the clock is held until the LOCK bit (OSCCON<5>) is ‘1’.

Concurrently, the Power-up Timer (PWRT) Time-out (TPWRT) is applied before the internal Reset is released. If TPWRT = 0 and a crystal oscillator is being used, then a nominal delay of TFSCM = 100 is applied. The total delay in this case is TFSCM.

The BOR status bit (RCON<1>) is set to indicate that a BOR has occurred. The BOR circuit continues to operate while in Sleep or Idle modes and resets the device should VDD fall below the BOR threshold voltage.

## 24.4 Watchdog Timer (WDT)

For dsPIC33FJ32GS406/606/608/610 and dsPIC33FJ64GS406/606/608/610 devices, the WDT is driven by the LPRC oscillator. When the WDT is enabled, the clock source is also enabled.

### 24.4.1 PRESCALER/POSTSCALER

The nominal WDT clock source from LPRC is 32.767 kHz. This feeds a prescaler that can be configured for either 5-bit (divide-by-32) or 7-bit (divide-by-128) operation. The prescaler is set by the WDTPRE Configuration bit. With a 32.767 kHz input, the prescaler yields a nominal WDT Time-out (TWDT) period of 1 ms in 5-bit mode or 4 ms in 7-bit mode.

A variable postscaler divides down the WDT prescaler output and allows for a wide range of time-out periods. The postscaler is controlled by the WDTPST<3:0> Configuration bits (FWDT<3:0>), which allow the selection of 16 settings, from 1:1 to 1:32,768. Using the prescaler and postscaler, time-out periods, ranging from 1 ms to 131 seconds, can be achieved.

- On any device Reset
- On the completion of a clock switch, whether invoked by software (i.e., setting the OSWEN bit after changing the NOSC bits) or by hardware (i.e., Fail-Safe Clock Monitor)
- When a `PWRSAPV` instruction is executed (i.e., Sleep or Idle mode is entered)
- When the device exits Sleep or Idle mode to resume normal operation
- By a `CLRWDT` instruction during normal execution

## 24.4.2 SLEEP AND IDLE MODES

The WDT is enabled or disabled by the FWDTEN Configuration bit in the FWDT Configuration register. When the FWDTEN Configuration bit is set, the WDT is always enabled.

**Note:** If the WINDIS bit (FWDT<6>) is cleared, the CLRWDT instruction should be executed by the application software only during the last 1/4 of the WDT period. This CLRWDT window can be determined by using a timer. If a CLRWDT instruction is executed before this window, a WDT Reset occurs.

**FIGURE 24-2: WDT BLOCK DIAGRAM**

## 24.5 JTAG Interface

dsPIC33FJ32GS406/606/608/610 and dsPIC33FJ64GS406/606/608/610 devices implement a JTAG interface, which supports boundary scan device testing, as well as in-circuit programming. Detailed information on this interface will be provided in future revisions of the document.

## 24.6 In-Circuit Serial Programming

dsPIC33FJ32GS406/606/608/610 and dsPIC33FJ64GS406/606/608/610 family Digital Signal Controllers (DSCs) can be serially programmed while in the end application circuit. This is done with two lines for clock and data and three other lines for power, ground and the programming sequence. Serial programming allows customers to manufacture boards with unprogrammed devices and then program the Digital Signal Controller just before shipping the product. Serial programming also allows the most recent firmware or a custom firmware to be programmed. Refer to the “*dsPIC33F/PIC24H Flash Programming Specification*” (DS70152) for details about In-Circuit Serial Programming™ (ICSP™).

Any of the three pairs of programming clock/data pins can be used:

- PGEC1 and PGED1
- PGEC2 and PGED2
- PGEC3 and PGED3

## 24.7 In-Circuit Debugger

When MPLAB ICD 3 is selected as a debugger, the in-circuit debugging functionality is enabled. This function allows simple debugging functions when used with MPLAB® IDE. Debugging functionality is controlled through the EMUCx (Emulation/Debug Clock) and EMUDx (Emulation/Debug Data) pin functions.

Any of the three pairs of debugging clock/data pins can be used:

- PGEC1 and PGED1
- PGEC2 and PGED2
- PGEC3 and PGED3

To use the in-circuit debugger function of the device, the design must implement ICSP connections to MCLR, VDD, VSS, PGECx, PGEDx and the EMUDx/EMUCx pin pair. In addition, when the feature is enabled, some of the resources are not available for general use. These resources include the first 80 bytes of data RAM and two I/O pins.

## 24.8 Code Protection and CodeGuard™ Security

The dsPIC33FJ32GS406/606/608/610 and dsPIC33FJ64GS406/606/608/610 devices offer the intermediate implementation of CodeGuard™ Security. CodeGuard Security enables multiple parties to securely share resources (memory, interrupts and peripherals) on a single chip. This feature helps protect individual Intellectual Property in collaborative system designs.

When coupled with software encryption libraries, CodeGuard Security can be used to securely update Flash even when multiple IPs reside on a single chip.

The code protection features are controlled by the Configuration registers: FBS and FGS.

Secure segment and RAM protection is not implemented in dsPIC33FJ32GS406/606/608/610 and dsPIC33FJ64GS406/606/608/610 devices.

**Note:** Refer to **Section 23. “CodeGuard™ Security”** (DS70199) in the “dsPIC33F/PIC24H Family Reference Manual” for further information on usage, configuration and operation of CodeGuard Security.

## 25.0 INSTRUCTION SET SUMMARY

**Note:** This data sheet summarizes the features of the dsPIC33FJ32GS406/606/608/610 and dsPIC33FJ64GS406/606/608/610 devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to the *“dsPIC33F/PIC24H Family Reference Manual”*. Please see the Microchip web site ([www.microchip.com](http://www.microchip.com)) for the latest *“dsPIC33F/PIC24H Family Reference Manual”* sections.

The dsPIC33F instruction set is identical to that of the dsPIC30F.

Most instructions are a single program memory word (24 bits). Only three instructions require two program memory locations.

Each single-word instruction is a 24-bit word, divided into an 8-bit opcode, which specifies the instruction type and one or more operands, which further specify the operation of the instruction.

The instruction set is highly orthogonal and is grouped into five basic categories:

- Word or byte-oriented operations
- Bit-oriented operations
- Literal operations
- DSP operations
- Control operations

Table 25-1 shows the general symbols used in describing the instructions.

The dsPIC33F instruction set summary in Table 25-2 lists all the instructions, along with the status flags affected by each instruction.

Most word or byte-oriented W register instructions (including barrel shift instructions) have three operands:

- The first source operand, which is typically a register 'Wb' without any address modifier
- The second source operand, which is typically a register 'Ws' with or without an address modifier
- The destination of the result, which is typically a register 'Wd' with or without an address modifier

However, word or byte-oriented file register instructions have two operands:

- The file register specified by the value, 'f'
- The destination, which could be either the file register, 'f', or the W0 register, which is denoted as 'WREG'

Most bit-oriented instructions (including simple rotate/shift instructions) have two operands:

- The W register (with or without an address modifier) or file register (specified by the value of 'Ws' or 'f')
- The bit in the W register or file register (specified by a literal value or indirectly by the contents of register 'Wb')

The literal instructions that involve data movement can use some of the following operands:

- A literal value to be loaded into a W register or file register (specified by 'k')
- The W register or file register where the literal value is to be loaded (specified by 'Wb' or 'f')

However, literal instructions that involve arithmetic or logical operations use some of the following operands:

- The first source operand, which is a register 'Wb' without any address modifier
- The second source operand, which is a literal value
- The destination of the result (only if not the same as the first source operand), which is typically a register 'Wd' with or without an address modifier

The MAC class of DSP instructions can use some of the following operands:

- The accumulator (A or B) to be used (required operand)
- The W registers to be used as the two operands
- The X and Y address space prefetch operations
- The X and Y address space prefetch destinations
- The accumulator write-back destination

The other DSP instructions do not involve any multiplication and can include:

- The accumulator to be used (required)
- The source or destination operand (designated as Wso or Wdo, respectively) with or without an address modifier
- The amount of shift specified by a W register, 'Wn', or a literal value

The control instructions can use some of the following operands:

- A program memory address
- The mode of the Table Read and Table Write instructions

# dsPIC33FJ32GS406/606/608/610 and dsPIC33FJ64GS406/606/608/610

Most instructions are a single word. Certain double-word instructions are designed to provide all the required information in these 48 bits. In the second word, the 8 MSBs are '0's. If this second word is executed as an instruction (by itself), it will execute as a NOP.

The double-word instructions execute in two instruction cycles.

Most single-word instructions are executed in a single instruction cycle, unless a conditional test is true, or the Program Counter is changed as a result of the instruction. In these cases, the execution takes two instruction cycles with the additional instruction cycle(s) executed as a NOP. Notable exceptions are the BRA

(unconditional/computed branch), indirect CALL/GOTO, all Table Reads and Writes, and RETURN/RETFIE instructions, which are single-word instructions but take two or three cycles. Certain instructions that involve skipping over the subsequent instruction require either two or three cycles if the skip is performed, depending on whether the instruction being skipped is a single-word or two-word instruction. Moreover, double-word moves require two cycles.

**Note:** For more details on the instruction set, refer to the "16-bit MCU and DSC Programmer's Reference Manual" (DS70157).

**TABLE 25-1: SYMBOLS USED IN OPCODE DESCRIPTIONS**

| Field           | Description                                                                               |
|-----------------|-------------------------------------------------------------------------------------------|
| #text           | Means "literal defined by text"                                                           |
| (text)          | Means "content of text"                                                                   |
| [text]          | Means "the location addressed by text"                                                    |
| { }             | Optional field or operation                                                               |
| <n:m>           | Register bit field                                                                        |
| .b              | Byte mode selection                                                                       |
| .d              | Double-Word mode selection                                                                |
| .S              | Shadow register select                                                                    |
| .w              | Word mode selection (default)                                                             |
| Acc             | One of two accumulators {A, B}                                                            |
| AWB             | Accumulator Write-Back Destination Address register $\in \{W13, [W13]+ = 2\}$             |
| bit4            | 4-bit bit selection field (used in word-addressed instructions) $\in \{0...15\}$          |
| C, DC, N, OV, Z | MCU Status bits: Carry, Digit Carry, Negative, Overflow, Sticky Zero                      |
| Expr            | Absolute address, label or expression (resolved by the linker)                            |
| f               | File register address $\in \{0x0000...0x1FFF\}$                                           |
| lit1            | 1-bit unsigned literal $\in \{0,1\}$                                                      |
| lit4            | 4-bit unsigned literal $\in \{0...15\}$                                                   |
| lit5            | 5-bit unsigned literal $\in \{0...31\}$                                                   |
| lit8            | 8-bit unsigned literal $\in \{0...255\}$                                                  |
| lit10           | 10-bit unsigned literal $\in \{0...255\}$ for Byte mode, $\{0:1023\}$ for Word mode       |
| lit14           | 14-bit unsigned literal $\in \{0...16384\}$                                               |
| lit16           | 16-bit unsigned literal $\in \{0...65535\}$                                               |
| lit23           | 23-bit unsigned literal $\in \{0...8388608\}$ ; LSb must be '0'                           |
| None            | Field does not require an entry, can be blank                                             |
| OA, OB, SA, SB  | DSP Status bits: ACCA Overflow, ACCB Overflow, ACCA Saturate, ACCB Saturate               |
| PC              | Program Counter                                                                           |
| Slit10          | 10-bit signed literal $\in \{-512...511\}$                                                |
| Slit16          | 16-bit signed literal $\in \{-32768...32767\}$                                            |
| Slit6           | 6-bit signed literal $\in \{-16...16\}$                                                   |
| Wb              | Base W register $\in \{W0..W15\}$                                                         |
| Wd              | Destination W register $\in \{Wd, [Wd], [Wd++], [Wd--], [++Wd], [--Wd]\}$                 |
| Wdo             | Destination W register $\in \{Wnd, [Wnd], [Wnd++], [Wnd--], [++Wnd], [--Wnd], [Wnd+Wb]\}$ |
| Wm, Wn          | Dividend, Divisor Working register pair (Direct Addressing)                               |

**TABLE 25-1: SYMBOLS USED IN OPCODE DESCRIPTIONS (CONTINUED)**

| Field | Description                                                                                                                                                                                                                                                                 |
|-------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Wm*Wm | Multiplicand and Multiplier Working register pair for Square instructions $\in \{W4 * W4, W5 * W5, W6 * W6, W7 * W7\}$                                                                                                                                                      |
| Wm*Wn | Multiplicand and Multiplier Working register pair for DSP instructions $\in \{W4 * W5, W4 * W6, W4 * W7, W5 * W6, W5 * W7, W6 * W7\}$                                                                                                                                       |
| Wn    | One of 16 Working registers $\in \{W0..W15\}$                                                                                                                                                                                                                               |
| Wnd   | One of 16 Destination Working registers $\in \{W0...W15\}$                                                                                                                                                                                                                  |
| Wns   | One of 16 Source Working registers $\in \{W0...W15\}$                                                                                                                                                                                                                       |
| WREG  | W0 (Working register used in file register instructions)                                                                                                                                                                                                                    |
| Ws    | Source W register $\in \{Ws, [Ws], [Ws++] , [Ws--], [++Ws], [--Ws] \}$                                                                                                                                                                                                      |
| Wso   | Source W register $\in \{Wns, [Wns], [Wns++] , [Wns--], [++Wns], [--Wns], [Wns+Wb] \}$                                                                                                                                                                                      |
| Wx    | X Data Space Prefetch Address register for DSP instructions<br>$\in \{[W8] + = 6, [W8] + = 4, [W8] + = 2, [W8], [W8] - = 6, [W8] - = 4, [W8] - = 2, [W9] + = 6, [W9] + = 4, [W9] + = 2, [W9], [W9] - = 6, [W9] - = 4, [W9] - = 2, [W9 + W12], \text{none}\}$                |
| Wxd   | X Data Space Prefetch Destination register for DSP instructions $\in \{W4...W7\}$                                                                                                                                                                                           |
| Wy    | Y Data Space Prefetch Address register for DSP instructions<br>$\in \{[W10] + = 6, [W10] + = 4, [W10] + = 2, [W10], [W10] - = 6, [W10] - = 4, [W10] - = 2, [W11] + = 6, [W11] + = 4, [W11] + = 2, [W11], [W11] - = 6, [W11] - = 4, [W11] - = 2, [W11 + W12], \text{none}\}$ |
| Wyd   | Y Data Space Prefetch Destination register for DSP instructions $\in \{W4...W7\}$                                                                                                                                                                                           |

**TABLE 25-2: INSTRUCTION SET OVERVIEW**

| Base Instr # | Assembly Mnemonic | Assembly Syntax             | Description                                                                     | # of Words | # of Cycles | Status Flags Affected |
|--------------|-------------------|-----------------------------|---------------------------------------------------------------------------------|------------|-------------|-----------------------|
| 1            | ADD               | ADD <i>Acc</i>              | Add Accumulators                                                                | 1          | 1           | OA,OB,SA,SB           |
|              |                   | ADD <i>f</i>                | $f = f + \text{WREG}$                                                           | 1          | 1           | C,DC,N,OV,Z           |
|              |                   | ADD <i>f, WREG</i>          | $\text{WREG} = f + \text{WREG}$                                                 | 1          | 1           | C,DC,N,OV,Z           |

## **26.0 DEVELOPMENT SUPPORT**

The PIC® microcontrollers and dsPIC® digital signal controllers are supported with a full range of software and hardware development tools:

- Integrated Development Environment
  - MPLAB® IDE Software
- Compilers/Assemblers/Linkers
  - MPLAB C Compiler for Various Device Families
  - HI-TECH C® for Various Device Families
  - MPASM™ Assembler
  - MPLINK™ Object Linker/  
MPLIB™ Object Librarian
  - MPLAB Assembler/Linker/Librarian for Various Device Families
- Simulators
  - MPLAB SIM Software Simulator
- Emulators
  - MPLAB REAL ICE™ In-Circuit Emulator
- In-Circuit Debuggers
  - MPLAB ICD 3
  - PICKit™ 3 Debug Express
- Device Programmers
  - PICKit™ 2 Programmer
  - MPLAB PM3 Device Programmer
- Low-Cost Demonstration/Development Boards, Evaluation Kits, and Starter Kits

## **26.1 MPLAB Integrated Development Environment Software**

The MPLAB IDE software brings an ease of software development previously unseen in the 8/16/32-bit microcontroller market. The MPLAB IDE is a Windows® operating system-based application that contains:

- A single graphical interface to all debugging tools
  - Simulator
  - Programmer (sold separately)
  - In-Circuit Emulator (sold separately)
  - In-Circuit Debugger (sold separately)
- A full-featured editor with color-coded context
- A multiple project manager
- Customizable data windows with direct edit of contents
- High-level source code debugging
- Mouse over variable inspection
- Drag and drop variables from source to watch windows
- Extensive on-line help
- Integration of select third party tools, such as IAR C Compilers

The MPLAB IDE allows you to:

- Edit your source files (either C or assembly)
- One-touch compile or assemble, and download to emulator and simulator tools (automatically updates all project information)
- Debug using:
  - Source files (C or assembly)
  - Mixed C and assembly
  - Machine code

MPLAB IDE supports multiple debugging tools in a single development paradigm, from the cost-effective simulators, through low-cost in-circuit debuggers, to full-featured emulators. This eliminates the learning curve when upgrading to tools with increased flexibility and power.

## 26.2 MPLAB C Compilers for Various Device Families

The MPLAB C Compiler code development systems are complete ANSI C compilers for Microchip's PIC18, PIC24 and PIC32 families of microcontrollers and the dsPIC30 and dsPIC33 families of digital signal controllers. These compilers provide powerful integration capabilities, superior code optimization and ease of use.

For easy source level debugging, the compilers provide symbol information that is optimized to the MPLAB IDE debugger.

## 26.3 HI-TECH C for Various Device Families

The HI-TECH C Compiler code development systems are complete ANSI C compilers for Microchip's PIC family of microcontrollers and the dsPIC family of digital signal controllers. These compilers provide powerful integration capabilities, omniscient code generation and ease of use.

For easy source level debugging, the compilers provide symbol information that is optimized to the MPLAB IDE debugger.

The compilers include a macro assembler, linker, pre-processor, and one-step driver, and can run on multiple platforms.

## 26.4 MPASM Assembler

The MPASM Assembler is a full-featured, universal macro assembler for PIC10/12/16/18 MCUs.

The MPASM Assembler generates relocatable object files for the MPLINK Object Linker, Intel® standard HEX files, MAP files to detail memory usage and symbol reference, absolute LST files that contain source lines and generated machine code and COFF files for debugging.

The MPASM Assembler features include:

- Integration into MPLAB IDE projects
- User-defined macros to streamline assembly code
- Conditional assembly for multi-purpose source files
- Directives that allow complete control over the assembly process

## 26.5 MPLINK Object Linker/ MPLIB Object Librarian

The MPLINK Object Linker combines relocatable objects created by the MPASM Assembler and the MPLAB C18 C Compiler. It can link relocatable objects from precompiled libraries, using directives from a linker script.

The MPLIB Object Librarian manages the creation and modification of library files of precompiled code. When a routine from a library is called from a source file, only the modules that contain that routine will be linked in with the application. This allows large libraries to be used efficiently in many different applications.

The object linker/library features include:

- Efficient linking of single libraries instead of many smaller files
- Enhanced code maintainability by grouping related modules together
- Flexible creation of libraries with easy module listing, replacement, deletion and extraction

## 26.6 MPLAB Assembler, Linker and Librarian for Various Device Families

MPLAB Assembler produces relocatable machine code from symbolic assembly language for PIC24, PIC32 and dsPIC devices. MPLAB C Compiler uses the assembler to produce its object file. The assembler generates relocatable object files that can then be archived or linked with other relocatable object files and archives to create an executable file. Notable features of the assembler include:

- Support for the entire device instruction set
- Support for fixed-point and floating-point data
- Command line interface
- Rich directive set
- Flexible macro language
- MPLAB IDE compatibility

## **26.7 MPLAB SIM Software Simulator**

The MPLAB SIM Software Simulator allows code development in a PC-hosted environment by simulating the PIC MCUs and dsPIC® DSCs on an instruction level. On any given instruction, the data areas can be examined or modified and stimuli can be applied from a comprehensive stimulus controller. Registers can be logged to files for further run-time analysis. The trace buffer and logic analyzer display extend the power of the simulator to record and track program execution, actions on I/O, most peripherals and internal registers.

The MPLAB SIM Software Simulator fully supports symbolic debugging using the MPLAB C Compilers, and the MPASM and MPLAB Assemblers. The software simulator offers the flexibility to develop and debug code outside of the hardware laboratory environment, making it an excellent, economical software development tool.

## **26.8 MPLAB REAL ICE In-Circuit Emulator System**

MPLAB REAL ICE In-Circuit Emulator System is Microchip's next generation high-speed emulator for Microchip Flash DSC and MCU devices. It debugs and programs PIC® Flash MCUs and dsPIC® Flash DSCs with the easy-to-use, powerful graphical user interface of the MPLAB Integrated Development Environment (IDE), included with each kit.

The emulator is connected to the design engineer's PC using a high-speed USB 2.0 interface and is connected to the target with either a connector compatible with in-circuit debugger systems (RJ11) or with the new high-speed, noise tolerant, Low-Voltage Differential Signal (LVDS) interconnection (CAT5).

The emulator is field upgradable through future firmware downloads in MPLAB IDE. In upcoming releases of MPLAB IDE, new devices will be supported, and new features will be added. MPLAB REAL ICE offers significant advantages over competitive emulators including low-cost, full-speed emulation, run-time variable watches, trace analysis, complex breakpoints, a ruggedized probe interface and long (up to three meters) interconnection cables.

## **26.9 MPLAB ICD 3 In-Circuit Debugger System**

MPLAB ICD 3 In-Circuit Debugger System is Microchip's most cost effective high-speed hardware debugger/programmer for Microchip Flash Digital Signal Controller (DSC) and microcontroller (MCU) devices. It debugs and programs PIC® Flash microcontrollers and dsPIC® DSCs with the powerful, yet easy-to-use graphical user interface of MPLAB Integrated Development Environment (IDE).

The MPLAB ICD 3 In-Circuit Debugger probe is connected to the design engineer's PC using a high-speed USB 2.0 interface and is connected to the target with a connector compatible with the MPLAB ICD 2 or MPLAB REAL ICE systems (RJ-11). MPLAB ICD 3 supports all MPLAB ICD 2 headers.

## **26.10 PICkit 3 In-Circuit Debugger/Programmer and PICkit 3 Debug Express**

The MPLAB PICkit 3 allows debugging and programming of PIC® and dsPIC® Flash microcontrollers at a most affordable price point using the powerful graphical user interface of the MPLAB Integrated Development Environment (IDE). The MPLAB PICkit 3 is connected to the design engineer's PC using a full speed USB interface and can be connected to the target via an Microchip debug (RJ-11) connector (compatible with MPLAB ICD 3 and MPLAB REAL ICE). The connector uses two device I/O pins and the reset line to implement in-circuit debugging and In-Circuit Serial Programming™.

The PICkit 3 Debug Express include the PICkit 3, demo board and microcontroller, hookup cables and CDROM with user's guide, lessons, tutorial, compiler and MPLAB IDE software.

### 26.11 PICkit 2 Development Programmer/Debugger and PICkit 2 Debug Express

The PICkit™ 2 Development Programmer/Debugger is a low-cost development tool with an easy to use interface for programming and debugging Microchip's Flash families of microcontrollers. The full featured Windows® programming interface supports baseline (PIC10F, PIC12F5xx, PIC16F5xx), midrange (PIC12F6xx, PIC16F), PIC18F, PIC24, dsPIC30, dsPIC33, and PIC32 families of 8-bit, 16-bit, and 32-bit microcontrollers, and many Microchip Serial EEPROM products. With Microchip's powerful MPLAB Integrated Development Environment (IDE) the PICkit™ 2 enables in-circuit debugging on most PIC® microcontrollers. In-Circuit-Debugging runs, halts and single steps the program while the PIC microcontroller is embedded in the application. When halted at a breakpoint, the file registers can be examined and modified.

The PICkit 2 Debug Express include the PICkit 2, demo board and microcontroller, hookup cables and CDROM with user's guide, lessons, tutorial, compiler and MPLAB IDE software.

### 26.12 MPLAB PM3 Device Programmer

The MPLAB PM3 Device Programmer is a universal, CE compliant device programmer with programmable voltage verification at VDDMIN and VDDMAX for maximum reliability. It features a large LCD display (128 x 64) for menus and error messages and a modular, detachable socket assembly to support various package types. The ICSP™ cable assembly is included as a standard item. In Stand-Alone mode, the MPLAB PM3 Device Programmer can read, verify and program PIC devices without a PC connection. It can also set code protection in this mode. The MPLAB PM3 connects to the host PC via an RS-232 or USB cable. The MPLAB PM3 has high-speed communications and optimized algorithms for quick programming of large memory devices and incorporates an MMC card for file storage and data applications.

### 26.13 Demonstration/Development Boards, Evaluation Kits, and Starter Kits

A wide variety of demonstration, development and evaluation boards for various PIC MCUs and dsPIC DSCs allows quick application development on fully functional systems. Most boards include prototyping areas for adding custom circuitry and provide application firmware and source code for examination and modification.

The boards support a variety of features, including LEDs, temperature sensors, switches, speakers, RS-232 interfaces, LCD displays, potentiometers and additional EEPROM memory.

The demonstration and development boards can be used in teaching environments, for prototyping custom circuits and for learning about various microcontroller applications.

In addition to the PICDEM™ and dsPICDEM™ demonstration/development board series of circuits, Microchip has a line of evaluation kits and demonstration software for analog filter design, KEELOQ® security ICs, CAN, IrDA®, PowerSmart battery management, SEEVAL® evaluation system, Sigma-Delta ADC, flow rate sensing, plus many more.

Also available are starter kits that contain everything needed to experience the specified device. This usually includes a single application and debug capability, all on one board.

Check the Microchip web page ([www.microchip.com](http://www.microchip.com)) for the complete list of demonstration, development and evaluation kits.

## 27.0 ELECTRICAL CHARACTERISTICS

This section provides an overview of dsPIC33FJ32GS406/606/608/610 and dsPIC33FJ64GS406/606/608/610 electrical characteristics. Additional information will be provided in future revisions of this document as it becomes available.

Absolute maximum ratings for the dsPIC33FJ32GS406/606/608/610 and dsPIC33FJ64GS406/606/608/610 family are listed below. Exposure to these maximum rating conditions for extended periods may affect device reliability. Functional operation of the device at these or any other conditions above the parameters indicated in the operation listings of this specification is not implied.

### Absolute Maximum Ratings<sup>(1)</sup>

|                                                                                         |                       |
|-----------------------------------------------------------------------------------------|-----------------------|
| Ambient temperature under bias .....                                                    | -40°C to +125°C       |
| Storage temperature .....                                                               | -65°C to +150°C       |
| Voltage on VDD with respect to VSS .....                                                | -0.3V to +4.0V        |
| Voltage on any pin that is not 5V tolerant with respect to VSS <sup>(3)</sup> .....     | -0.3V to (VDD + 0.3V) |
| Voltage on any 5V tolerant pin with respect to VSS when VDD ≥ 3.0V <sup>(3)</sup> ..... | -0.3V to +5.6V        |
| Voltage on any 5V tolerant pin with respect to VSS when VDD < 3.0V <sup>(3)</sup> ..... | -0.3V to (VDD + 0.3V) |
| Maximum current out of VSS pin .....                                                    | 300 mA                |
| Maximum current into VDD pin <sup>(2)</sup> .....                                       | 250 mA                |
| Maximum current sourced/sunk by any 4x I/O pin .....                                    | 15 mA                 |
| Maximum current sourced/sunk by any 8x I/O pin .....                                    | 25 mA                 |
| Maximum current sourced/sunk by any 16x I/O pin .....                                   | 45 mA                 |
| Maximum current sunk by all ports .....                                                 | 200 mA                |
| Maximum current sourced by all ports <sup>(2)</sup> .....                               | 200mA                 |

**Note 1:** Stresses above those listed under “Absolute Maximum Ratings” may cause permanent damage to the device. This is a stress rating only, and functional operation of the device at those or any other conditions above those indicated in the operation listings of this specification is not implied. Exposure to maximum rating conditions for extended periods may affect device reliability.

**2:** Maximum allowable current is a function of the device maximum power dissipation (see [Table 27-2](#)).

**3:** See the “[Pin Diagrams](#)” section for 5V tolerant pins.

## 27.1 DC Characteristics

**TABLE 27-1: OPERATING MIPS vs. VOLTAGE**

| Characteristic | VDD Range<br>(in Volts) | Temp Range<br>(in °C) | Max MIPS                                                         |
|----------------|-------------------------|-----------------------|------------------------------------------------------------------|
|                |                         |                       | dsPIC33FJ32GS406/606/608/610 and<br>dsPIC33FJ64GS406/606/608/610 |
| —              | 3.0-3.6V <sup>(1)</sup> | -40°C to +85°C        | 40                                                               |
| —              | 3.0-3.6V <sup>(1)</sup> | -40°C to +125°C       | 40                                                               |

**Note 1:** Overall functional device operation at  $V_{BORMIN} < V_{DD} < V_{DDMIN}$  is tested but not characterized. All device analog modules, such as the ADC, etc., will function but with degraded performance below  $V_{DDMIN}$ . See Parameter [BO10](#) in [Table 27-11](#) for the BOR values.

**TABLE 27-2: THERMAL OPERATING CONDITIONS**

| Rating                                                                                                                                                                                                                     | Symbol | Min                       | Typ | Max  | Unit |
|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------|---------------------------|-----|------|------|
| Industrial Temperature Devices                                                                                                                                                                                             |        |                           |     |      |      |
| Operating Junction Temperature Range                                                                                                                                                                                       | TJ     | -40                       | —   | +125 | °C   |
| Operating Ambient Temperature Range                                                                                                                                                                                        | TA     | -40                       | —   | +85  | °C   |
| Extended Temperature Devices                                                                                                                                                                                               |        |                           |     |      |      |
| Operating Junction Temperature Range                                                                                                                                                                                       | TJ     | -40                       | —   | +140 | °C   |
| Operating Ambient Temperature Range                                                                                                                                                                                        | TA     | -40                       | —   | +125 | °C   |

| DC17                     | SVDD   | <b>VDD Rise Rate<sup>(3)</sup></b><br>to Ensure Internal<br>Power-on Reset Signal | 0.03                                                                                                                                                                    | —                  | —   | V/ms  | 0-3.0V in 0.1s          |

**Note 1:** Data in “Typ” column is at 3.3V, +25°C unless otherwise stated.

**2:** This is the limit to which VDD may be lowered without losing RAM data.

**3:** These parameters are characterized but not tested in manufacturing.

**4:** Overall functional device operation at VBORMIN < VDD < VDDMIN is tested but not characterized. All device analog modules such as the ADC, etc., will function but with degraded performance below VDDMIN. See Parameter BO10 in [Table 27-11](#) for the BOR values.

**Note 1:** Data in "Typical" column is at 3.3V, +25°C unless otherwise stated.

- 2:** IDD is primarily a function of the operating voltage and frequency. Other factors, such as I/O pin loading and switching rate, oscillator type, internal code execution pattern and temperature, also have an impact on the current consumption. The test conditions for all IDD measurements are as follows:
- Oscillator is configured in EC mode with PLL, OSC1 is driven with external square wave from rail-to-rail (EC clock overshoot/undershoot < 250 mV required)
  - CLKO is configured as an I/O input pin in the Configuration Word
  - All I/O pins are configured as inputs and pulled to Vss
  - MCLR = VDD, WDT and FSCM are disabled
  - CPU, SRAM, program memory and data memory are operational
  - No peripheral modules are operating; however, every peripheral is being clocked (all PMDx bits are all '0's)
  - CPU executing `while(1)` statement
  - JTAG disabled
- 3:** These parameters are characterized but not tested in manufacturing.

**Note 1:** Data in “Typical” column is at 3.3V, +25°C unless otherwise stated.

- 2:** IDD is primarily a function of the operating voltage and frequency. Other factors, such as I/O pin loading and switching rate, oscillator type, internal code execution pattern and temperature, also have an impact on the current consumption. The test conditions for all IDD measurements are as follows:
- Oscillator is configured in EC mode with PLL, OSC1 is driven with external square wave from rail-to-rail (EC clock overshoot/undershoot < 250 mV required)
  - CLKO is configured as an I/O input pin in the Configuration Word
  - All I/O pins are configured as inputs and pulled to VSS
  - MCLR = VDD, WDT and FSCM are disabled
  - CPU, SRAM, program memory and data memory are operational
  - No peripheral modules are operating; however, every peripheral is being clocked (all PMDx bits are all ‘0’s)
  - CPU executing `while(1)` statement
  - JTAG disabled
- 3:** These parameters are characterized but not tested in manufacturing.

| DC44c                                                               | 31                     | 40  | mA                                                                                                                                                                                                                                                | +125°C     |      |                        |

**Note 1:** Data in “Typical” column is at 3.3V, +25°C unless otherwise stated.

**2:** Base Idle current (IDLE) is measured as follows:

- CPU core is off, oscillator is configured in EC mode and external clock is active, OSC1 is driven with external square wave from rail-to-rail (EC clock overshoot/undershoot < 250 mV required)
- CLKO is configured as an I/O input pin in the Configuration Word
- All I/O pins are configured as inputs and pulled to V<sub>SS</sub>
- MCLR = V<sub>DD</sub>, WDT and FSCM are disabled
- No peripheral modules are operating; however, every peripheral is being clocked (all PMDx bits are all ‘0’s)
- JTAG is disabled

**3:** These parameters are characterized but not tested in manufacturing.

**TABLE 27-7: DC CHARACTERISTICS: POWER-DOWN CURRENT (IPD)**

| DC61c                                     | 13                     | 25   | μA                                                                                                                                                                         | +125°C     |                                                                      |

**Note 1:** Data in the Typical column is at 3.3V, +25°C unless otherwise stated.

**2:** IPD (Sleep) current is measured as follows:

- CPU core is off, oscillator is configured in EC mode and external clock is active, OSC1 is driven with external square wave from rail-to-rail (EC clock overshoot/undershoot < 250 mV required)
- CLKO is configured as an I/O input pin in the Configuration Word
- All I/O pins are configured as inputs and pulled to VSS
- MCLR = VDD, WDT and FSCM are disabled
- All peripheral modules are disabled (all PMDx bits are all '1's)
- The VREGS bit (RCON<8>) = 0 (i.e., core regulator is set to standby while the device is in Sleep mode)
- JTAG disabled

**3:** The Δ current is the additional current consumed when the WDT module is enabled. This current should be added to the base IPD current.

**4:** These currents are measured on the device containing the most memory in this family.

**TABLE 27-8: DC CHARACTERISTICS: DOZE CURRENT (IDOZE)**

| DC CHARACTERISTICS                  |                        |     | Standard Operating Conditions: 3.0V to 3.6V<br>(unless otherwise stated)<br>Operating temperature    -40°C ≤ TA ≤ +85°C for Industrial<br>-40°C ≤ TA ≤ +125°C for Extended |       |            |      |         |

| DC72g                               | 36                     | 60  | 1:128                                                                                                                                                                      | mA    |            |      |         |

**Note 1:** Data in the Typical column is at 3.3V, +25°C unless otherwise stated.

**2:** IDOZE is primarily a function of the operating voltage and frequency. Other factors, such as I/O pin loading and switching rate, oscillator type, internal code execution pattern and temperature, also have an impact on the current consumption. The test conditions for all IDOZE measurements are as follows:

- Oscillator is configured in EC mode and external clock is active, OSC1 is driven with external square wave from rail-to-rail (EC clock overshoot/undershoot < 250 mV required)
- CLKO is configured as an I/O input pin in the Configuration Word
- All I/O pins are configured as inputs and pulled to VSS
- MCLR = VDD, WDT and FSCM are disabled
- CPU, SRAM, program memory and data memory are operational
- No peripheral modules are operating; however, every peripheral is being clocked (all PMDx bits are all '0's)
- CPU executing `while(1)` statement
- JTAG disabled

**Note 1:** Data in “Typ” column is at 3.3V, +25°C unless otherwise stated.

**2:** The leakage current on the  $\overline{\text{MCLR}}$  pin is strongly dependent on the applied voltage level. The specified levels represent normal operating conditions. Higher leakage current may be measured at different input voltages.

**3:** Negative current is defined as current sourced by the pin.

**4:** See “Pin Diagrams” for the list of 5V tolerant I/O pins.

**5:** V<sub>IL</sub> source < (V<sub>SS</sub> – 0.3). Characterized but not tested.

**6:** Non 5V tolerant pins V<sub>IH</sub> source > (V<sub>DD</sub> + 0.3), 5V tolerant pins V<sub>IH</sub> source > 5.5V. Characterized but not tested.

**7:** Digital 5V tolerant pins cannot tolerate any “positive” input injection current from input sources > 5.5V.

**8:** Injection currents > |0| can affect the ADC results by approximately 4-6 counts.

**9:** Any number and/or combination of I/O pins not excluded under I<sub>ICL</sub> or I<sub>ICH</sub> conditions are permitted, provided the mathematical “absolute instantaneous” sum of the input injection currents from all pins do not exceed the specified limit. Characterized but not tested.

| DI60c              | $\sum I_{ICT}$   | Total Input Injection Current<br>(sum of all I/O and control pins) | -20 <sup>(9)</sup>                                                                                                                                                                                                                                | —                  | +20 <sup>(9)</sup>    | mA    | Absolute instantaneous sum of all $\pm$ input injection currents from all I/O pins<br>( $ I_{ICL}  +  I_{ICH}  \leq \sum I_{ICT}$ )                                              |

- Note 1:** Data in “Typ” column is at 3.3V, +25°C unless otherwise stated.
- 2:** The leakage current on the MCLR pin is strongly dependent on the applied voltage level. The specified levels represent normal operating conditions. Higher leakage current may be measured at different input voltages.
- 3:** Negative current is defined as current sourced by the pin.
- 4:** See “Pin Diagrams” for the list of 5V tolerant I/O pins.
- 5:** V<sub>IL</sub> source < (V<sub>SS</sub> – 0.3). Characterized but not tested.
- 6:** Non 5V tolerant pins V<sub>IH</sub> source > (V<sub>DD</sub> + 0.3), 5V tolerant pins V<sub>IH</sub> source > 5.5V. Characterized but not tested.
- 7:** Digital 5V tolerant pins cannot tolerate any “positive” input injection current from input sources > 5.5V.
- 8:** Injection currents > |0| can affect the ADC results by approximately 4-6 counts.
- 9:** Any number and/or combination of I/O pins not excluded under I<sub>ICL</sub> or I<sub>ICH</sub> conditions are permitted, provided the mathematical “absolute instantaneous” sum of the input injection currents from all pins do not exceed the specified limit. Characterized but not tested.

**Note 1:** Parameters are for design guidance only and are not tested in manufacturing.

**2:** The device will operate as normal until the VDDMIN threshold is reached.

**3:** Overall functional device operation at VBORMIN < VDD < VDDMIN is tested but not characterized. All device analog modules, such as the ADC, etc., will function but with degraded performance below VDDMIN.

**Note 1:** Data in “Typ” column is at 3.3V, +25°C unless otherwise stated.

**2:** Other conditions: FRC = 7.37 MHz, TUN<5:0> = b'011111 (for Min.), TUN<5:0> = b'100000 (for Max.). This parameter depends on the FRC accuracy (see [Table 27-20](#)) and the value of the FRC Oscillator Tuning register (see [Register 9-4](#)). For complete details on calculating the minimum and maximum time, see [Section 5.3 “Programming Operations”](#).

**Note 1:** Data in “Typ” column is at 3.3V, +25°C unless otherwise stated.

**2:** Instruction cycle period (Tcy) equals two times the input oscillator time base period. All specified values are based on characterization data for that particular oscillator type, under standard operating conditions, with the device executing code. Exceeding these specified limits may result in an unstable oscillator operation and/or higher than expected current consumption. All devices are tested to operate at “min.” values with an external clock applied to the OSC1/CLKI pin. When an external clock input is used, the “max.” cycle time limit is “DC” (no clock) for all devices.

**3:** Measurements are taken in EC mode. The CLK0 signal is measured on the OSC2 pin.

**Note 1:** Data in “Typ” column is at 3.3V, +25°C unless otherwise stated. Parameters are for design guidance only and are not tested in manufacturing.

**2:** These parameters are characterized by similarity, but are not tested in manufacturing. This specification is based on clock cycle by clock cycle measurements. To calculate the effective jitter for individual time bases or communication clocks, use this formula:

$$\text{Peripheral Clock Jitter} = \frac{DCLK}{\sqrt{\left( \frac{FOSC}{\text{Peripheral Bit Rate Clock}} \right)}}$$

For example: FOSC = 32 MHz, DCLK = 3%, SPI bit rate clock, (i.e., SCK) is 2 MHz.

$$\text{SPI SCK Jitter} = \left[ \frac{DCLK}{\sqrt{\left( \frac{32 \text{ MHz}}{2 \text{ MHz}} \right)}} \right] = \left[ \frac{3\%}{\sqrt{16}} \right] = \left[ \frac{3\%}{4} \right] = 0.75\%$$

- Note 1:** These parameters are characterized, but are not tested in manufacturing.
- 2:** Data in “Typ” column is at 3.3V, +25°C unless otherwise stated.
- 3:** The minimum clock period for SCKx is 66.7 ns. Therefore, the clock generated in Master mode must not violate this specification.
- 4:** Assumes 50 pF load on all SPIx pins.

**Note 1:** These parameters are characterized, but are not tested in manufacturing.

**Note 2:** Data in “Typ” column is at 3.3V, +25°C unless otherwise stated.

**Note 3:** The minimum clock period for SCKx is 100 ns. The clock generated in Master mode must not violate this specification.

**Note 4:** Assumes 50 pF load on all SPIx pins.

**Note 1:** These parameters are characterized, but are not tested in manufacturing.

**2:** Data in “Typ” column is at 3.3V, +25°C unless otherwise stated.

**3:** The minimum clock period for SCKx is 66.7 ns. Therefore, the SCKx clock, generated by the master, must not violate this specification.

**4:** Assumes 50 pF load on all SPIx pins.

**FIGURE 27-18: SPIx SLAVE MODE (FULL-DUPLEX, CKE = 0, CKP = 0, SMP = 0) TIMING CHARACTERISTICS**

**Note:** Refer to [Figure 27-1](#) for load conditions.

**Note 1:** These parameters are characterized, but are not tested in manufacturing.

**2:** Data in “Typ” column is at 3.3V, +25°C unless otherwise stated.

**3:** The minimum clock period for SCKx is 91 ns. Therefore, the SCKx clock, generated by the master, must not violate this specification.

**4:** Assumes 50 pF load on all SPIx pins.

**Note 1:** BRG is the value of the I<sup>2</sup>C™ Baud Rate Generator. Refer to **Section 19. “Inter-Integrated Circuit (I<sup>2</sup>C™)”** (DS70195) in the “dsPIC33F/PIC24H Family Reference Manual”.

**2:** Maximum pin capacitance = 10 pF for all I2Cx pins (for 1 MHz mode only).

**3:** Typical value for this parameter is 130 ns.

**Note 1:** The Analog-to-Digital conversion result never decreases with an increase in the input voltage and has no missing codes.

**2:** Overall functional device operation at VBOR < VDD < VDDMIN is ensured but not characterized. All device analog modules, such as the ADC, etc., will function but with degraded performance below VDDMIN.

**Note 1:** These parameters are characterized but not tested in manufacturing.

**Note 2:** Overall functional device operation at VBOR < VDD < VDDMIN is guaranteed but not characterized. All device analog modules such as the ADC, etc., will function but with degraded performance below VDDMIN.

## 28.0 50 MIPS ELECTRICAL CHARACTERISTICS

This section provides an overview of dsPIC33FJ32GS406/606/608/610 and dsPIC33FJ64GS406/606/608/610 electrical characteristics for devices operating at 50 MIPS.

Specifications are identical to those shown in [Section 27.0 “Electrical Characteristics”](#), with the exception of the parameters listed in this section.

Absolute maximum ratings for the dsPIC33FJ32GS406/606/608/610 and dsPIC33FJ64GS406/606/608/610 50 MIPS devices are listed below. Exposure to these maximum rating conditions for extended periods can affect device reliability. Functional operation of the device at these or any other conditions above the parameters indicated in the operation listings of this specification is not implied.

### Absolute Maximum Ratings<sup>(1)</sup>

|                                                                                          |                       |
|------------------------------------------------------------------------------------------|-----------------------|
| Ambient temperature under bias .....                                                     | -40°C to +85°C        |
| Storage temperature .....                                                                | -65°C to +150°C       |
| Voltage on VDD with respect to VSS .....                                                 | -0.3V to +4.0V        |
| Voltage on any pin that is not 5V tolerant, with respect to VSS <sup>(2)</sup> .....     | -0.3V to (VDD + 0.3V) |
| Voltage on any 5V tolerant pin with respect to VSS, when VDD ≥ 3.0V <sup>(2)</sup> ..... | -0.3V to +5.6V        |
| Voltage on any 5V tolerant pin with respect to VSS, when VDD < 3.0V <sup>(2)</sup> ..... | -0.3V to (VDD + 0.3V) |
| Maximum current out of VSS pin .....                                                     | 300 mA                |
| Maximum current into VDD pin <sup>(2)</sup> .....                                        | 250 mA                |
| Maximum current sourced/sunk by any 4x I/O pin .....                                     | 15 mA                 |
| Maximum current sourced/sunk by any 8x I/O pin .....                                     | 25 mA                 |
| Maximum current sourced/sunk by any 16x I/O pin .....                                    | 45 mA                 |
| Maximum current sunk by all ports .....                                                  | 200 mA                |
| Maximum current sourced by all ports <sup>(2)</sup> .....                                | 200mA                 |

**Note 1:** Stresses above those listed under “Absolute Maximum Ratings” may cause permanent damage to the device. This is a stress rating only, and functional operation of the device at those or any other conditions above those indicated in the operation listings of this specification is not implied. Exposure to maximum rating conditions for extended periods may affect device reliability.

**2:** See the “[Pin Diagrams](#)” section for 5V tolerant pins.

## 28.1 DC Characteristics

**TABLE 28-1: OPERATING MIPS vs. VOLTAGE**

| Characteristic | VDD Range<br>(in Volts) | Temp Range<br>(in °C) | Max MIPS                                                         |
|----------------|-------------------------|-----------------------|------------------------------------------------------------------|
|                |                         |                       | dsPIC33FJ32GS406/606/608/610 and<br>dsPIC33FJ64GS406/606/608/610 |
| —              | 3.0-3.6V <sup>(1)</sup> | -40°C to +85°C        | 50                                                               |

**Note 1:** Overall functional device operation at  $V_{BORMIN} < V_{DD} < V_{DDMIN}$  is tested but not characterized. All device analog modules, such as the ADC, etc., will function but with degraded performance below  $V_{DDMIN}$ . See Parameter [BO10](#) in [Table 27-11](#) for the BOR values.

**TABLE 28-2: DC CHARACTERISTICS: OPERATING CURRENT (IDD)**

| DC CHARACTERISTICS                     |         |     | Standard Operating Conditions: 3.0V to 3.6V (unless otherwise stated)<br>Operating temperature    -40°C ≤ TA ≤ +85°C for Industrial |            |      |
|----------------------------------------|---------|-----|-------------------------------------------------------------------------------------------------------------------------------------|------------|------|
| Parameter No.                          | Typical | Max | Units                                                                                                                               | Conditions |      |
| Operating Current (IDD) <sup>(1)</sup> |         |     |                                                                                                                                     |            |      |
| MDC29d                                 | 85      | 100 | mA                                                                                                                                  | -40°C      | 3.3V |

**Note 1:**  $I_{DD}$  is primarily a function of the operating voltage and frequency. Other factors, such as I/O pin loading and switching rate, oscillator type, internal code execution pattern and temperature, also have an impact on the current consumption. The test conditions for all  $I_{DD}$  measurements are as follows:

- Oscillator is configured in EC mode with PLL, OSC1 is driven with external square wave from rail-to-rail (EC clock overshoot/undershoot < 250 mV required)
- CLKO is configured as an I/O input pin in the Configuration Word
- All I/O pins are configured as inputs and pulled to Vss
- $\overline{\text{MCLR}} = V_{DD}$ , WDT and FSCM are disabled
- CPU, SRAM, program memory and data memory are operational
- No peripheral modules are operating; however, every peripheral is being clocked (all PMDx bits are zeroed)
- CPU executing `while(1)` statement
- JTAG is disabled

**TABLE 28-3: DC CHARACTERISTICS: IDLE CURRENT (I<sub>IDLE</sub>)**

| DC CHARACTERISTICS                                                 |         |     | Standard Operating Conditions: 3.0V to 3.6V<br>(unless otherwise stated)<br>Operating temperature $-40^{\circ}\text{C} \leq T_A \leq +85^{\circ}\text{C}$ for Industrial |            |      |         |
|--------------------------------------------------------------------|---------|-----|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------|------|---------|
| Parameter No.                                                      | Typical | Max | Units                                                                                                                                                                    | Conditions |      |         |
| Idle Current (IDLE): Core Off Clock On Base Current <sup>(1)</sup> |         |     |                                                                                                                                                                          |            |      |         |
| MDC45d                                                             | 40      | 50  | mA                                                                                                                                                                       | -40°C      | 3.3V | 50 MIPS |
| MDC45a                                                             | 40      | 50  | mA                                                                                                                                                                       | +25°C      |      |         |
| MDC45b                                                             | 40      | 50  | mA                                                                                                                                                                       | +85°C      |      |         |

**Note 1:** Base Idle current (I<sub>IDLE</sub>) is measured as follows:

- CPU core is off, oscillator is configured in EC mode and external clock is active, OSC1 is driven with external square wave from rail-to-rail (EC clock overshoot/undershoot < 250 mV required)
- CLKO is configured as an I/O input pin in the Configuration Word
- All I/O pins are configured as inputs and pulled to V<sub>SS</sub>
- MCLR = V<sub>DD</sub>, WDT and FSCM are disabled
- No peripheral modules are operating; however, every peripheral is being clocked (all PMDx bits are '0's)
- JTAG is disabled

**TABLE 28-4: DC CHARACTERISTICS: DOZE CURRENT (IDOZE)**

| DC CHARACTERISTICS                               |         |     | Standard Operating Conditions: 3.0V to 3.6V<br>(unless otherwise stated)<br>Operating temperature    -40°C ≤ TA ≤ +85°C for Industrial |       |            |      |         |
|--------------------------------------------------|---------|-----|----------------------------------------------------------------------------------------------------------------------------------------|-------|------------|------|---------|
| Parameter No.                                    | Typical | Max | Doze<br>Ratio                                                                                                                          | Units | Conditions |      |         |
| Doze Current (I <sub>DOZE</sub> ) <sup>(1)</sup> |         |     |                                                                                                                                        |       |            |      |         |
| MDC74a                                           | 49      | 70  | 1:2                                                                                                                                    | mA    | -40°C      | 3.3V | 50 MIPS |
| MDC74f                                           | 43      | 70  | 1:64                                                                                                                                   | mA    |            |      |         |
| MDC74g                                           | 43      | 70  | 1:128                                                                                                                                  | mA    |            |      |         |
| MDC75a                                           | 47      | 70  | 1:2                                                                                                                                    | mA    | +25°C      | 3.3V | 50 MIPS |
| MDC75f                                           | 41      | 70  | 1:64                                                                                                                                   | mA    |            |      |         |
| MDC75g                                           | 41      | 70  | 1:128                                                                                                                                  | mA    |            |      |         |
| MDC76a                                           | 46      | 70  | 1:2                                                                                                                                    | mA    | +85°C      | 3.3V | 50 MIPS |
| MDC76f                                           | 40      | 70  | 1:64                                                                                                                                   | mA    |            |      |         |
| MDC76g                                           | 40      | 70  | 1:128                                                                                                                                  | mA    |            |      |         |

**Note 1:** IDOZE is primarily a function of the operating voltage and frequency. Other factors, such as I/O pin loading and switching rate, oscillator type, internal code execution pattern and temperature, also have an impact on the current consumption. The test conditions for all IDOZE measurements are as follows:

- Oscillator is configured in EC mode and external clock is active, OSC1 is driven with external square wave from rail-to-rail (EC clock overshoot/undershoot < 250 mV required)
- CLKO is configured as an I/O input pin in the Configuration Word
- All I/O pins are configured as inputs and pulled to Vss
- MCLR = VDD, WDT and FSCM are disabled
- CPU, SRAM, program memory and data memory are operational
- No peripheral modules are operating; however, every peripheral is being clocked (all PMDx bits are '0's)
- CPU executing `while(1)` statement
- JTAG is disabled

## 28.2 AC Characteristics and Timing Parameters

This section defines the dsPIC33FJ32GS406/606/608/610 and dsPIC33FJ64GS406/606/608/610 AC characteristics and timing parameters for 50 MIPS devices.

**TABLE 28-5: EXTERNAL CLOCK TIMING REQUIREMENTS**

| AC CHARACTERISTICS |               |                                                                                    | Standard Operating Conditions: 3.0V to 3.6V<br>(unless otherwise stated)<br>Operating temperature $-40^{\circ}\text{C} \leq T_A \leq +85^{\circ}\text{C}$ for Industrial |                    |                               |                   |                                                                |

**Note 1:** Data in “Typ” column is at 3.3V, +25°C unless otherwise stated.

**2:** Instruction cycle period (Tcy) equals two times the input oscillator time base period. All specified values are based on characterization data for that particular oscillator type under standard operating conditions with the device executing code. Exceeding these specified limits may result in an unstable oscillator operation and/or higher than expected current consumption. All devices are tested to operate at “min.” values with an external clock applied to the OSC1/CLKI pin. When an external clock input is used, the “max.” cycle time limit is “DC” (no clock) for all devices.

**3:** Measurements are taken in EC mode. The CLKO signal is measured on the OSC2 pin.

NOTES:

## **APPENDIX A: MIGRATING FROM dsPIC33FJ06GS101/X02 AND dsPIC33FJ16GSX02/X04 TO dsPIC33FJ32GS406/606/608/610 AND dsPIC33FJ64GS406/606/608/610 DEVICES**

This appendix provides an overview of considerations for migrating from the dsPIC33FJ06GS101/X02 and dsPIC33FJ16GSX02/X04 family of devices to the dsPIC33FJ32GS406/606/608/610 and dsPIC33FJ64GS406/606/608/610 family of devices. The code developed for the dsPIC33FJ06GS101/X02 and dsPIC33FJ16GSX02/X04 devices can be ported to the dsPIC33FJ32GS406/606/608/610 and dsPIC33FJ64GS406/606/608/610 devices after making the appropriate changes outlined below.

### **A.1 Device Pins and Peripheral Pin Select (PPS)**

On dsPIC33FJ06GS101/X02 and dsPIC33FJ16GSX02/X04 devices, some peripherals such as the Timer, Input Capture, Output Compare, UART, SPI, External Interrupts, Analog Comparator Output, as well as the PWM4 pin pair, were mapped to physical pins via Peripheral Pin Select (PPS) functionality. On dsPIC33FJ32GS406/606/608/610 and dsPIC33FJ64GS406/606/608/610 devices, these peripherals are hard-coded to dedicated pins. Because of this, as well as pinout differences between the two devices families, software must be updated to utilize peripherals on the desired pin locations.

### **A.2 High-Speed PWM**

#### **A.2.1 FAULT AND CURRENT-LIMIT CONTROL SIGNAL SOURCE SELECTION**

Fault and Current-Limit Control Signal Source selection has changed between the two families of devices. On dsPIC33FJ06GS101/X02 and dsPIC33FJ16GSX02/X04 devices, Fault1 through Fault8 were assigned to Fault and Current-Limit Controls with the following values:

- 00000 = Fault 1
- 00001 = Fault 2
- 00010 = Fault 3
- 00011 = Fault 4
- 00100 = Fault 5
- 00101 = Fault 6
- 00110 = Fault 7
- 00111 = Fault 8

On dsPIC33FJ32GS406/606/608/610 and dsPIC33FJ64GS406/606/608/610 devices, Fault1 through Fault8 were assigned to Fault and Current-Limit Controls with the following values:

- 01000 = Fault 1
- 01001 = Fault 2
- 01010 = Fault 3
- 01011 = Fault 4
- 01100 = Fault 5
- 01101 = Fault 6
- 01110 = Fault 7
- 01111 = Fault 8

#### **A.2.2 ANALOG COMPARATORS CONNECTION**

Connection of analog comparators to the PWM Fault and Current-Limit Control Signal Sources on dsPIC33FJ06GS101/X02 and dsPIC33FJ16GSX02/X04 devices is performed by assigning a comparator to one of the Fault sources via the virtual PPS pins, and then selecting the desired Fault as the source for Fault and Current-Limit Control. On dsPIC33FJ32GS406/606/608/610 and dsPIC33FJ64GS406/606/608/610 devices, analog comparators have a direct connection to Fault and Current-Limit Control, and can be selected with the following values for the CLSRC or FLTSRC bits:

- 00000 = Analog Comparator 1
- 00001 = Analog Comparator 2
- 00010 = Analog Comparator 3
- 00011 = Analog Comparator 4

#### **A.2.3 LEADING-EDGE BLANKING (LEB)**

The Leading-Edge Blanking Delay (LEB) bits have been moved from the LEBCOx register on dsPIC33FJ06GS101/X02 and dsPIC33FJ16GSX02/X04 devices to the LEBDLYx register on dsPIC33FJ32GS406/606/608/610 and dsPIC33FJ64GS406/606/608/610 devices.

**APPENDIX B: REVISION HISTORY****Revision B (November 2009)****Revision A (March 2009)**

This is the initial release of this document.

The revision includes the following global update:

- Added Note 2 to the shaded table that appears at the beginning of each chapter. This new note provides information regarding the availability of registers and their associated bits

This revision also includes minor typographical and formatting changes throughout the data sheet text.

All other major changes are referenced by their respective section in [Table B-1](#).

**TABLE B-1: MAJOR SECTION UPDATES**

| Section Name                                                 | Update Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|--------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>“High-Performance, 16-bit Digital Signal Controllers”</b> | <p>Added “DMA Channels” column and updated the RAM size to 9K for the dsPIC33FJ64GS406 devices in the controller families table (see Table 1).</p> <p>Updated the pin diagrams as follows:</p> <ul style="list-style-type: none"><li>• 64-pin TQFP and QFN<ul style="list-style-type: none"><li>- Removed FLT8 from pin 51</li><li>- Added FLT8 to pin 60</li><li>- Added FLT17 to pin 31</li><li>- Added FLT18 to pin32</li></ul></li><li>• 80-pin TQFP<ul style="list-style-type: none"><li>- Removed FLT8 from pin 63</li><li>- Added FLT8 to pin 76</li><li>- Added FLT19 to pin 53</li><li>- Added FLT20 to pin 52</li></ul></li><li>• 100-pin TQFP<ul style="list-style-type: none"><li>- Removed FLT8 from pin 78</li><li>- Added FLT8 to pin 93</li><li>- Added SYNCO1 to pin 95</li></ul></li></ul>                                                                                                                                        |
| <b>Section 4.0 “Memory Organization”</b>                     | <p>Added Data Memory Map for Devices with 8 KB RAM (see Figure 4-4).</p> <p>Removed SFRs IPC25 and IPC26 from the Interrupt Controller Register Map for dsPIC33FJ32GS406 and dsPIC33FJ64GS406 devices (see Table 4-7).</p> <p>The following bits in the Interrupt Controller Register Map for dsPIC33FJ32GS406 and dsPIC33FJ64GS406 devices were changed to unimplemented (see Table 4-7):</p> <ul style="list-style-type: none"><li>• Bit 2 of IFS1</li><li>• Bits 9-7 of IFS6</li><li>• Bit 2 of IEC1</li><li>• Bits 9-7 of IEC6</li><li>• Bits 10-8 of IPC4</li></ul> <p>Removed OSCTUN2 and LFSR, updated OSCCON and OSCTUN, renamed bit 13 of the REFOCON SFR in the System Control Register Map from ROSIDL to ROSSLP and changed the All Resets value from ‘0000’ to ‘2300’ for the ACLKCON SFR (see Table 4-56).</p> <p>Updated bit 1 of the PMD Register Map for dsPIC33FJ64GS608 devices from unimplemented to C1MD (see Table 4-60).</p> |

**TABLE B-1: MAJOR SECTION UPDATES (CONTINUED)**

| Section Name                                                              | Update Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|---------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Section 9.0 “Oscillator Configuration”</b>                             | <p>Removed Section 9.2 “FRC Tuning”.</p> <p>Removed the PRCDEN, TSEQEN, and LPOSCEN bits from the Oscillator Control Register (see Register 9-1).</p> <p>Updated the Oscillator Tuning Register (see Register 9-4).</p> <p>Removed the Oscillator Tuning Register 2 and the Linear Feedback Shift Register.</p> <p>Updated the default Reset values from R/W-0 to R/W-1 for the SELACLK and APSTSCLR&lt;2:0&gt; bits in the ACLKCON register (see Register 9-5).</p> <p>Renamed the ROSIDL bit to ROSSLP in the REFOCON register (see Register 9-6).</p>                                                                                                                                                                                                                                                                                                                  |
| <b>Section 10.0 “Power-Saving Features”</b>                               | <p>Updated the last paragraph of <b>Section 10.2.2 “Idle Mode”</b> to clarify when instruction execution begins.</p> <p>Added Note 1 to the PMD1 register (see Register 10-1).</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Section 11.0 “I/O Ports”</b>                                           | <p>Changed the reference to digital-only pins to 5V tolerant pins in the second paragraph of <b>Section 11.2 “Open-Drain Configuration”</b>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Section 16.0 “High-Speed PWM”</b>                                      | <p>Updated the High-Speed PWM Module Register Interconnect Diagram (see Figure 16-2).</p> <p>Updated the SYNCSRC&lt;2:0&gt; = 111, 101, and 100 definitions to Reserved in the PTCN and STCN registers (see Register 16-1 and Register 16-5).</p> <p>Updated the PWM time base maximum value from 0xFFFFB to 0xFFFF8 in the PTPER register (Register 16-3).</p> <p>Updated the smallest pulse width value from 0x0008 to 0x0009 in Note 1 of the shaded note that follows the MDC register (see Register 16-10).</p> <p>Updated the smallest pulse width value from 0x0008 to 0x0009 in Note 2 of the shaded note that follows the PDCx and SDCx registers (see Register 16-12 and Register 16-13).</p> <p>Added Note 2 and updated the FLTDAT&lt;1:0&gt; and CLDAT&lt;1:0&gt; bits, changing the word ‘data’ to ‘state’ in the IOCONx register (see Register 16-19).</p> |
| <b>Section 20.0 “Universal Asynchronous Receiver Transmitter (UART)”</b>  | <p>Updated the two baud rate range features to: 10 Mbps to 38 bps at 40 MIPS.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Section 22.0 “High-Speed 10-bit Analog-to-Digital Converter (ADC)”</b> | <p>Updated the TRGSRCx&lt;4:0&gt; = 01101 definition from Reserved to PWM secondary special event trigger selected, and updated Note 1 in the ADCP0-ADCP6 registers (see Register 22-6 through Register 22-12).</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Section 24.0 “Special Features”</b>                                    | <p>Updated the second paragraph and removed the fourth paragraph in <b>Section 24.1 “Configuration Bits”</b>.</p> <p>Updated the Device Configuration Register Map (see Table 24-1).</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

**TABLE B-1: MAJOR SECTION UPDATES (CONTINUED)**

| Section Name                                     | Update Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|--------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Section 27.0 “Electrical Characteristics”</b> | <p>Updated the Absolute Maximum Ratings for high temperature and added Note 4.</p> <p>Updated all Operating Current (IDD) Typical and Max values in Table 27-5.</p> <p>Updated all Idle Current (IDLE) Typical and Max values in Table 27-6.</p> <p>Updated all Power-Down Current (IPD) Typical and Max values in Table 27-7.</p> <p>Updated all Doze Current (IDOZE) Typical and Max values in Table 27-8.</p> <p>Updated the Typ and Max values for parameter D150 and removed parameters DI26, DI28, and DI29 from the I/O Pin Input Specifications (see Table 27-9).</p> <p>Updated the Typ and Max values for parameter DO10 and DO27 and the Min and Typ values for parameter DO20 in the I/O Pin Output Specifications (see Table 27-10).</p> <p>Added parameter numbers to the Auxiliary PLL Clock Timing Specifications (see Table 27-18).</p> <p>Added parameters numbers and updated the Internal RC Accuracy Min, Typ, and Max values (see Table 27-19 and Table 27-20).</p> <p>Added parameter numbers, Note 2, updated the Min and Typ parameter values for MP31 and MP32, and removed the conditions for MP10 and MP11 in the High-Speed PWM Module Timing Requirements (see Table 27-29).</p> <p>Updated the SPIx Module Slave Mode (CKE = 1) Timing Characteristics (see Figure 27-14).</p> <p>Added parameter IM51 to the I2Cx Bus Data Timing Requirements (Master Mode) (see Table 27-34).</p> <p>Updated the Max value for parameter AD33 in the 10-bit High-Speed ADC Module Specifications (see Table 27-36).</p> <p>Updated the titles and added parameter numbers to the Comparator and DAC Module Specifications (see Table 27-38 and Table 27-39) and the DAC Output Buffer Specifications (see Table 27-40).</p> |

**Revision C (February 2010)**

This revision includes minor typographical and formatting changes throughout the data sheet text.

All other changes are referenced by their respective section in [Table B-2](#).

**TABLE B-2: MAJOR SECTION UPDATES**

| Section Name                                     | Update Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|--------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Section 16.0 “High-Speed PWM”</b>             | Added Note 2 to PTPER (Register 16-3).<br>Added Note 1 to SEVTCMP (Register 16-4).<br>Updated Note 1 in MDC (Register 16-10).<br>Updated Note 5 and added Note 6 to PWMCONx (Register 16-11).<br>Updated Note 1 in PDCx (Register 16-12).<br>Updated Note 1 in SDCx (Register 16-13).<br>Updated Note 1 and Note 2 in PHASEx (Register 16-14).<br>Updated Note 2 in SPHASEx (Register 16-15).<br>Updated Note 1 in FCLCONx (Register 16-21).<br>Added Note 1 to STRIGx (Register 16-22).<br>Updated Leading-Edge Blanking Delay increment value from 8.4 ns to 8.32 ns and added a shaded note in LEBDLYx (Register 16-24).<br>Added Note 3 and Note 4 to PWMCAPx (Register 16-26). |
| <b>Section 27.0 “Electrical Characteristics”</b> | Updated the Min and Typ values for the Internal Voltage Regulator specifications in Table 27-13.<br>Updated the Min and Max values for the Internal RC Accuracy specifications in Table 27-20.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

# dsPIC33FJ32GS406/606/608/610 and dsPIC33FJ64GS406/606/608/610

## Revision D (January 2012)

This revision includes minor typographical and formatting changes throughout the data sheet text.

All occurrences of PGCn and PGDn (where n = 1, 2, or 3) were updated to: PGECn and PGEDn throughout the document.

All other changes are referenced by their respective section in [Table B-3](#).

**TABLE B-3: MAJOR SECTION UPDATES**

| Section Name                                                                               | Update Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| <b>Section 23.0 “High-Speed Analog Comparator”</b> | Added Note 1 to the High-Speed Analog Comparator Module block diagram (see <a href="#">Figure 23-1</a> ).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Section 24.0 “Special Features”</b>             | <p>Updated <b>Section 24.1 “Configuration Bits”</b>.</p> <p>Added the RTSP Effect column to the dsPIC33F Configuration Bits Description (see <a href="#">Table 24-2</a>).</p> <p>Added Note 3 to the Connections for the On-chip Voltage Regulator (see <a href="#">Figure 24-1</a>).</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Section 27.0 “Electrical Characteristics”</b>   | <p>Updated the Absolute Maximum Ratings.</p> <p>Updated the Operating MIPS vs. Voltage and added Note 1 (see <a href="#">Table 27-1</a>).</p> <p>Updated Note 4 and removed parameter DC18 from the DC Temperature and Voltage Specifications (see <a href="#">Table 27-4</a>).</p> <p>Updated Note 2, Typical and Maximum values for parameters DC20-DC24, and the Conditions for parameters DC25-DC28 in the Operating Current DC Characteristics (see <a href="#">Table 27-5</a>).</p> <p>Updated Note 2 in the Idle Current DC Characteristics (see <a href="#">Table 27-6</a>).</p> <p>Updated Note 2 in the Power-down Current DC Characteristics (see <a href="#">Table 27-7</a>).</p> <p>Added Note 2 to the Doze Current DC Characteristics (see <a href="#">Table 27-8</a>).</p> <p>Added parameters DI60a, DI60b, and DI60c to the I/O Pin Input Specifications (see <a href="#">Table 27-9</a>).</p> <p>Updated all I/O Pin Output Specifications (see <a href="#">Table 27-10</a>).</p> <p>Updated parameter BO10 and added Note 2 and Note 3 to the BOR Electrical Characteristics (see <a href="#">Table 27-11</a>).</p> <p>Added Note 1 to the Internal Voltage Regulator Specifications (see <a href="#">Table 27-13</a>).</p> <p>Updated the OS25 parameter in the External Clock Timing diagram (see <a href="#">Figure 27-2</a>).</p> <p>Added the Secondary Oscillator (SOSC) to parameter OS10, added parameter OS42 (GM), and added Note 2 to the External Clock Timing Requirements (see <a href="#">Table 27-16</a>).</p> <p>Updated Note 2 in the Internal FRC Accuracy AC Characteristics (see <a href="#">Table 27-19</a>).</p> <p>Updated parameters DO31 and DO32 in the I/O Timing Requirements (see <a href="#">Table 27-21</a>).</p> |

**TABLE B-3: MAJOR SECTION UPDATES (CONTINUED)**

| Section Name                                                  | Update Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|---------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Section 27.0 “Electrical Characteristics” (Continued)</b>  | Updated the Timer1, Timer2, and Timer3 External Clock Timing Requirements (see <a href="#">Table 27-23</a> , <a href="#">Table 27-24</a> , and <a href="#">Table 27-25</a> ).<br><br>Updated the Simple OC/PWM Mode Timing Requirements (see <a href="#">Table 27-28</a> ).<br><br>Updated all SPI Timing specifications (see <a href="#">Figure 27-11-Figure 27-18</a> and <a href="#">Table 27-30-Table 27-37</a> ).<br><br>Added Note 2 to the 10-bit High-Speed ADC Module Specifications (see <a href="#">Table 27-40</a> ).<br><br>Added Note 2 to the 10-bit High-Speed ADC Module Timing Requirements (see <a href="#">Table 27-41</a> ).<br><br>Added parameter DA08 to the DAC Module Specifications (see <a href="#">Table 27-43</a> ).<br><br>Updated parameter DA16 in the DAC Output Buffer Specifications (see <a href="#">Table 27-44</a> ).<br><br>Added DMA Read/Write Timing Requirements (see <a href="#">Table 27-49</a> ). |
| <b>Section 28.0 “50 MIPS Electrical Characteristics”</b>      | Added new chapter with electrical specifications for 50 MIPS devices.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Section 29.0 “DC and AC Device Characteristics Graphs”</b> | Added new chapter.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

**Revision E (October 2012)**

This revision removes the Preliminary watermark and includes minor typographical and formatting changes throughout the data sheet.

## INDEX

### A

|                                               |     |
|-----------------------------------------------|-----|
| AC Characteristics .....                      | 378 |
| 10-Bit, High-Speed ADC .....                  | 406 |
| Internal FRC Accuracy .....                   | 381 |
| Internal LPRC Accuracy .....                  | 381 |
| Load Conditions .....                         | 378 |
| Temperature and Voltage Specifications .....  | 378 |
| Alternate Interrupt Vector Table (AIVT) ..... | 123 |
| Arithmetic Logic Unit (ALU) .....             | 39  |
| Assembler .....                               |     |
| MPASM Assembler .....                         | 362 |

### B

|                                                                                 |               |

## THE MICROCHIP WEB SITE

Microchip provides online support via our WWW site at [www.microchip.com](http://www.microchip.com). This web site is used as a means to make files and information easily available to customers. Accessible by using your favorite Internet browser, the web site contains the following information:

- **Product Support** – Data sheets and errata, application notes and sample programs, design resources, user's guides and hardware support documents, latest software releases and archived software
- **General Technical Support** – Frequently Asked Questions (FAQs), technical support requests, online discussion groups, Microchip consultant program member listing
- **Business of Microchip** – Product selector and ordering guides, latest Microchip press releases, listing of seminars and events, listings of Microchip sales offices, distributors and factory representatives

## CUSTOMER CHANGE NOTIFICATION SERVICE

Microchip's customer notification service helps keep customers current on Microchip products. Subscribers will receive e-mail notification whenever there are changes, updates, revisions or errata related to a specified product family or development tool of interest.

To register, access the Microchip web site at [www.microchip.com](http://www.microchip.com). Under "Support", click on "Customer Change Notification" and follow the registration instructions.

## CUSTOMER SUPPORT

Users of Microchip products can receive assistance through several channels:

- Distributor or Representative
- Local Sales Office
- Field Application Engineer (FAE)
- Technical Support
- Development Systems Information Line

Customers should contact their distributor, representative or field application engineer (FAE) for support. Local sales offices are also available to help customers. A listing of sales offices and locations is included in the back of this document.

**Technical support is available through the web site at: <http://microchip.com/support>**

## READER RESPONSE

It is our intention to provide you with the best documentation possible to ensure successful use of your Microchip product. If you wish to provide your comments on organization, clarity, subject matter, and ways in which our documentation can better serve you, please FAX your comments to the Technical Publications Manager at (480) 792-4150.

Please list the following information, and use this outline to provide us with your comments about this document.

Questions:

1. What are the best features of this document?

---

---

2. How does this document meet your hardware and software development needs?

---

---

3. Do you find the organization of this document easy to follow? If not, why?

---

---

4. What additions to the document do you think would enhance the structure and subject?

---

---

5. What deletions from the document could be made without affecting the overall usefulness?

---

---

6. Is there any incorrect or misleading information (what and where)?

---

---

7. How would you improve this document?

---

---

## PRODUCT IDENTIFICATION SYSTEM

To order or obtain information, e.g., on pricing or delivery, refer to the factory or the listed sales office.

NOTES:

---

**Note the following details of the code protection feature on Microchip devices:**

- Microchip products meet the specification contained in their particular Microchip Data Sheet.
- Microchip believes that its family of products is one of the most secure families of its kind on the market today, when used in the intended manner and under normal conditions.
- There are dishonest and possibly illegal methods used to breach the code protection feature. All of these methods, to our knowledge, require using the Microchip products in a manner outside the operating specifications contained in Microchip's Data Sheets. Most likely, the person doing so is engaged in theft of intellectual property.
- Microchip is willing to work with the customer who is concerned about the integrity of their code.
- Neither Microchip nor any other semiconductor manufacturer can guarantee the security of their code. Code protection does not mean that we are guaranteeing the product as "unbreakable."

Code protection is constantly evolving. We at Microchip are committed to continuously improving the code protection features of our products. Attempts to break Microchip's code protection feature may be a violation of the Digital Millennium Copyright Act. If such acts allow unauthorized access to your software or other copyrighted work, you may have a right to sue for relief under that Act.

**QUALITY MANAGEMENT SYSTEM**  
**CERTIFIED BY DNV**  
**== ISO/TS 16949 ==**

*Microchip received ISO/TS-16949:2009 certification for its worldwide headquarters, design and wafer fabrication facilities in Chandler and Tempe, Arizona; Gresham, Oregon and design centers in California and India. The Company's quality system processes and procedures are for its PIC® MCUs and dsPIC® DSCs, KEELOQ® code hopping devices, Serial EEPROMs, microperipherals, nonvolatile memory and analog products. In addition, Microchip's quality system for the design and manufacture of development systems is ISO 9001:2000 certified.*

Компания «Life Electronics» занимается поставками электронных компонентов импортного и отечественного производства от производителей и со складов крупных дистрибьюторов Европы, Америки и Азии.

С конца 2013 года компания активно расширяет линейку поставок компонентов по направлению коаксиальный кабель, кварцевые генераторы и конденсаторы (керамические, пленочные, электролитические), за счёт заключения дистрибьюторских договоров

Мы предлагаем:

- Конкурентоспособные цены и скидки постоянным клиентам.
- Специальные условия для постоянных клиентов.
- Подбор аналогов.
- Поставку компонентов в любых объемах, удовлетворяющих вашим потребностям.
- Приемлемые сроки поставки, возможна ускоренная поставка.
- Доставку товара в любую точку России и стран СНГ.
- Комплексную поставку.
- Работу по проектам и поставку образцов.
- Формирование склада под заказчика.
- Сертификаты соответствия на поставляемую продукцию (по желанию клиента).
- Тестирование поставляемой продукции.
- Поставку компонентов, требующих военную и космическую приемку.
- Входной контроль качества.
- Наличие сертификата ISO.

В составе нашей компании организован Конструкторский отдел, призванный помогать разработчикам, и инженерам.

Конструкторский отдел помогает осуществить:

- Регистрацию проекта у производителя компонентов.
- Техническую поддержку проекта.
- Защиту от снятия компонента с производства.
- Оценку стоимости проекта по компонентам.
- Изготовление тестовой платы монтаж и пусконаладочные работы.
