

FEATURES

- Constant low $R_{DS(on)}$ of 40 m Ω over input voltage range
- Low input voltage range: 0.9 V to 3.6 V
- 500 mA continuous operating current at 85°C
- 1.2 V logic compatible enable input
- Low 6 μ A quiescent current, independent of load current
- Ultralow shutdown current: <100 nA
- Ultrasmall 0.8 mm \times 0.8 mm \times 0.5 mm, 4-ball, 0.4 mm pitch WLCSP

APPLICATIONS

- Low operating voltage processors
- Mobile phones
- Digital cameras and audio devices
- Portable and battery-powered equipment
- Optical XMT/RCVR modules

GENERAL DESCRIPTION

The ADP199 is a high-side load switch designed for operation between 0.9 V to 3.6 V. A load switch provides power domain isolation, thereby helping to keep subsystems isolated and powered independently, and enabling reduced power consumption.

The ADP199 contains a low on-resistance, N-channel MOSFET to minimize power loss, and supports over 500 mA of continuous load current. The low 6 μ A quiescent current and ultralow shutdown current make the ADP199 ideal for battery-operated portable equipment. The built-in level shifter for enable logic makes the ADP199 compatible with many processors and GPIO controllers.

In addition to high performance, the ADP199 occupies minimal printed circuit board (PCB) space with an area of less than 0.64 mm² and a height of 0.50 mm.

The ADP199 is available in an ultra-small, 0.8 mm \times 0.8 mm \times 0.5 mm, 4-ball, 0.4 mm pitch WLCSP.

ABSOLUTE MAXIMUM RATINGS

Table 2.

Parameter	Rating
VIN to GND	-0.3 V to +4.0 V
VOU to GND	-0.3 V to V_{IN}
EN to GND	-0.3 V to +4.0 V
Continuous Drain Current	
$T_A = 25^\circ\text{C}$	± 1000 mA
$T_A = 85^\circ\text{C}$	± 700 mA
Continuous Diode Current	-50 mA
Storage Temperature Range	-65°C to +150°C
Operating Junction Temperature Range	-40°C to +85°C
Soldering Conditions	JEDEC J-STD-020

Stresses above those listed under Absolute Maximum Ratings may cause permanent damage to the device. This is a stress rating only; functional operation of the device at these or any other conditions above those indicated in the operational section of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

ESD CAUTION

ESD (electrostatic discharge) sensitive device. Charged devices and circuit boards can discharge without detection. Although this product features patented or proprietary protection circuitry, damage may occur on devices subjected to high energy ESD. Therefore, proper ESD precautions should be taken to avoid performance degradation or loss of functionality.

PIN CONFIGURATION AND FUNCTION DESCRIPTIONS

THEORY OF OPERATION

The **ADP199** is a high-side NMOS load switch controlled by an internal charge pump. The **ADP199** is designed to operate with power supply voltages between 0.9 V and 3.6 V.

An internal charge pump biases the NMOS switch to achieve a relatively constant, ultralow on resistance of 40 m Ω across the entire input voltage range. The use of the internal charge pump also allows for controlled turn-on times. The switch is controlled on/off by the enable (EN) input and is capable of interfacing directly with 1.2 V logic signals.

The **ADP199** is capable of 500 mA of continuous load current as long as T_j is less than 85°C.

ESD protection structures are shown in the block diagram (see Figure 29) as Zener diodes.

The **ADP199** is a low quiescent current device with a nominal 4 M Ω pull-down resistor on its enable pin (EN). The package is a space-saving 0.8 mm \times 0.8 mm, 4-ball WLCSP.

Figure 29. Functional Block Diagram

APPLICATIONS INFORMATION

GROUND CURRENT

The major source for ground current in the ADP199 is the internal charge pump for the FET drive circuitry. Figure 30 shows the typical ground current when $V_{EN} = V_{IN}$, and varies from 1.1 V to 3.6 V.

Figure 30. Ground Current vs. Input Voltage, Different Load Current

ENABLE FEATURE

The ADP199 uses the EN input to enable and disable the V_{OUT} output. As shown in Figure 31, when a rising voltage (V_{EN}) on the EN pin crosses the active threshold, V_{OUT} turns on. When a falling voltage (V_{EN}) on the EN pin crosses the inactive threshold, V_{OUT} turns off.

Figure 31. Typical EN Operation, $V_{IN} = 3.3$ V

Figure 32. Typical EN Operation, $V_{IN} = 1.2$ V

As shown in Figure 31, the EN pin has hysteresis built into it. This prevents on/off oscillations that can occur due to noise on the EN pin as it passes through the threshold points.

The EN pin active/inactive thresholds derive from the V_{IN} voltage; therefore, these thresholds vary with the changing input voltage. Figure 33 shows the typical EN active/inactive thresholds when the input voltage varies from 1.1 V to 3.6 V.

Figure 33. Typical EN Thresholds vs. Input Voltage (V_{IN})

TIMING

Turn-on delay is defined as the interval between the time that V_{EN} exceeds the rising threshold voltage and when V_{OUT} rises to $\sim 10\%$ of its final value. The ADP199 includes circuitry that has a typical 1 ms turn-on delay, and a controlled rise time to limit the V_{IN} inrush current. As shown in Figure 34 and Figure 35, the turn-on delay is nearly independent of the input voltage.

Figure 34. Typical Turn-On Delay Time with $V_{IN} = 1.2\text{ V}$, $I_{LOAD} = 10\text{ mA}$, $C_{LOAD} = 1\text{ }\mu\text{F}$

Figure 36. Typical Rise Time and Inrush Current, $C_{LOAD} = 100\text{ }\mu\text{F}$, $V_{IN} = 1.2\text{ V}$, $I_{LOAD} = 100\text{ mA}$

Figure 35. Typical Turn-On Delay Time with $V_{IN} = 3.6\text{ V}$, $I_{LOAD} = 10\text{ mA}$, $C_{LOAD} = 1\text{ }\mu\text{F}$

Figure 37. Typical Rise Time and Inrush Current, $C_{LOAD} = 100\text{ }\mu\text{F}$, $V_{IN} = 3.6\text{ V}$, $I_{LOAD} = 100\text{ mA}$

The rise time is defined as the time it takes the output voltage to rise from 10% to 90% of V_{OUT} reaching its final value. It is dependent on the rise time of the internal charge pump.

For very large values of output capacitance, the RC time constant (where C is the load capacitance (C_{LOAD}) and R is the $R_{DS_{ON}} || R_{LOAD}$) can become a factor in the rise time of the output voltage. Because $R_{DS_{ON}}$ is much smaller than R_{LOAD} , an adequate approximation for RC is $R_{DS_{ON}} \times C_{LOAD}$. An input or load capacitor is not required for the ADP199 although capacitors can be used to suppress noise on the board.

The turn-off time is defined as the time it takes for the output voltage to fall from 90% to 10% of V_{OUT} reaching its final value. The turn-off time is also dependent on the RC time constant of the output capacitance and load resistance. Figure 38 shows the typical turn-off time with $V_{IN} = 1.8\text{ V}$, $C_{OUT} = 1\text{ }\mu\text{F}$, and $R_{LOAD} = 18\text{ }\Omega$.

NOTES

NOTES

Компания «Life Electronics» занимается поставками электронных компонентов импортного и отечественного производства от производителей и со складов крупных дистрибьюторов Европы, Америки и Азии.

С конца 2013 года компания активно расширяет линейку поставок компонентов по направлению коаксиальный кабель, кварцевые генераторы и конденсаторы (керамические, пленочные, электролитические), за счёт заключения дистрибьюторских договоров

Мы предлагаем:

- Конкурентоспособные цены и скидки постоянным клиентам.
- Специальные условия для постоянных клиентов.
- Подбор аналогов.
- Поставку компонентов в любых объемах, удовлетворяющих вашим потребностям.
- Приемлемые сроки поставки, возможна ускоренная поставка.
- Доставку товара в любую точку России и стран СНГ.
- Комплексную поставку.
- Работу по проектам и поставку образцов.
- Формирование склада под заказчика.
- Сертификаты соответствия на поставляемую продукцию (по желанию клиента).
- Тестирование поставляемой продукции.
- Поставку компонентов, требующих военную и космическую приемку.
- Входной контроль качества.
- Наличие сертификата ISO.

В составе нашей компании организован Конструкторский отдел, призванный помогать разработчикам, и инженерам.

Конструкторский отдел помогает осуществить:

- Регистрацию проекта у производителя компонентов.
- Техническую поддержку проекта.
- Защиту от снятия компонента с производства.
- Оценку стоимости проекта по компонентам.
- Изготовление тестовой платы монтаж и пусконаладочные работы.
