DESCRIPTION

The UPC8151TB is a silicon RFIC designed as a buffer amplifier for cellular or cordless telephones. This low current amplifier operates on 3.0 V and is housed in a 6 pin super minimold package.

The IC is manufactured using the 20 GHz f_T NESAT™ III silicon bipolar process. This process uses silicon nitride passivation film and gold electrodes. These materials protect the chip surface from external pollution and prevent corrosion/migration. Thus, this IC has excellent performance, uniformity and reliability.

PIN FUNCTIONS

Pin No.	Symbol	Applied Voltage	Description	Internal Equivalent Circuit
1	INPUT		Signal input pin. An internal matching circuit provides a 50 Ω match over a wide bandwidth. This pin must be coupled to signal source with a blocking capacitor.	
4	OUTPUT	V _{CC} through external inductor.	Signal output pin. This output is designed as an open collector. Due to the high impedance output this pin should be externally equipped with an LC matching circuit.	
6	V _{CC}	2.4 to 3.3	Power supply pin. This pin should be externally equipped with a bypass capacitor to minimize ground impedance.	
2 3 5	GND	0	Ground pin. This pin should be connected to system ground with minimum inductance. Ground pattern on the board should be formed as wide as possible. All the ground pins must be connected together with wide ground pattern to minimize impedance difference.
