

CAT32

CMOS White LED Driver

Description

The CAT32 is a DC/DC step up converter that delivers a regulated output current. Operation at a constant switching frequency of 1.2 MHz allows the device to be used with very small value external inductor and ceramic capacitors.

The CAT32 is targeted to drive multiple white light-emitting diodes (LEDs) connected in series and provides the necessary regulated current to control the brightness and the color purity. An external resistor R_{SET} controls the output current level. LED currents of up to 40 mA can be supported over a wide range of input supply voltages from 2 V to 7 V, making the device ideal for battery-powered applications.

A high voltage output stage allows up to 4 White LEDs to be driven in series. Series drive provides inherent current matching.

LED dimming can be done by using a DC voltage, a logic signal, or a pulse width modulation (PWM) signal. The shutdown input pin allows the device to be placed in power-down mode with “near zero” quiescent current.

In addition to overcurrent limiting protection, the device also includes detection circuitry to ensure protection against open-circuit load fault conditions.

The device is available in a low profile (1 mm max height) 6-lead TSOT-23 package.

Features

- Low Quiescent Ground Current (0.5 mA Typical)
- Power Efficiency Over 80%
- Compatible Pinout with LT1932
- Adjustable Output Current (up to 40 mA)
- High Frequency 1.2 MHz Operation
- Input Voltage Operation down to 2.0 V
- Low Resistance (0.5 Ω) High Voltage Power Switch
- Drives up to 4 White LEDs in Series
- Shutdown Current Less than 1 μ A
- Load Fault Protection Against Open-circuits
- Low Value External Components
- Low Profile (1 mm) TSOT-23 6-lead Package
- These Devices are Pb-Free, Halogen Free/BFR Free and are RoHS Compliant

Applications

- Color LCD and Keypad Backlighting
- Cellular Phones
- Handheld Terminals
- Digital Cameras
- PDAs/Games
- Portable MP3 Players

Typical Application Circuit

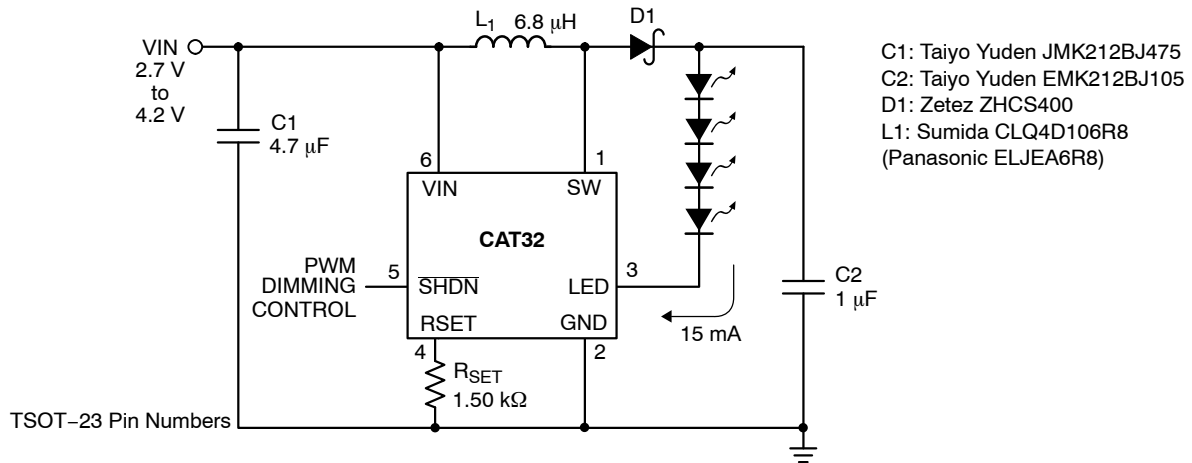

Figure 1. Li-Ion Driver for Four High-Brightness White LEDs

Table 1. PIN DESCRIPTION

| Pin Number SOT23 | Pin Number TDFN | Name | Function |
|---------------------|--------------------|--------------|---------------------------------------------------------------------------------------------------------------------------------------|
| 1 | 8 | SW | Switch pin. This is the drain of the internal power switch. For minimum EMI, minimize the trace area connected to this pin. |
| 2 | 5 | GND | Ground pin. Connect pin 2 to ground. |
| 3 | 6 | LED | LED (cathode) connection pin. |
| 4 | 4 | RSET | RESET pin. A resistor connected from pin 4 to ground sets the LED current. This pin is also used to dim the LEDs. |
| 5 | 3 | SHDN | Shutdown pin. |
| 6 | 2 | VIN | Input supply pin. This pin should be bypassed with a capacitor to ground. A 4.7 μF capacitor mounted close to the pin is recommended. |
| – | 1 | Power Ground | Power Ground |

Table 2. ABSOLUTE MAXIMUM RATINGS

| Parameter | Rating | Unit |
|-------------------------------------------|-------------|------|
| V_{IN} , LED, \overline{SHDN} voltage | 8 | V |
| SW voltage | 20 | V |
| RSET voltage | 1 | V |
| Storage Temperature Range | -65 to +150 | °C |
| Junction Temperature | 125 | °C |
| Lead Soldering Temperature (10 secs) | 300 | °C |
| ESD Rating – Human Body Model | 2000 | V |

Stresses exceeding Maximum Ratings may damage the device. Maximum Ratings are stress ratings only. Functional operation above the Recommended Operating Conditions is not implied. Extended exposure to stresses above the Recommended Operating Conditions may affect device reliability.

Table 3. RECOMMENDED OPERATING CONDITIONS

| Parameter | Range | Unit |
|--------------------------------------|-----------------------|---------|
| V_{IN} | 2 to 7 | V |
| Ambient Temperature Range | -40 to +85 | °C |
| Inductor L1 | 6.8 \pm 20% typical | μ H |
| Input Capacitor C1 | 4.7 \pm 20% typical | μ F |
| Output Capacitor C2 | 1.0 \pm 20% typical | μ F |
| I_{LED} with 1 to 4 LEDs in series | 0 to 20 | mA |

NOTE: Typical application circuit with external components is shown on page 2.

Operation

The CAT32 device is a high efficiency, constant frequency, current regulating boost converter.

The device includes a switch and an internally compensated loop for the regulation of the LED current.

Operation can be best understood by examining the block diagram. The RSET pin is regulated at 100 mV and the current through the external resistor will set the regulated current in the LEDs (from 5 mA to 40 mA) with a multiplication factor of 225.

While maintaining LED current regulation, the CAT32 automatically adjusts the LED pin voltage to be as low as possible. A low LED pin voltage ensures high efficiency.

Current through the internal power switch is continuously monitored cycle-by-cycle. If the current limit is exceeded, the switch is immediately turned off, protecting the device, for the remainder of the cycle.

PWM dimming operation can be achieved by switching the $\overline{\text{SHDN}}$ pin or by pulling the RSET pin higher than 0.1 V.

Capacitor Selection

Low ESR (equivalent series resistance) capacitors should be used at the output to minimize the output ripple voltage. The low ESR and small package options available with multilayer ceramic capacitors make them excellent choices. The X5R and X7R capacitor types are preferred because they retain their capacitance over wider voltage and temperature ranges than the Y5V or Z5U types. A 1.0 μF or 2.2 μF output capacitor is recommended for most applications.

The voltage rating of the output capacitor C2 depends on the number of LEDs driven in series. A 10 V ceramic capacitor is recommended when driving two LEDs. A 16 V ceramic capacitor is recommended when driving 3 or 4 LEDs.

Table 6. CERAMIC CAPACITOR MANUFACTURERS

| Supplier | Phone | Web |
|-------------|--------------|-----------------|
| Taiyo Yuden | 408.573.4150 | www.t-yuden.com |
| Murata | 814.237.1431 | www.murata.com |
| Kemet | 408.986.0424 | www.kemet.com |

Low profile ceramic capacitors with a 1 mm maximum height/thickness are available for designs height requirements. Ceramic capacitors also make a good choice for the input capacitor, which should be mounted as close as possible to the CAT32. A 2.2 μF or 4.7 μF input capacitor is recommended. Table 6 shows a list of several ceramic capacitor manufacturers. Consult the manufacturers for detailed information as new products and package options are introduced regularly.

Diode Selection

Schottky diodes, with their low forward voltage drop and fast switching speed, are the ideal choice for high efficiency applications. Table 7 shows several different Schottky diodes that work well with the CAT32. Make sure that the diode has a voltage rating greater than the output voltage. The diode conducts current only when the power switch is turned off (typically less than one-third the time), so a 0.4 A or 0.5 A diode will be sufficient for most designs.

Table 7. SCHOTTKY DIODE SUPPLIERS

| MBR0540 | |
| ZHCS400 | Zetex |

LED Current Programming

The LED current is programmed with a single resistor connected to the RSET pin. The RSET pin is internally regulated to 100 mV, which sets the current flowing out of this pin, ISET, equal to 100 mV/RSET. The CAT32 regulates the current into the LED pin, ILED, to 225 times the value of ISET. For the best accuracy, a 1% or better resistor is recommended. Table 8 shows several typical 1% RSET values.

Table 8. R_{SET} RESISTOR VALUES

| I _{LED} (mA) | R _{SET} |
|-----------------------|------------------|
| 40 | 562 Ω |
| 30 | 750 Ω |
| 25 | 909 Ω |
| 20 | 1.13 kΩ |
| 15 | 1.50 kΩ |
| 10 | 2.26 kΩ |
| 5 | 4.53 kΩ |

For other LED current values, use the following equation to choose R_{SET}:

$$R_{SET} = 255 \times \frac{0.1 \text{ V}}{I_{LED}}$$

Most white LEDs are driven at maximum currents of 15 mA to 20 mA. Some higher power designs will use two parallel strings of LEDs for greater light output, resulting in 30 mA to 40 mA (two strings of 15 mA to 20 mA) flowing into the LED pin.

LED Dimming with PWM Signal

PWM brightness control provides the widest dimming range (greater than 20:1). By turning the LEDs ON and OFF using the control signal the LEDs operate at either zero or full current, but their average current changes with the PWM signal duty cycle. Typically, a 5 kHz to 40 kHz PWM signal is used. PWM dimming with the CAT32 can be accomplished two different ways.

The SHDN pin can be driven directly or a resistor can be added to drive the RSET pin. If the SHDN pin is used, increasing the duty cycle will increase the LED brightness. Using this method, the LEDs can be dimmed and turned off completely using the same control signal. A 0% duty cycle signal will turn off the CAT32, reducing the total quiescent current to near zero.

If the RSET pin is used, increasing the duty cycle will decrease the brightness. Using this method, the LEDs are dimmed using RSET and turned off completely using SHDN. If the RSET pin is used to provide PWM dimming, the approximate value of R_{PWM} should be calculated (where V_{MAX} is the “HIGH” value of the PWM signal):

$$R_{PWM} = R_{SET} \times \left(\frac{V_{MAX}}{0.15 \text{ V}} - 1 \right)$$

**Figure 15. LED Dimming Circuits**

In addition to providing the widest dimming range, PWM brightness control also ensures the “purest” white LED color over the entire dimming range. The true color of a white LED changes with operating current, and is the “purest” white at a specific forward current, usually 15 mA or 20 mA. If the LED current is less than or more than this value, the emitted light becomes more blue. Applications involving color LCDs can find the blue tint objectionable.

When a PWM control signal is used to drive the SHDN pin of the CAT32, the LEDs are turned off and on at the PWM frequency. The current through them alternates between full current and zero current, so the average current changes with duty cycle. This ensures that when the LEDs are on, they can be driven at the appropriate current to give the purest white light. LED brightness varies linearly with the PWM duty cycle.

LED Dimming with a Logic Signal

For applications that need to adjust the LED brightness in discrete steps, a logic signal can be used. R_{MIN} sets the minimum LED current value (when the NMOS is OFF):

$$R_{MIN} = 255 \times \frac{0.1 \text{ V}}{I_{LED(MIN)}}$$

R_{INCR} determines how much LED current increases when the external NMOS switch is turned ON.

$$R_{INCR} = 255 \times \frac{0.1 \text{ V}}{I_{LED(Increase)}}$$

LED Dimming with a DC Voltage

$$R_{ADJ} = 225 \times \frac{V_{MAX} - 0.1 \text{ V}}{I_{LED(MAX)} - I_{LED(MIN)}}$$

PCB Layout Guidelines

The CAT32 is a high-frequency switching regulator and therefore proper PCB board layout and component placement can minimize noise and radiation and increase efficiency. To maximize efficiency, the CAT32 design has fast switch rise and fall times. To prevent radiation and high frequency resonance problems minimize the length and area of all traces connected to the SW pin and use a ground plane under the switching regulator.

The switch, schottky output diode and output capacitor signal path should be kept as short as possible. The ground connection for the R_{SET} resistor should be tied directly to the GND pin and not be shared with other components.

Компания «Life Electronics» занимается поставками электронных компонентов импортного и отечественного производства от производителей и со складов крупных дистрибьюторов Европы, Америки и Азии.

С конца 2013 года компания активно расширяет линейку поставок компонентов по направлению коаксиальный кабель, кварцевые генераторы и конденсаторы (керамические, пленочные, электролитические), за счёт заключения дистрибьюторских договоров

Мы предлагаем:

- Конкурентоспособные цены и скидки постоянным клиентам.
- Специальные условия для постоянных клиентов.
- Подбор аналогов.
- Поставку компонентов в любых объемах, удовлетворяющих вашим потребностям.
- Приемлемые сроки поставки, возможна ускоренная поставка.
- Доставку товара в любую точку России и стран СНГ.
- Комплексную поставку.
- Работу по проектам и поставку образцов.
- Формирование склада под заказчика.
- Сертификаты соответствия на поставляемую продукцию (по желанию клиента).
- Тестирование поставляемой продукции.
- Поставку компонентов, требующих военную и космическую приемку.
- Входной контроль качества.
- Наличие сертификата ISO.

В составе нашей компании организован Конструкторский отдел, призванный помогать разработчикам, и инженерам.

Конструкторский отдел помогает осуществить:

- Регистрацию проекта у производителя компонентов.
- Техническую поддержку проекта.
- Защиту от снятия компонента с производства.
- Оценку стоимости проекта по компонентам.
- Изготовление тестовой платы монтаж и пусконаладочные работы.
