

Tyco Electronics - Schrack has a reputation for sound technical experience and provides engineering and sales support in local markets which in turn leads to total customer satisfaction.

World-wide we build lasting relationships with our customers through the innovative combination of:

- high quality products
- individual application support and
- complete service.

As a specialist and innovator for relays we offer technically superior and environmentally friendly solutions for reliable electrical switching.

Our extensive knowledge of markets and technology ensure that our products and systems provide optimal solutions for our customers and their applications.

Relay Range

The ordering code structure does allow a large number of possible variations, but not all possible variations are defined as standard types (ordering codes) and thus not included in the product range.

Special versions to customer specifications can be supplied. Please contact your local sales organisation.

Technical data in this catalog are guidelines for appropriate use under standard conditions. For additional information please contact our technical support.

Data subject to change without prior notice.

Features

- 1 N/O contact
- Only 5 mm slim
- 3 A switching current
- Load range 1 mA up to 3 A
- Sensitive coil 120 mW
- Allows high function-/packing density
- Cadmium-free contacts
- Z type with reinforced insulation

Applications

Centralized and decentralized heating control, extremely narrow interface elements, interface technology, timers, PLC's, I/O modules, I/O-ports

Miniature Power PCB Relay RY II

1 pole 8 A

F0142-C

Features

- Low component height 12.3 mm
- 1 C/O or 1 N/O or 1 N/C contact
- 5 kV / 8 mm coil-contact
- Protection class II (VDE 0700)
- Pinnings: 3.2 and 5 mm
- Sockets with PCB-type or screw-type terminals
- Especially suitable for resistive and inductive loads on N/O and N/C contacts

Applications

Heating control, interface technology, domestic appliances, timers, temperature control

- 1C/O or 1N/O contact
- High inrush currents with AgSnO contacts (TV4 = 65 A)
- 4 kV/8 mm coil-contact
- Protection class II
- Ambient temperature up to 85°C at 8 A

Applications

HVAC, interface technology, power supplies, TV-/Monitor control, computer-/communication technology, domestic appliances, Hi-Fi products, timers

Power PCB Relay RT1

1 pole 12 / 16 A, DC- or AC-coil

F0144-B

Features

- 1 C/O or 1 N/O contact
- Sensitive coil 400 mW
- 5 kV / 10 mm coil-contact, Protection class II (VDE 0700)
- Ambient temperature 85°C (DC-coil)
- Height 15.7 mm
- Sockets with PCB-type or screw-type terminals
- Gold plated contacts available

Applications

Boiler control, timers, garage door control, POS automation, interface modules

Power PCB Relay U/UB

1 pole 7 A, mono or bistable

F0153-B

Features

- 1 C/O or 1 N/O or 1 N/C contact
- Bistable and DC-version
- Standard version with 230 mW pull-in power
- Sensitive version with 180 mW pull-in power
- Wash tight version
- Version for 10 A on request

Applications

Heating control, installation, battery powered equipment

Safety Relay SR6 sensitive

6 pole 8 A

F0206-B

Features

- Forcibly guided contacts according to EN50205
- polarized, monostable with 800 mW coil power consumption
- Smallest 6 pole safety relay with either 4 N/O+2 N/C or 3 N/O+3 N/C or 5 N/O+1 N/C contacts
- 6 kV surge resistance between poles

Applications

Emergency shut-off, press control, machine control, elevator and escalator control, safety modules

Power Relay RM 2/3/7

2 / 3 pole 10 / 16 A, DC- or AC-coil

Features

- 2 C/O or 3 C/O contacts
- Switching capacity up to 6000 VA
- DC- or AC-coil
- Mechanical indicator
- Push-to-test-button
- Plug-in version, PCB terminals, chassis- or DIN-rail mount

Applications

Elevator control, power supplies

and similar design: pinning 3.2 / 5 mm

Features

- Socket with PCB- or screw terminals
- No reduction of protection class or creepage/clearance with plastic retainer
- Easy replacement of relays
- Socket can be used as connector for diagnosis function
- Not suitable for MSR-type

AC 50/60Hz	3	6	18
AC 50/60Hz	10	18	30
AC 50/60Hz	12	18	30
AC 50/60Hz	13	18	30

Pulse tolerance is defined as a single pulse of a half sine wave (1/2 cycle or 8ms) that will not trip the breaker. An inertia wheel for increased pulse tolerance is available by specifying 'P' after the time delay curve number in the ordering key. The table at left lists pulse tolerance values of standard and inertia delay models.

To determine pulse tolerance multiply breaker rating by value in table. For example, a 2 A breaker with time delay curve 3 has a standard pulse tolerance of 12 A (2x6 A). The same breaker with an inertia delay has a pulse tolerance of 36 A (2 Ax18).

Safety Relays / Definitions

Relays with forcibly guided contacts

General information

Relays with forced guidance contacts play a decisive role in avoiding accidents on machines and in systems. Safety control circuits enable to switch into the fail safe state. Forcibly guided contacts monitor the function of the safety control circuits. For this safety function, all the assumed faults that can occur must already have been taken into consideration and their effects examined. Standard EN 50205 "Relays with forcibly guided contacts" contains current internationally-defined design requirements. Relays with forcibly guided contacts that comply with EN 50205 are also referred as "safety" relays.

Function

Power relays with forcibly guided (linked) contacts:

Power relays with at least one break contact and at least one make contact designed that by mechanical means make and break contacts can never be simultaneously in the closed position.

Contact gaps shall never be less than 0.5 mm over the operating life, not only under normal operating conditions, but also when a fault occurs.

This requirement allows the respective exclusive-or contact to detect the fault of a contact to open. For example, the welding of a make contact is indicated by the non-closing of the break contact when the energization is switched off.

To fulfill the specifications of the standard, the assumed faults must be considered:

Assumed fault	Effect
Failure of the contact to open due to welding	The failure of any make contact to open has the effect that none of the break contacts close even when the relay is not energized. The failure of any break contact to open has the effect that none of the make contacts close when the relay is energized.
Failure of the contact to open due to failure of the drive	The drive has no effect on the forcibly guided contact operation.
Breakage of the contact spring	Simultaneous closing of the break and make contacts is not possible even as a result of breakage. Completely insulated contact chambers (SR2, SR4, SR6) or barriers (SR2M) guarantee a contact gap of 0.5 mm.

Safety Relays / Definitions

Application example

The configuration of safety control circuits is basically only possible with specified fault conditions. Safety relays have the characteristic that make and break contacts can never both be closed at the same time.

The following circuit diagram shows an emergency stop control circuit consisting of three 4-pole safety relays.

The first fault to occur

- does not cause the safety function to fail because more components are used than required for the circuit to function (redundancy).
- prevents an restart and can be detected as a result (self monitoring)

Operation

- Closing the "ON" switch causes the K1 relay to be pulled in

- The K2 and K3 relays are energized via the make contacts K1-1 and K1-2 and hold themselves via K2-2 or K3-2
- The break contacts K2-1 and K3-1 cause the drop-out of K1 where the load circuit is released via the break contacts of K1-3 or K1-4.

Fault analysis (examples):

Type of fault	Is there any danger arising from the fault?	Is a restart possible?
Failure of contact K2-3 to open	No, K3-3 opens when the emergency stop switch is actuated	No, K2-1 and K2-3 cannot be closed at the same time (fault excluded by forcibly guided). "ON" button does not cause K1 to close
Failure of contact K1-3 to open	No, K2-3 and K3-3 open when the emergency stop switch is actuated	No, K1-1 and K1-2 cannot close due to closed K1-3. K2 and K3 are not energized

Definitions

AC-coil

Relays for direct energization with AC supply. The data is given for a 50 Hz supply.

Unless otherwise stated, the AC-coils may be used with 50 and 60 Hz supply. For 60 Hz data please contact our application support.

Ambient temperature

The temperature in the vicinity of the relay. The minimum ambient temperature is the minimum operating temperature, the maximum ambient temperature is the maximum operating temperature for the use of the relay. This temperature should not be exceeded. Ambient temperature range according to IEC 61810-1.

Approvals

The approvals confirm that the relay corresponds to the respective regulation for electrical components and equipment. The approvals are quoted for the respective relay types. However, they do not always refer to the entire spectrum of types of a relay.

Bistable relay, switching characteristics

In a bistable relay, the contacts remain in the last switching position after the input voltage is disconnected.

Bistable, polarized relay

A polarized bistable relay adopts one switching position on energizing in a particular direction and the other switching

position when the energizing is in the opposite direction. In a bistable relay with one winding, the opposite energizing is created by a voltage with opposite polarity being applied to the same winding.

In a bistable relay with two windings, the opposing energizing is created by a voltage being applied to the second winding with opposite winding sense.

Bistable, remanent relay (remanence relay)

A remanent, bistable relay adopts a particular switching position at an energizing direct current in any direction and is held in this position by the remanence in the magnetic circuit, i.e. through the magnetization of parts of the magnetic circuit. The contacts shift to the other switching position on a small energizing current of limited amplitude in the opposite direction. This demagnetizes the magnetic circuit.

Bounce

An unintentional phenomenon that can occur during the making or breaking of a contact circuit when the contact elements touch successively and separate again before they have reached their final position.

Bounce time

The time (typ.) from the first to the last closing or opening of a relay contact. The indicated times are for energization with nominal voltage (without any components in series or parallel to the coil) and at reference temperature.

Break contact

A contact that is closed in the rest state of the relay and open in the operating state.

Bridging contact

Compound contact with two simultaneously operating make contacts connected in series.

Category of protection (IEC61810)

The 'Relay Technology Categories' describe the degree of sealing of the relay case or its contact unit:

RT 0:	unenclosed relay Relay not provided with a protective case
RT I:	dust protected relay Relay provided with a case which protects its mechanism from dust
RT II:	flux proof relay Relay capable of being automatically soldered without allowing the migration of solder fluxes beyond the intended areas. These are the contacts, movable parts of the magnetic system and their immediate environment.
RT III:	wash tight (washable) relay Relay capable of being automatically soldered and subsequently undergoing a washing process to remove flux residues without allowing the ingress of flux or washing solvents. The test to evaluate the sealing of the case for wash tight relays and is performed according to the IEC 68-2-17, Qc test.

NOTE - In service this type of relay is sometimes vented to the atmosphere after soldering or washing process; in this case the requirements with respect to clearances and creepage distances can change.

RT IV:	sealed relay
RT V:	hermetically sealed relay

Definitions

Changeover contact

Compound contact consisting of a make contact and a break contact with a common terminal. On changing the switch position, the contact previously closed opens first followed by the closing of the contact that was previously open.

Clearance distance

Shortest distance in air between two conductive elements.

Coil operating range

Permissible range for the energizing voltage as function of the ambient temperature. The operating range is defined by the maximum voltage and the operate-/minimal voltage U_{min} (coil without preenergization) and/or the operate-/minimal voltage U_1 (preenergized coil).

Coil operating range for monostable relays with DC- or AC-coil:

- curve 1: operate-/minimal voltage U_0 (without preenergization)
- curve 2: operate-/minimal voltage U_1 (preenergized coil)
- curve 3: maximum voltage U_2 at contact current = 0A
- curve 4: maximum voltage U_2 at rated contact load I_{nom}

Coil operation range for bistable relays (remanence version)

- curve 1: operate voltage at coil temperature equal to ambient temperature (no preenergization or pulsed operation)
- curve 2: minimum reset/demagnetization voltage
- curve 3: maximum reset/demagnetization voltage at full contact load
- curve 4: maximum voltage at full contact load
- curve 5: maximum voltage at full contact load and pulsed operation (duty cycles)

Coil resistance

Electrical resistance of the relay coil at reference temperature.

Contact configuration

According to the different switching functions of the relay contacts the various contact configurations, design and description are specified in DIN 41020. See:

Contact material

The list gives an overview of the most important plating- and contact materials. The switching capacity of the contacts and the respective electrical endurance depends not only on the contact material but also to a high degree on the relay design. Decisive for the application therefore is the optimal combination of the mechanical system and the contact material. The characteristics for certain relay types cannot be transferred to other designs.

1) Plating materials:

Fine gold

- best corrosion resistance, not used as solid material because too soft, high tendency towards cold-welding
- gold platings $\leq 1 \mu\text{m}$ (hv), only as storage protection, no protection against aggressive atmosphere.

Hard gold / gold plated (htv)

- very good corrosion resistance, low and stable contact resistance at lowest loads, low tendency to cold welding
- dry-circuit switching (switching without current/voltage), recommended range of application 1 V...60 V, 1 mA...100 mA

Definitions

2) Contact materials:

Fine-grain silver AgNi0,15 / AgNi0.15 gold flashed

- relatively low contact resistance, low resistance against aggressive atmosphere
- universally applicable in medium and low load range, especially in DC-circuits, $\geq 12\text{ V}$, 10 mA

Silver-Nickel AgNi90/10

- high resistance against electrical wear, low welding tendency, higher contact resistance than AgNi0,15
- circuits with medium to high loads, DC- and AC-circuits, range of application $\geq 12\text{ V}$, 10 mA

Silver-Cadmium-Oxide AgCdO

- low welding tendency, high wear resistivity
- particularly suited for switching of inductive loads, AC-circuits, $\geq 12\text{ V}$, 100 mA

Silver-Tin-Oxide AgSnO₂

- low welding tendency, very high wear resistivity with heavy loads, low material transfer
- circuits with high requirements to make- and break currents, DC- and AC loads, $\geq 12\text{ V}$, 100 mA

Tungsten W

- highest melting point, high wear resistivity, for high switching rates and low ON-time
- as pre-contact in circuits with highest make- and break loads, $\geq 60\text{ V}$, 1 A

Contact resistance

Electrical resistance between the relay terminals of a closed contact, measured with indicated measuring current and voltage. The specified contact resistance is reached reliably only above a particular load. Considerably increased contact resistances can occur with smaller loads.

According to IEC 61810-7 the following measurement parameters based on the actual switching load are applied:

Contact type

See
- single contact

Category	Load		Measurement	
	V	A	V	A
cat. 0	0.03	0.01	0.03	0.01
cat. 1	0.03...60	0.01...0.1	0.1	0.01

cat. 3	5...600	0.1...100	24	1.0

- twin contact
- bridging contact
- forcibly guided contacts

Creepage distance

Shortest distance on the surface of an insulating material between two conductive elements.

C/O contact

See > changeover contact

Dielectric strength / dielectric test voltage

Voltage (rms value in AC voltage, 50Hz 1min) the insulation can withstand between relay elements that are insulated from one another.

Dust-proof relay

Relay with a case to protect against dust penetration.

Duty cycle

Ratio of the duration of energization to the total period of intermittent duty.

Drawings, Dimensions

Unless otherwise stated (see symbol below) technical drawings for product dimensions are using ISO Method E projection (European projection) according to ISO / R 128.

Electrical endurance/contact endurance/electrical life

Number of switching operations of a relay with electrical contact load defined under specified conditions without contact fault. The reference values specified for the endurance apply, unless otherwise specified, to a resistive load. The electrical endurance is reduced with an inductive ac load as a function of the power factor $\cos\phi$ (ϕ is the phase angle between the voltage and current. See reduction factor diagram.

Definitions

Flammability according to UL

Data of the flammability class according to the UL 94 (Underwriters Laboratories, Inc., USA) specification. This test for technical plastic is widespread. According to the burning characteristics 4 incendiary classes are classified: UL 94 HB, V-2, V-1, V-0.

flux proof/suitable for processing on soldering lines

See 'Category of protection (IEC 61810) - RT II
Relays for processing on soldering lines; a suitable sealing of the relay on the printed circuit board side prevents any flux entering the case.

Forcibly guided contacts

Contact configuration in which break and make contacts within the complete spring set are never closed at the same time even in case of malfunction as a result of contact welding. These relays are implemented in the control of safety technology for the protection against damage to persons or objects.

Immersion cleanable / wash tight

See 'Category of protection (IEC 61810) - RT III
Relays that can be cleaned, lacquered or cast-in together with the printed circuit board after soldering. The washing requires a suitable solvent.
The term "immersion cleanable / wash tight" is not identical with "hermetically sealed"!

Insulation according to IEC 60 664

Data for insulation co-ordination on:
- rated voltage (the voltage value above which the creepage distance is measured)
- pollution degree (classification of the pollution from external materials that affect the insulation)
- overvoltage category (classification of electrical equipment (here: relays) to the overvoltage to be expected)

Insulation according to VDE0110b (2/79)

Data for insulation co-ordination on:
- insulation category (classification of equipment according to environment and utilization conditions)
- reference voltage

Insulation resistance

Electrical resistance (initial condition) measured by applying a DC voltage of 500 V between two elements of a relay that are insulated from one another.

Limiting continuous current / continuous thermal load

The highest value of the current (effective value for alternating current) that the previously closed output circuit can permanently carry under specified conditions.

Make contact

A contact that is open in the rest state and closed in the operating state.

Make current / max. make current

The current a relay can switch on closing contacts under specified conditions. Unless otherwise stated the data refers to the current for a duration of max. 4s with a duty cycle of 10%.

Max. DC load breaking capacity / Load limit curve

Switching of loads at switching voltage and switching current below the load limit curve can be switched off reliably, i.e. the arc is extinguished (max. arc duration 10 ms at resistive load). The load limit curve is affected in both position and shape by the contact materials and relay construction (contact distance, break speed of the contacts, etc.). No statement on the electrical endurance is connected with these curves.

Maximum breaking voltage DC / AC

Maximum voltage that may occur between the switching contacts before closing or after opening the contact. (DC refers to direct current; AC refers to alternating current)
Data given for AC refer to a grounded 3-phase supply with 230 / 400 Vac.

Maximum voltage U_2 (coil).

The highest permissible input voltage at the reference temperature at which the relay, with continuous energization, heats up to its max. permissible coil temperature.

Mechanical endurance

Number of switching operations without contact load during which the relay remains within the specified characteristics.

Minimum switching power

Product of the switching current and switching voltage for reliable switching. Low contact resistance is reached reliably only above a particular load. Considerably increased contact resistances can occur with smaller loads.

Monostable relays, switching characteristics

A relay is called monostable when its contacts return automatically to the rest position after the input voltage is disconnected.

Monostable, neutral relay, non-polarized relay

A neutral, monostable relay operates independently of the direction of the energizing direct current.

Monostable, polarized relay

A polarized, monostable relay only operates in a specific direction of energization. It then adopts the operating state.

Mounting position

Normally the relay can be mounted in any position if no restricting specifications are given.

Nominal power

Power consumption of the coil at nominal voltage and nominal coil resistance.

Nominal voltage (coil), Rated coil voltage

Nominal voltage at which the relay displays the operating characteristics.

Non-release voltage

The value of the input voltage at which a monostable relay does not release.

N/C contact

See > break contact

N/O contact

See > make contact

Definitions

Operate

Process in which a relay shifts from the rest state to the operating state.

Operate category

According to IEC 61810.

Operate power

Coil power at which the relay operates.

Operate time

The time interval that elapses from energizing a relay in the rest state with the nominal voltage (pulse or square signal) to the moment when the last output circuit is closed or opened (bounce time not included).

Operate voltage/Minimum voltage U_1 , preenergized

The lowest permissible input voltage at which the relay operates reliably at the reference temperature even after continuous energization (preenergizing) and brief de-energizing.

Operate voltage / Minimum voltage U_0 , without preenergizing

Minimum permissible voltage at the winding at which the relay operates, for a coil temperature of the reference temperature (20°C coil temperature without preenergizing).

Operation

Single activation and release of a relay.

Packaging unit

Minimum delivery quantity (e.g. plastic bar) and quantity per box.

Plug-in relays

Relays that are held in the socket by flat plug-in terminals (round pins for MT) where electrical contact is established simultaneously.

Print relays

Relays designed for soldering into printed circuits.

Protection category / sealing

For definition of relay protection see 'Category of protection (IEC 61810) - Relay Technology Categories

Rated coil voltage

Nominal voltage at which the relay displays the operating characteristics.

Rated current (contacts)

Current a relay can switch on and off under specified conditions.

Rated voltage (contacts)

Voltage between the switching contacts before closing or after opening of the contact. (DC refers to direct current; AC refers to alternating current)

Rated voltage (insulation)

The reference voltage for the measurement of the creepage distance according to IEC 60 664-1 and VDE0110b.

Relay cycles (dynamic response)

Due to the self induction of the coil and the inertia of the parts to be moved, on activating a relay the operations do not take place suddenly. The function diagram below shows the different cycles for the most important relay configurations of undelayed power relays. The cycles specified apply to energizing with nominal voltage (without any components in series or parallel to the coil) and at the reference temperature.

- operate time
- release time/reset time
- bounce time
- transit time
- minimum energization time

Relay Technology Categories

The 'Relay Technology Categories' describe the degree of sealing of the relay case or its contact unit. See 'Categories of protection'

Release

Process in which a monostable relay shifts from the operating state back to the rest state.

Release time

The time interval (typ.) that elapses from the point of time at which a monostable relay in the operating state has the nominal voltage disconnected to the point of time at which the last output circuit has closed or opened (not including the bounce time). The indicated times are valid for energization with nominal voltage (without any components in series or parallel to the coil) and at reference temperature.

Release voltage

The input voltage at which a monostable relay returns to the rest state at the reference temperature.

Reset

Process in which a bistable relay returns from the operating state back to the rest state.

Definitions

Reset time

The time interval (typ.) that elapses from the point of time at which a bistable relay in the operating state has the nominal voltage applied in the opposite direction to the point of time at which the last output circuit has closed or opened (not including the bounce time).

Reset voltage

The lowest input voltage at which a bistable relay shifts from the operating state into the rest state at the reference temperature.

Rest state

Switch position of a monostable relay in the unenergized state. In bistable relays this is the switch position specified by the manufacturer. The contact position is not defined at delivery.

Safety relays

The compliance with regulations for the safety of persons and material is imperative in our technical world. National and international regulations take various risks into account. These safety standards also make demands on components which share with their function the safety level of a plant, machine or the equipment. For safety relays the demand for forcibly guided contact system according ZH1/457, issued by the professional association applies; the contacts have to be linked mechanically in a way, that N/O and N/C contacts may not be closed at the same time. It has to be ensured that over the entire life and even in case of malfunction (e.g. contact welding) the contact gap will be at least 0.5mm. If specified they also comply with the wider requirements according to prEN 50205 "relays with forcibly guided contacts"

Shock resistance (destruction)

This test is used to evaluate the resistance of the relay to mechanical shocks such as those that could occur in transport or during operation (no permanent damage to the relay). This test is performed according to the IEC 68-2-27, Ea test.

Shock resistance (function)

This test is used to evaluate the resistance of the relay to mechanical shocks such as those that could occur in transport or during operation (no opening of closed relay contacts or closing of open relay contacts with a duration $>10 \mu\text{s}$ is allowed to occur during the test). This test is performed according to the IEC 68-2-27, Ea test.

Single contact

Contact system with one contact piece per contact spring.

Surge voltage / test surge voltage

Amplitude of a voltage impulse of short duration with a specified impulse form and polarity that is applied to test insulation paths in the relay.

Switching current

Current a relay can switch on and off under specified conditions.

Switching power

Product of the switching current and switching voltage (in W for direct current, in VA for alternating current).

Switching rate

Number of operations per unit of time.

Switching voltage

Voltage between the switching contacts before closing or after opening of the contact. (DC refers to direct current; AC refers to alternating current)

Tracking resistance

Evaluation of insulating materials by determining their creepage distance formation, specified by the so-called comparative number of creepage formation (CTI) according to IEC 112.

Twin contact

A compound contact consisting of two simultaneously operating make contacts with a common contact spring. Twin contacts increase the contact reliability considerably, especially when switching low currents and voltages (dry circuits).

Vibration resistance (function)

This test is used to evaluate the resistance of the relay to harmonic mechanical oscillations such as those that could occur in transport or during operation (no opening of closed relay contacts or closing of open relay contacts with a duration $>10 \mu\text{s}$ is allowed to occur during the test). This test is performed according to the IEC 68-2-6, Fc test.

Processing

Mounting

Unless otherwise stated the relay can be mounted in any position. The relays can be further processed in all of the usual commercial soldering and cleaning plants.

Insertion

No pressure should be exerted on the terminal pins after the relay has been inserted in the printed circuit board. After insertion in the printed circuit board, the terminal pins should not be bent in order to fix them. Bending the terminal pins in relays sealed against washing can damage the sealing and could alter the relay parameters. However, if fixing must be carried out before soldering, use a pressure plate or similar.

Fluxing

The fluxing process should be set up so that the flux wets only the underside of the printed circuit board. The flux should only be visible as foam flux through any open perforations in the printed circuit board. If the printed circuit board is flooded by foam flux, bursting flux bubbles can lead to contamination in open relays and, consequently, to failures. To protect against corrosion, no acidiferous flux should be used. The recommended flux types are 1.1.3, 1.2.3 or 2.2.3 according to DIN EN 29454 T.1.

Preheating

In the normal preheating of flux, the temperature of the upper surface of the printed circuit board should not exceed 100°C. Ensure that any not completely dry flux exploding on being submerged in the solder wave does not penetrate the insides of open relays.

Soldering

PIN version

The relays in the PIN version are soldered according to the S-Sn60Pb40 or S-Sn63Pb37 solder types in accordance with DIN EN 29453. The solder bath temperature should be max. 260°C with a solder duration of approx. 3 s.

SMD version

The soldering processes approved for relays of the SMD version are condensation soldering (vapour phase), infrared soldering (radiation and/or convection) and full wave soldering.

Approved Soldering Techniques	Max. sold. duration	Max. sold. temp.
Condensation soldering (vapour phase)	40 s	215°C
Infrared soldering	40 s	215°C
Full wave soldering	10 s	260°C

Refer to the recommendations of CECC 00802 for the complete soldering profile.

Manual soldering

For manual soldering, we recommend a soldering temperature of 300 to 350 °C for a maximum soldering time of 2 s. The recommended solder type is pipe solder 1 DIN 8516-LSnPb zh/F-SW 32 to 34 (1 mm , 2.5 percentage by weight flux portion).

Cooling

The thermal loading resulting from the soldering process can be reduced at the end of the process by cooling.

Cleaning

We recommend avoiding washing processes in order to protect the environment. The fluxes we specify render a wash process unnecessary. If cleaning is required for other reasons, the following points must be observed independently of the washing process:

- the printed circuit boards must be washed immediately after the soldering process!
- the washing process must be set up so that any accumulation of washing fluid inside the relay is avoided!
- the individual wash stations must be separate from one another to prevent cross-contamination!
- after the final washing process, the printed circuit boards must be cleaned again using a clean washing medium!
- After washing, compressed air should be used to blow off the printed circuit board to speed up the drying process.

Protective lacquering

For the protective lacquering of the mounted printed circuit boards, we recommend single-component lacquer that is applied by immersion.

The maximum drying temperature should be 70 °C.
