

MAX9276A/MAX9280A Evaluation Kits

Evaluate: MAX9276A/MAX9280A

General Description

The MAX9276A/MAX9280A coax evaluation kits (EV kit) provide a proven design to evaluate the MAX9276A/MAX9280A high-bandwidth gigabit multimedia serial link (GMSL) deserializers with spread spectrum and full-duplex control channel with the use of a standard FAKRA coaxial cable. The EV kit also includes Windows XP®, Windows Vista®, and Windows 7-compatible software that provides a simple graphical-user interface (GUI) for exercising the features of the device. The EV kit comes with a MAX9276A or MAX9280A installed.

For complete GMSL evaluation, using a standard FAKRA coaxial cable, order the MAX9276A/MAX9280A coax EV kit and a companion serializer board (MAX9275/MAX9279 coax EV kit referenced in this document). For evaluating with STP cable, also order the MAXCOAX2STP-HSD adapter kit and refer to its data sheet. Only one adapter kit is required per link, connecting the serializer and deserializer (SerDes) boards.

Ordering Information appears at end of data sheet.

Items Included in the EV Kit Package

DESCRIPTION	QTY
MAX9276A coax EV kit or MAX9280A coax EV kit board	1
USB cable	1

MAX9276A/MAX9280A EV Kit Files

FILE	DESCRIPTION
MAXSerDesEV-D_Vxxxx_Install.EXE	Installs the EV kit files in your computer
MAXSerDesEV-D.EXE	Graphical user interface (GUI) application
CDM20600.EXE	Installs the USB device driver
USB_Driver_Help_200.PDF	USB driver installation help file

Features

- Accepts 24-Bit or 32-Bit Parallel Video
- Windows XP-, Windows Vista-, and Windows 7-Compatible Software
- USB-PC Connection (Cable Included)
- USB Powered
- Proven PCB Layout
- Fully Assembled and Tested

Note: In the following sections, MAX9276A/80A and the term “deserializer” refer to the MAX9276A and MAX9280A ICs and MAX9275/79 and the term “serializer” refer to the MAX9275 and MAX9279 ICs. The term SerDes refers to serializer/deserializer.

Note: This document applies to both coax and STP EV kits. This document covers coax cables, but the information provided applies equally to STP cables.

Windows, Windows XP, and Windows Vista are registered trademarks and registered service marks of Microsoft Corporation.

Quick Start

Required Equipment

- MAX9276A/MAX9280A coax EV kit (USB cable included)
- MAX9275/MAX9279 coax EV kit (USB cable included)
- 2m Rosenberger FAKRA cable assembly (included with the deserializer EV kit)
- Parallel data source (such as digital video)
- Optional: Function generator (needed only if parallel data lacks a pixel clock)
- User-supplied Windows XP, Windows Vista, or Windows 7 PC with a spare USB port (direct 500mA connection required; do not use a bus-powered hub)
- 5V DC, 500mA power supply

Note: In the following sections, software-related items are identified by bolding. Text in **bold** refers to items directly from the EV kit software. Text in **bold and underlined** refers to items from the Windows operating system.

Procedure

The EV kit is fully assembled and tested. Follow the steps below to verify board operation:

- 1) Download and install the EV kit software from www.maximintegrated.com/EVkitsoftware.
- 2) Install the appropriate USB driver for your PC from the links provided.
- 3) Verify that all jumpers are in their default positions, as shown in [Table 1](#).
- 4) With the power supply and function generator off, connect the 5V power supply to the +5VIN terminal pad on the serializer EV kit.
- 5) Connect the USB cable from the PC to the deserializer EV kit (J10). A Windows message appears when connecting the EV kit board to the PC for the first time. Each version of Windows has a slightly different message. If you see a Windows message stating **ready to use**, then proceed to the next step; otherwise, open the USB_Driver_Help_200.PDF to verify that the USB driver was successfully installed.
- 6) Connect the FAKRA cable from the serializer EV kit OUT+ connector to the deserializer EV kit IN+ connector.
- 7) Connect the parallel data source to the serializer EV kit headers (H1_DIN28:0).
- 8) Connect pixel clock or function generator to the serializer EV kit header (H1_PCLK_IN).
- 9) Turn on power supply and function generator.
- 10) Verify that LED_PWR on the serializer EV kit turns on, indicating that the board has power.
- 11) Verify that LED_D2 on the deserializer EV kit turns on, indicating that the microcontroller is powered and enabled.
- 12) Verify that LED_LOCK on the deserializer EV kit lights up, indicating that the link has been successfully established. If LED_LOCK is off or LED_ERROR is on, double-check that the PCLK_IN signal is clocking data.
- 13) Start the EV kit software by selecting **Start | Programs | Maxim Integrated | MAXSerDesEV-D | MAXSerDesEV-D**. The **Configuration Settings** window will appear ([Figure 1](#)). Jumper settings in this window are for user reference and guide to properly configure the evaluation board. Jumper settings do not force the serializer or deserializer into a particular mode of operation.
- 14) UART mode support: To configure for UART mode, on the deserializer board, change jumpers JU_I2CSEL from H to the L position. On the serializer board, change jumpers JU_CONF1 and JU_CONF0 as shown in the **Serializer** group box, JU_TXSCL from SCL to the TX position, and JU_RXSDA from SDA to the RX position.
- 15) Press the **Identify Devices** button to have the GUI scan the bus for possible listeners. In case no device was identified, the most likely cause is improper jumper settings. Identify the problem before continuing.
- 16) Press the **Connect** button to launch the **Evaluation Kit** window ([Figure 2](#)).
- 17) Press the **Read All** button to read all registers on the deserializer and serializer.

Detailed Description of Software

To start the MAX9276A/MAX9280A deserializer coax EV kit GUI, select **Start | Programs | Maxim Integrated | MAXSerDesEV-D | MAXSerDesEVGUI-D**.

Configuration Settings

The **Configuration Settings** window is the first window that opens after program launch. It allows the user to specify evaluation board setup and mode of operation.

Controller Group Box

In the **Controller** group box, select **Coax** or **STP** from the **LinkType** drop-down list, **I2C** or **UART** from the **Bus** drop-down list, and whether the **Serializer** or **Deserializer** should connect to the USB controller. Upon changing any of these parameters, any conflicting jumper settings will be highlighted, guiding the user to check and make the corresponding changes to the evaluation boards. Only **LinkType** and **Device Address** selections on the **Configuration Settings** window affect the EV kit operation. Other items, including jumper selection, are for user reference only.

Figure 1. MAXSerDesEV-D Evaluation Kit Software (Configuration Settings Window)

Serializer and Deserializer Jumper Selection Blocks

The **Serializer Jumper Selection** and **Deserializer Jumper Selection** blocks list jumpers for the selected **Device IDs** and displays the correct shunt positions based on the conditions selected in the **Controller** group box.

Identify Devices Button

The **Identify Devices** button causes the GUI to scan the system and hunt for slave addresses selectable by the SerDes input address pins. Upon successful communication, the identified **Device ID** and the corresponding jumper lists are displayed on the serializer and deserializer block. It is also possible to manually select a device from the list in the **Device ID** drop-down list and enter the slave address in the **Device Address** edit box. It is a good practice to utilize the **Identify Devices** function and verify communication with the devices under test (DUTs) before attempting to **Connect**.

[Figure 9](#) and [Figure 10](#) show jumper settings on the SerDes PCBs for coax cable and I2C communication with the USB controller connected to the deserializer board. Refer the respective deserializer IC data sheet for detailed configuration information. See [Table 1](#) for PCB jumper descriptions.

Connect Button

The **Connect** button opens up the **Evaluation Kit** window. The GUI reads the SerDes registers and updates the register maps for both. Successful register map updates are indicated by green LED indicators. In case of a communication problem, the LED indicators turn red.

Cancel - Do not Connect Button

The **Cancel - Do not Connect** button opens the **Evaluation Kit** window without attempting to connect to the on-board microcontroller. Although there will be no communication with the microcontroller, all functions and tabs corresponding to the selected **Device IDs** become active once there.

Evaluation Kit Window

The **Evaluation Kit** window shown in [Figure 2](#) provides access to all internal functions of the DUTs by means of reading and writing registers through different tabs to allow the user to evaluate various functions of the SerDes.

The **Read All** button updates the SerDes' device maps by reading the DUT's internal registers.

The **Serializer** group box provides pushbuttons to access the serializer's registers. The **Read all MAX9279** button reads register contents from the serializer and updates the displayed register values. The **Load** button reads and updates registers from a previously saved register map file or saves the existing register values into a new file for future reference using the **Save** button.

The **Deserializer** group box provides pushbuttons to access the deserializer's registers. The **Read All MAX9280/80A** button reads register contents from the deserializer and updates the displayed register values. The **Load** button reads and updates registers from a previously saved register map file or saves the existing register values into a new file for future reference using the **Save** button.

The **Open Configuration** button opens the **Configuration Settings** window for any configuration change. Use **Open Configuration** and **Connect** buttons to go back and forth between **Configuration Settings** window and **Evaluation Kit** window.

The **Wake Up** button applies the register write sequence described in the IC data sheets to wake the DUTs from sleep mode.

MAX9279 Tab

The **MAX9279** tab (Figure 2) lists the serializer's bitmaps. The **Read** and **Write** buttons in each register group box allow read/write access for each bit or group of bits that specify a function or condition, as defined in the serializer

IC data sheet. The color of the small LED indicator next to the **Read/Write** buttons indicates the communication status. Green indicates successful communication and red indicates failed communication.

Figure 2. MAXSerDesEV-D Evaluation Kit Software (MAX9279 Tab (Serializer))

MAX9280/MAX9280A Tab

The **MAX9280/MAX9280A** tab (Figure 3) lists the deserializer's registers and bitmaps. The **Read** and **Write** buttons in each register group box allows read/write access for each bit or group of bits that specify a function

or condition, as defined in the deserializer IC data sheet. The color of the small LED indicator next to the **Read/Write** buttons indicates the communication status. Green indicates successful communication and red indicates failed communication.

Figure 3. MAXSerDesEV-D Evaluation Kit Software (MAX9280A/80A Tab (Deserializer))

PRBS Test Tab

The **PRBS Test** tab (Figure 4) facilitates PRBS testing. Upon pressing the **Start** button, the SerDes registers are programmed, per defined sequence in the IC data sheets, to perform a pseudorandom bit sequence (PRBS) error-

rate test. Enter the test duration (maximum 32,767s = 9.1hrs) in the **Duration** edit box and press **Start** to begin the test. At the end of the specified elapse time, the number of bit errors are read from the **PRBSERR** register and displayed in the **PRBS Error Counter** box.

Figure 4. MAXSerDesEV-D Evaluation Kit Software (PRBS Tab)

MAX9276A/MAX9280A Evaluation Kits

Evaluate: MAX9276A/MAX9280A

Log and Low Level Access Tab

The **Log and Low Level Access** tab (Figure 5): logs all activities between the GUI and DUTs.

The **Register Access** group box allows 1-byte read or writes of the specified **Device Address** and **Register Address**. Press the **Send String to EVKIT** button

to communicate with devices that are not register-based (such as the MAX7324). User-supplied devices requiring other interface protocols must use the **Raw TX byte codes** to communicate. Note that in bypass mode, raw data is passed to the user-supplied slave device directly without modification.

Figure 5. MAXSerDesEV-D Evaluation Kit Software (Log and Low Level Access Tab)

HDPC Tab

The **HDPC** tab (Figure 6) is viewable only for serializers and deserializers that support HDPC function. The HDPC registers of both SerDes are listed side-by-side with **Read** and **Write** buttons for each register. **Authenticate** and **Enable Encryption**

pushbuttons initiate the HDPC verification process. At the end of the operation, the color of the LED indicator turns green to indicate success or red to indicate failure of the function. **Note:** This tab is only functional for DUTs that support the HDPC function.

Figure 6. MAXSerDesEV-D Evaluation Kit Software (HDPC Tab)

Look Up Tables Tab

The **Look Up Tables** tab (Figure 7) provides access to the lookup tables (LUTs) of the deserializer. Use this tab to program/view/edit the LUT settings of the red, green, and blue colors for color translation. LUT content edits can

be performed on the entire 256 bytes of all three colors, of an individual color, or individual pixel of any color table. The LUT contents can be saved in a .csv file to be used as a template or it can be uploaded from an existing file. Sample LUT content is provided in the evaluation kit GUI.

Figure 7. MAXSerDesEV-D Evaluation Kit Software: LUT Tables Window (Look Up Tables Tab—relevant only to deserializers with image-enhancing capability)

Figure 8. MAXSerDesEV-D Evaluation Kit Software (Look Up Table Read/Write Progress Window—relevant only to deserializers with image-enhancing capability)

Detailed Description of Hardware

The MAX9276A/MAX9280A deserializer coax EV kit provides a proven layout for the GMSL deserializers with the use of a standard FAKRA coax cable. On-board level translators and an easy-to-use USB-PC connection are included on the EV kit.

The deserializer EV kit board layout is divided into three principal sections:

- 1) Power-supply circuitry (on-board LDO regulators U2 and U3 power the AVDD, DVDD, and IOVDD supplies from +5VIN)
- 2) MAX9276A or MAX9280A and support components.
- 3) Microcontrollers (U10, U12) and support components

On-Board-Supplied Interface

The EV kit board provides a UART and I²C interface (through U10 and U12) that is intended to operate while both SerDes boards are powered on and locked. To use the on-board-supplied I²C interface, either use an IOVDD of 2.2V or greater with the I²C interface, or use a 100kbps I²C data rate.

User-Supplied Interface

To use the deserializer EV kit with a user-supplied interface, remove shunts from the JU_TXSCL header and apply a TX/SCL signal to the middle pin of the JU_TXSCL header. Also remove shunts from the JU_RXSDA header and apply an RX/SDA signal to the middle pin of the JU_RX_SDA header.

Refer to the respective SerDes IC data sheets for details about UART protocol for base mode, write data format, read data format, selecting base mode or bypass mode, and selecting a UART or I²C slave device.

User-Supplied Power Supply

The deserializer EV kit can be powered completely from the USB port by default. Jumper JU_VIN selects between the 5V USB supply or the +5VIN user-supplied power supply to power up U1 and supporting circuitry.

To provide different power supplies to AVDD, DVDD, and IOVDD, move the shunts on the JU_AVDD, JU_DVDD, and JU_IOVDD headers from the INT to the EXT positions and apply external user-supplied power at the AVDD_EXT, DVDD_EXT, and IOVDD_EXT terminals, respectively.

Detailed Description of Firmware

The DS89C450 microcontroller (U12) runs custom firmware that ensures no breaks occur within register read/write commands. The firmware records 9-bit even-parity data received from the USB interface while RTS is set, and plays back the 9-bit data with 1.5 stop bits timing when RTS is cleared. Data received by the deserializer is immediately relayed to the USB port.

The serializer coax EV kit provides a proven layout for the MAX9275/MAX9279 GMSL serializer with the use of a standard FAKRA coax cable. On-board level translators and an easy-to-use USB-PC connection are included on the EV kit.

Table 1. Jumper Description

JUMPER	SIGNAL	DEFAULT POSITION	FUNCTION
JU121	T2EX	L	U12-41 to GND (factory use only)
		H	U12-41 to USB+5V (factory use only)
		Open*	U12-41 open (factory use only)
JU_ADD0	CNTL0/ADD0	L*	(see Table 2)
		H	
JU_ADD1	CNTL3/ADD1	L*	(see Table 2)
		H	
JU_ADD2	INTOUT/ADD2	L*	(see Table 2)
		H	
JU_AVDD	AVDD	INT*	AVDD supplied internally
		EXT	AVDD supplied through the AVDD_EXT terminal
JU_BWS	BWS	L*	PCLKIN > 12.5MHz, 32-bit mode
		H	PCLKIN > 12.5MHz, 32-bit mode
		Open	PCLKIN > 33.33MHz 27-bit high bandwidth
JU_CXTP	CX/TP	L	STP link
		H*	Coax+ link
		Open	Coax- link
JU_DVDD	DVDD	INT*	DVDD supplied internally
		EXT	DVDD supplied through the AVDD_EXT terminal
JU_ENABLE	$\overline{\text{ENABLE}}$	L*	Outputs enabled
		H	Outputs disabled
JU_GPI	GPI	L*	GPI pin pulled low
		H	GPI pin pulled high
JU_GPIO0	GPIO0	L*	GPIO pin
		H	GPIO pin
JU_GPIO1	GPIO1	L*	GPIO pin
		H	GPIO pin
JU_HIM	SD/HIM	Open*	Reverse channel in legacy mode
		Short	Reverse channel in high-immunity mode
JU_I2CSEL	I2CSEL	L	UART-to-UART or UART-to-I ² C mode
		H*	I ² C-to-I ² C mode
JU_IOVDD	IOVDD	INT*	IOVDD supplied internally
		EXT	IOVDD supplied through the AVDD_EXT terminal
JU_LINK0	LINK0	X	Reserved for factory diagnostic test
JU_LINK1	LINK1	X	Reserved for factory diagnostic test
JU_MS	MS	L*	Base mode
		H	Bypass mode
JU_PWDN	$\overline{\text{PWDN}}$	L	Serializer is powered on
		H*	Serializer is powered off
JU_RXSDA	RX/SDA	RX	UART-to-UART or UART-to-I ² C mode
		SDA*	I ² C-to-I ² C mode

Open	High	High	High	0	1	0	X	1	0	X	R/ $\overline{W}$	48	5A

*CX/TP determines the serial cable type (CX/TP = open; addresses only for coax mode).

**X = 0 for the serializer address; X = 1 for the deserializer address.

***Default position.

Figure 10. MAX9275/MAX9279 Serializers (Initial Jumper Settings for Coax Link and I²C Communication)

Troubleshooting

Possible causes of board test failure:

- Coax cable not properly connected between OUT+ of the serializer to IN+ of the deserializer.
- PCLKIN is not applied (e.g., FG output is disabled): Verify signal at the pins on the board.
- PCLKIN function generator output is not correct: Verify signal at the pins on the board.
- Incorrect jumper setting on the deserializer board: Reverify.
- Incorrect jumper setting on the serializer board: Reverify.
- Bus selection on the GUI is not consistent with jumpers' position on the boards
- Check and verify that the USB cable has been properly connected.
- USB port has locked: Exit application/GUI; remove the USB cable from the board and reinsert and relaunch the GUI.
- Nuvoton μ C is not communicating: Exit the application/GUI and remove the USB cable from the board and reinsert, then relaunch the GUI.
- Deserializer board is faulty: Try a different board (if available).
- Serializer board is faulty: Try a different board (if available).

Компания «Life Electronics» занимается поставками электронных компонентов импортного и отечественного производства от производителей и со складов крупных дистрибьюторов Европы, Америки и Азии.

С конца 2013 года компания активно расширяет линейку поставок компонентов по направлению коаксиальный кабель, кварцевые генераторы и конденсаторы (керамические, пленочные, электролитические), за счёт заключения дистрибьюторских договоров

Мы предлагаем:

- Конкурентоспособные цены и скидки постоянным клиентам.
- Специальные условия для постоянных клиентов.
- Подбор аналогов.
- Поставку компонентов в любых объемах, удовлетворяющих вашим потребностям.
- Приемлемые сроки поставки, возможна ускоренная поставка.
- Доставку товара в любую точку России и стран СНГ.
- Комплексную поставку.
- Работу по проектам и поставку образцов.
- Формирование склада под заказчика.
- Сертификаты соответствия на поставляемую продукцию (по желанию клиента).
- Тестирование поставляемой продукции.
- Поставку компонентов, требующих военную и космическую приемку.
- Входной контроль качества.
- Наличие сертификата ISO.

В составе нашей компании организован Конструкторский отдел, призванный помогать разработчикам, и инженерам.

Конструкторский отдел помогает осуществить:

- Регистрацию проекта у производителя компонентов.
- Техническую поддержку проекта.
- Защиту от снятия компонента с производства.
- Оценку стоимости проекта по компонентам.
- Изготовление тестовой платы монтаж и пусконаладочные работы.
