

General Description

The 843S104I-133 is a PLL-based clock synthesizer specifically designed for low phase noise applications. This device generates a 133.33MHz differential LVPECL clock from an input reference of 25MHz. The input reference may be derived from an external source or by the addition of a 25MHz crystal to the on-chip crystal oscillator. An external reference is applied to the PCLK, nPCLK pins. The device offers spread spectrum clock output for reduced EMI applications. An I²C bus interface is used to enable or disable spread spectrum operation as well as to select either a down spread value of -0.35% or -0.5%. The 843S104I-133 is available in a lead-free 32-Lead VFQFN package.

Features

- Four LVPECL output pairs
- Crystal oscillator interface: 25MHz
- Differential PCLK, nPCLK input pair
- PCLK, nPCLK supports the following input types: LVPECL, CML, SSTL
- Output frequency: 133.33MHz
- PCI Express (2.5 Gb/s) and Gen 2 (5 Gb/S) jitter compliant
- RMS phase jitter @ 133.33MHz (12kHz – 20MHz): 1.2ps (typical)
- I²C support with readback capabilities up to 400kHz
- Spread Spectrum for electromagnetic interference (EMI) reduction
- 3.3V operating supply mode
- -40°C to 85°C ambient operating temperature
- Available lead-free (RoHS 6) package

Table 1. Pin Descriptions

Number	Name	Type		Description
1, 17, 21, 25, 28, 29	V _{CC}	Power		Core supply pins.
2	REF_SEL	Input	Pulldown	Select input for XTAL (LOW) or REF_IN (HIGH). LVCMOS/LVTTL interface levels.
3, 6, 8, 9, 10, 20, 24, 32	V _{EE}	Power		Negative power supply pins.
4	PCLK	Input	Pulldown	Non-inverting external 25MHz differential reference input. LVPECL input levels.
5	nPCLK	Input	Pullup/ Pulldown	Inverting external 25MHz differential reference input. LVPECL input levels.
7	V _{CCA}	Power		Analog supply for PLL.
11	V _{CC_XOSC}	Power		Analog supply for crystal oscillator.
12, 13	XTAL_IN, XTAL_OUT	Input		Crystal oscillator interface. XTAL_IN is the input. XTAL_OUT is the output.
14	nc	Unused		No connect.
15	SCLK	Input	Pullup	I ² C compatible SCLK. This pin has an internal pullup resistor. LVCMOS/LVTTL interface levels.
16	SDATA	I/O	Pullup	I ² C compatible SDATA. This pin has an internal pullup resistor. LVCMOS/LVTTL interface levels.
18,19	Q4, nQ4	Output		Differential output pair. LVPECL interface levels.
22, 23	Q3, nQ3	Output		Differential output pair. LVPECL interface levels.
26, 27	Q2, nQ2	Output		Differential output pair. LVPECL interface levels.
30, 31	Q1, nQ1	Output		Differential output pair. LVPECL interface levels.

NOTE: Pullup and Pulldown refers to internal input resistors. See Table 2, Pin Characteristics, for typical values.

Table 2. Pin Characteristics

Symbol	Parameter	Test Conditions	Minimum	Typical	Maximum	Units
C _{IN}	Input Capacitance			4		pF
R _{PULLUP}	Input Pullup Resistor			51		kΩ
R _{PULLDOWN}	Input Pulldown Resistor			51		kΩ

Serial Data Interface

To enhance the flexibility and function of the clock synthesizer, a two-signal I²C serial interface is provided. Through the Serial Data Interface, various device functions, such as individual clock output buffers, can be individually enabled or disabled. The registers

associated with the serial interface initialize to their default settings upon power-up, and therefore, use of this interface is optional. Clock device register changes are normally made upon system initialization, if any are required.

Data Protocol

The clock driver serial protocol accepts byte write, byte read, block write and block read operations from the controller. For block write/read operations, the bytes must be accessed in sequential order from lowest to highest byte (most significant bit first) with the ability to stop after any complete byte has been transferred. For byte write and byte read operations, the system controller can access individually

indexed bytes. The offset of the indexed byte is encoded in the command code, as described in Table 3A.

The block write and block read protocol is outlined in Table 3B, while Table 3C outlines the corresponding byte write and byte read protocol. The slave receiver address is 11010010 (D2h).

Table 3A. Command Code Definition

Bit	7	6, 5	4:0
Description	0 = Block read or block write operation, 1 = Byte read or byte write operation.	Chip select address, set to “00” to access device.	Byte offset for byte read or byte write operation. For block read or block write operations, these bits must be “00000”.

Absolute Maximum Ratings

NOTE: Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These ratings are stress specifications only. Functional operation of product at these conditions or any conditions beyond those listed in the *DC Characteristics* or *AC Characteristics* is not implied. Exposure to absolute maximum rating conditions for extended periods may affect product reliability.

Item	Rating
Supply Voltage, V_{CC}	4.6V
Inputs, V_I	-0.5V to $V_{CC} + 0.5V$
Outputs, I_O (LVPECL) Continuous Current Surge Current	50mA 100mA
Package Thermal Impedance, θ_{JA}	39.5°C/W (0 mps)
Storage Temperature, T_{STG}	-65°C to 150°C

DC Electrical Characteristics

Shunt Capacitance				7	pF

NOTE: Characterized using an 18pF parallel resonant crystal.

AC Electrical Characteristics

Table 6. AC Characteristics, $V_{CC} = 3.3V \pm 5\%$, $T_A = -40^{\circ}C$ to $85^{\circ}C$

Symbol	Parameter	Test Conditions	Minimum	Typical	Maximum	Units
f_{MAX}	Output Frequency			133.33		MHz
f_{REF}	Reference Frequency			25		MHz
$\sigma_{jit}(\emptyset)$	RMS Phase Jitter, (Random); NOTE 1	SSC Off, Integration Range: 12kHz – 20MHz		1.2		ps
t_j	Phase Jitter Peak-to-Peak; NOTE 2	Evaluation Band: 0Hz - Nyquist (clock frequency/2)		11		ps
$t_{REFCLK_HF_RMS}$	Phase Jitter rms; NOTE 3	133.33MHz 25MHz crystal input High Band: 1.5MHz - Nyquist (clock frequency/2)		1.3		ps
$t_{REFCLK_LF_RMS}$	Phase Jitter rms; NOTE 3	133.33MHz 25MHz crystal input Low Band: 10kHz - 1.5MHz		0.21		ps
odc	Output Duty Cycle		49		51	%
t_R / t_F	Output Rise/Fall Time		100		250	ps

NOTE: Electrical parameters are guaranteed over the specified ambient operating temperature range, which is established when the device is mounted in a test socket with maintained transverse airflow greater than 500 lfm. The device will meet specifications after thermal equilibrium has been reached under these conditions.

NOTE 1: Please refer to Phase Noise Plot.

NOTE 2: Peak-to-Peak jitter after applying system transfer function for the Common Clock Architecture. Maximum limit for PCI Express Gen 1 is 86ps peak-to-peak for a sample size of 10^6 clock periods. See IDT Application Note *PCI Express Reference Clock Requirements* and also the PCI Express Application section of this datasheet which show each individual transfer function and the overall composite transfer function.

NOTE 3: RMS jitter after applying the two evaluation bands to the two transfer functions defined in the Common Clock Architecture and reporting the worst case results for each evaluation band. Maximum limit for PCI Express Generation 2 is 3.1ps rms for $t_{REFCLK_HF_RMS}$ (High Band) and 3.0 ps RMS for $t_{REFCLK_LF_RMS}$ (Low Band). See IDT Application Note *PCI Express Reference Clock Requirements* and also the PCI Express Application section of this datasheet which show each individual transfer function and the overall composite transfer function.

Typical Phase Noise at 133.33MHz

Phase Noise Plot

Phase Noise Mask

Offset Frequency

f_1 f_2

RMS Jitter = $\sqrt{\text{Area Under the Masked Phase Noise Plot}}$

The diagram shows two digital signals, $nQ[1:4]$ and $Q[1:4]$, which are phase-inverted versions of each other. The signal $nQ[1:4]$ is high when $Q[1:4]$ is low, and vice versa. The pulse width t_{PW} is the duration of a high pulse for $nQ[1:4]$ (or a low pulse for $Q[1:4]$). The period t_{PERIOD} is the time interval between the start of two consecutive high pulses for $nQ[1:4]$.

$$odc = \frac{t_{PW}}{t_{PERIOD}} \times 100\%$$

The diagram shows two signals: $nQ[1:4]$ (input) and $Q[1:4]$ (output). The input signal transitions from a low level to a high level. The output signal transitions from a high level to a low level. The voltage levels are marked at 20% and 80% of the output swing V_{SWING} . The time interval t_R is the rise time of the input signal, and t_F is the fall time of the output signal.

Revision B April 28, 2016

Applications Information

Power Supply Filtering Technique

As in any high speed analog circuitry, the power supply pins are vulnerable to random noise. To achieve optimum jitter performance, power supply isolation is required. The 843S104I-133 provides separate power supplies to isolate any high switching noise from the outputs to the internal PLL. V_{CC} , V_{CC_XOSC} and V_{CCA} should be individually connected to the power supply plane through vias, and $0.01\mu\text{F}$ bypass capacitors should be used for each pin. *Figure 1* illustrates this for a generic V_{CC} pin and also shows that V_{CCA} requires that an additional 10Ω resistor along with a $10\mu\text{F}$ bypass capacitor be connected to the V_{CCA} pin.

Figure 1. Power Supply Filtering

Recommendations for Unused Input and Output Pins

Inputs:

LVCMOS Control Pins

All control pins have internal pullup and pulldowns; additional resistance is not required but can be added for additional protection. A $1\text{k}\Omega$ resistor can be used.

Crystal Inputs

For applications not requiring the use of the crystal oscillator input, both XTAL_IN and XTAL_OUT can be left floating. Though not required, but for additional protection, a $1\text{k}\Omega$ resistor can be tied from XTAL_IN to ground.

PCLK/nPCLK Inputs

For applications not requiring the use of a differential input, both the PCLK and nPCLK pins can be left floating. Though not required, but for additional protection, a $1\text{k}\Omega$ resistor can be tied from PCLK to ground.

Outputs:

LVPECL Outputs

All unused LVPECL outputs can be left floating. We recommend that there is no trace attached. Both sides of the differential output pair should either be left floating or terminated.

Crystal Input Interface

The 843S104I-133 has been characterized with 18pF parallel resonant crystals. The capacitor values, C1 and C2, shown in *Figure 2* below were determined using a 25MHz , 18pF parallel resonant crystal and were chosen to minimize the ppm error. The optimum C1 and C2 values can be slightly adjusted for different board layouts.

Figure 2. Crystal Input Interface

Overdriving the XTAL Interface

The XTAL_IN input can be overdriven by an LVCMOS driver or by one side of a differential driver through an AC coupling capacitor. The XTAL_OUT pin can be left floating. The amplitude of the input signal should be between 500mV and 1.8V and the slew rate should not be less than 0.2V/ns. For 3.3V LVCMOS inputs, the amplitude must be reduced from full swing to at least half the swing in order to prevent signal interference with the power rail and to reduce internal noise.

Figure 3A shows an example of the interface diagram for a high speed 3.3V LVCMOS driver. This configuration requires that the sum of the output impedance of the driver (R_o) and the series resistance (R_s) equals the transmission line impedance. In addition, matched termination at the crystal input will attenuate the signal in half. This

can be done in one of two ways. First, R_1 and R_2 in parallel should equal the transmission line impedance. For most 50Ω applications, R_1 and R_2 can be 100Ω. This can also be accomplished by removing R_1 and changing R_2 to 50Ω. The values of the resistors can be increased to reduce the loading for a slower and weaker LVCMOS driver. Figure 3B shows an example of the interface diagram for an LVPECL driver. This is a standard LVPECL termination with one side of the driver feeding the XTAL_IN input. It is recommended that all components in the schematics be placed in the layout. Though some components might not be used, they can be utilized for debugging purposes. The datasheet specifications are characterized and guaranteed by using a quartz crystal as the input.

Figure 3A. General Diagram for LVCMOS Driver to XTAL Input Interface

Figure 3B. General Diagram for LVPECL Driver to XTAL Input Interface

LVPECL Clock Input Interface

The PCLK /nPCLK accepts LVPECL, CML, SSTL and other differential signals. Both V_{SWING} and V_{OH} must meet the V_{PP} and V_{CMR} input requirements. Figures 4A to 4F show interface examples for PCLK/nPCLK input driven by the most common driver types. The

input interfaces suggested here are examples only. If the driver is from another vendor, use their termination recommendation. Please consult with the vendor of the driver component to confirm the driver termination requirements.

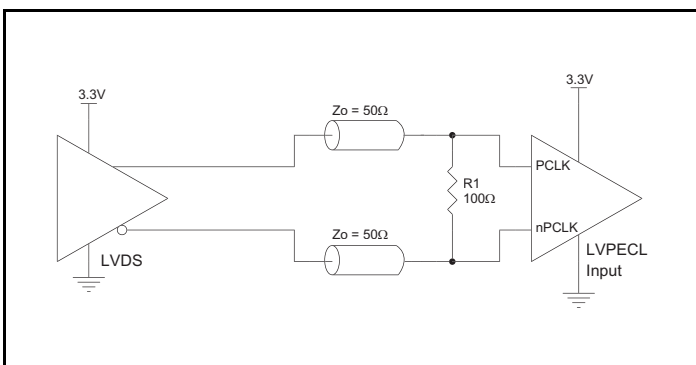

Figure 4E. PCLK/nPCLK Input Driven by a 3.3V LVDS Driver

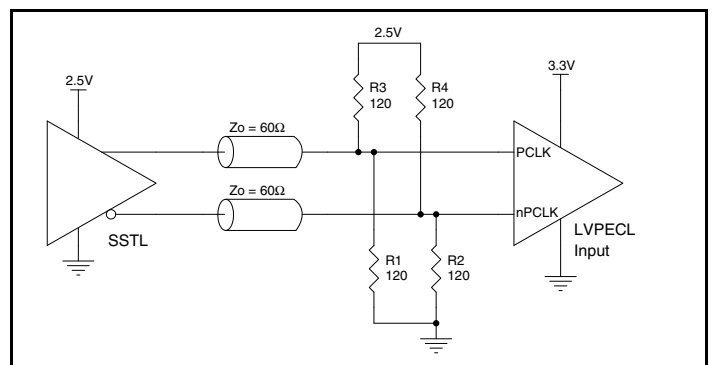

Figure 4F. PCLK/nPCLK Input Driven by an SSTL Driver

Termination for 3.3V LVPECL Outputs

The clock layout topology shown below is a typical termination for LVPECL outputs. The two different layouts mentioned are recommended only as guidelines.

The differential outputs are low impedance follower outputs that generate ECL/LVPECL compatible outputs. Therefore, terminating resistors (DC current path to ground) or current sources must be used for functionality. These outputs are designed to drive 50Ω

transmission lines. Matched impedance techniques should be used to maximize operating frequency and minimize signal distortion. *Figures 5A and 5B* show two different layouts which are recommended only as guidelines. Other suitable clock layouts may exist and it would be recommended that the board designers simulate to guarantee compatibility across all printed circuit and clock component process variations.

Figure 5A. 3.3V LVPECL Output Termination

Figure 5B. 3.3V LVPECL Output Termination

VFQFN EPAD Thermal Release Path

In order to maximize both the removal of heat from the package and the electrical performance, a land pattern must be incorporated on the Printed Circuit Board (PCB) within the footprint of the package corresponding to the exposed metal pad or exposed heat slug on the package, as shown in *Figure 6*. The solderable area on the PCB, as defined by the solder mask, should be at least the same size/shape as the exposed pad/slug area on the package to maximize the thermal/electrical performance. Sufficient clearance should be designed on the PCB between the outer edges of the land pattern and the inner edges of pad pattern for the leads to avoid any shorts.

While the land pattern on the PCB provides a means of heat transfer and electrical grounding from the package to the board through a solder joint, thermal vias are necessary to effectively conduct from the surface of the PCB to the ground plane(s). The land pattern must be connected to ground through these vias. The vias act as “heat pipes”. The number of vias (i.e. “heat pipes”) are application specific

and dependent upon the package power dissipation as well as electrical conductivity requirements. Thus, thermal and electrical analysis and/or testing are recommended to determine the minimum number needed. Maximum thermal and electrical performance is achieved when an array of vias is incorporated in the land pattern. It is recommended to use as many vias connected to ground as possible. It is also recommended that the via diameter should be 12 to 13mils (0.30 to 0.33mm) with 1 oz copper via barrel plating. This is desirable to avoid any solder wicking inside the via during the soldering process which may result in voids in solder between the exposed pad/slug and the thermal land. Precautions should be taken to eliminate any solder voids between the exposed heat slug and the land pattern. Note: These recommendations are to be used as a guideline only. For further information, please refer to the Application Note on the Surface Mount Assembly of Amkor’s Thermally/Electrically Enhance Leadframe Base Package, Amkor Technology.

Figure 6. P.C. Assembly for Exposed Pad Thermal Release Path – Side View (drawing not to scale)

Figure 7 shows an example of 843S104I-133 application schematic. In this example, the device is operated at $V_{CC} = 3.3V$. The 18pF parallel resonant 25MHz crystal is used. The C1 and C2 = 22pF are recommended for frequency accuracy. For different board layouts, the C1 and C2 may be slightly adjusted for optimizing

The diagram illustrates the ICS843S104I-133 LVPECL driver circuit. Key components and connections include:

- LVPECL Driver:** A differential output driver with two 50 Ohm termination points (Zo = 50 Ohm).
- VCC=3.3V:** The supply voltage for the driver.
- Logic Control Input Examples:**
 - Set Logic Input to '1':** VCC connected to RU1 (1K) and RD1 (1K) to the logic input pins.
 - Set Logic Input to '0':** VCC connected to RU2 (1K) and RD2 (1K) to the logic input pins.
- Termination Options:**
 - LVPECL Termination:** A differential termination network with resistors R1, R2, R5, R6 and capacitors C1, C2.
 - Optional Y-Termination:** A Y-termination network with resistors R13, R14, R15 and capacitor C3.
- Crystal and Oscillator:** A 25MHz crystal (X1) with capacitors C1, C2, C3, C4, C5, C6, C7, C8, C9, C10, C11, C12.
- Logic Control Inputs:** REF_SEL, PCLK, nPCLK, VCCA, VCC_XOSC, XTAL_IN, XTAL_OUT, SCLK, SDATA.

Revision B April 28, 2016

PCI Express Application Note

PCI Express jitter analysis methodology models the system response to reference clock jitter. The block diagram below shows the most frequently used *Common Clock Architecture* in which a copy of the reference clock is provided to both ends of the PCI Express Link.

In the jitter analysis, the transmit (Tx) and receive (Rx) serdes PLLs are modeled as well as the phase interpolator in the receiver. These transfer functions are called H1, H2, and H3 respectively. The overall system transfer function at the receiver is:

$$H_t(s) = H_3(s) \times [H_1(s) - H_2(s)]$$

The jitter spectrum seen by the receiver is the result of applying this system transfer function to the clock spectrum X(s) and is:

$$Y(s) = X(s) \times H_3(s) \times [H_1(s) - H_2(s)]$$

In order to generate time domain jitter numbers, an inverse Fourier Transform is performed on $X(s) \times H_3(s) \times [H_1(s) - H_2(s)]$.

PCI Express Common Clock Architecture

For **PCI Express Gen 1**, one transfer function is defined and the evaluation is performed over the entire spectrum: DC to Nyquist (e.g for a 100MHz reference clock: 0Hz – 50MHz) and the jitter result is reported in peak-peak.

PCI Express Gen 1 Magnitude of Transfer Function

For **PCI Express Gen 2**, two transfer functions are defined with 2 evaluation ranges and the final jitter number is reported in rms. The two evaluation ranges for PCI Express Gen 2 are 10kHz – 1.5MHz (Low Band) and 1.5MHz – Nyquist (High Band). The plots show the individual transfer functions as well as the overall transfer function Ht.

PCI Express Gen 2A Magnitude of Transfer Function

PCI Express Gen 2B Magnitude of Transfer Function

For **PCI Express Gen 3**, one transfer function is defined and the evaluation is performed over the entire spectrum. The transfer function parameters are different from Gen 1 and the jitter result is reported in RMS.

PCI Express Gen 3 Magnitude of Transfer Function

For a more thorough overview of PCI Express jitter analysis methodology, please refer to IDT Application Note *PCI Express Reference Clock Requirements*.

Power Considerations

This section provides information on power dissipation and junction temperature for the 843S104I-133. Equations and example calculations are also provided.

1. Power Dissipation.

The total power dissipation for the 843S104I-133 is the sum of the core power plus the power dissipated in the load(s). The following is the power dissipation for $V_{CC} = 3.3V + 5\% = 3.465V$, which gives worst case results.

NOTE: Please refer to Section 3 for details on calculating power dissipated in the load.

- Power (core)_{MAX} = $V_{CC_MAX} * I_{EE_MAX} = 3.465V * 130mA = 450.45mW$
- Power (outputs)_{MAX} = **32mW/Loaded Output pair**
If all outputs are loaded, the total power is $4 * 32mW = 128mW$

Total Power_{MAX} (3.3V, with all outputs switching) = $450.45mW + 128mW = 578.45mW$

2. Junction Temperature.

Junction temperature, T_j , is the temperature at the junction of the bond wire and bond pad directly affects the reliability of the device. The maximum recommended junction temperature is 125°C. Limiting the internal transistor junction temperature, T_j , to 125°C ensures that the bond wire and bond pad temperature remains below 125°C.

The equation for T_j is as follows: $T_j = \theta_{JA} * Pd_total + T_A$

T_j = Junction Temperature

θ_{JA} = Junction-to-Ambient Thermal Resistance

Pd_total = Total Device Power Dissipation (example calculation is in section 1 above)

T_A = Ambient Temperature

In order to calculate junction temperature, the appropriate junction-to-ambient thermal resistance θ_{JA} must be used. Assuming no air flow and a multi-layer board, the appropriate value is 39.5°C/W per Table 7 below.

Therefore, T_j for an ambient temperature of 85°C with all outputs switching is:

$85^\circ C + 0.578W * 39.5^\circ C/W = 107.8^\circ C$. This is below the limit of 125°C.

This calculation is only an example. T_j will obviously vary depending on the number of loaded outputs, supply voltage, air flow and the type of board (multi-layer).

Table 7. Thermal Resistance θ_{JA} for 32 Lead VFQFN, Forced Convection

θ_{JA} vs. Air Flow			
Meters per Second	0	1	2.5
Multi-Layer PCB, JEDEC Standard Test Boards	39.5°C/W	34.5°C/W	31.0°C/W

3. Calculations and Equations.

The purpose of this section is to derive the power dissipated into the load.

LVPECL output driver circuit and termination are shown in *Figure 8*.

Figure 8. LVPECL Driver Circuit and Termination

To calculate worst case power dissipation into the load, use the following equations which assume a 50Ω load, and a termination voltage of $V_{CC} - 2V$.

- For logic high, $V_{OUT} = V_{OH_MAX} = V_{CC_MAX} - 0.8V$
($V_{CC_MAX} - V_{OH_MAX}$) = **0.8V**
- For logic low, $V_{OUT} = V_{OL_MAX} = V_{CC_MAX} - 1.6V$
($V_{CC_MAX} - V_{OL_MAX}$) = **1.6V**

Pd_H is power dissipation when the output drives high.

Pd_L is the power dissipation when the output drives low.

$$Pd_H = [(V_{OH_MAX} - (V_{CC_MAX} - 2V))/R_L] * (V_{CC_MAX} - V_{OH_MAX}) = [(2V - (V_{CC_MAX} - V_{OH_MAX}))/R_L] * (V_{CC_MAX} - V_{OH_MAX}) = [(2V - 0.8V)/50\Omega] * 0.8V = \mathbf{19.2mW}$$

$$Pd_L = [(V_{OL_MAX} - (V_{CC_MAX} - 2V))/R_L] * (V_{CC_MAX} - V_{OL_MAX}) = [(2V - (V_{CC_MAX} - V_{OL_MAX}))/R_L] * (V_{CC_MAX} - V_{OL_MAX}) = [(2V - 1.6V)/50\Omega] * 1.6V = \mathbf{12.8mW}$$

$$\text{Total Power Dissipation per output pair} = Pd_H + Pd_L = \mathbf{32mW}$$

Reliability Information

Table 8. θ_{JA} vs. Air Flow Table for a 32 Lead VFQFN

θ_{JA} vs. Air Flow			
Meters per Second	0	1	2.5
Multi-Layer PCB, JEDEC Standard Test Boards	39.5°C/W	34.5°C/W	31.0°C/W

Transistor Count

The transistor count for 843S104I-133 is: 11,927

Ordering Information

Table 10. Ordering Information

Part/Order Number	Marking	Package	Shipping Packaging	Temperature
843S104BKI-133LF	ICS04BI133L	“Lead-Free” 32 Lead VFQFN	Tray	-40°C to 85°C
843S104BKI-133LFT	ICS04BI133L	“Lead-Free” 32 Lead VFQFN	Tape & Reel	-40°C to 85°C

Revision History Sheet

Rev	Table	Page	Description of Change	Date
B	T10		Updated header/footer throughout the datasheet.	10/20/15
			Deleted <i>IDT</i> prefix from part number.	
		11	Application Information, updated:	
		12	Updated <i>Overdriving the XTAL Interface</i> ,	
		14	<i>Termination for 3.3V LVPECL Outputs</i>	
		17	<i>PCI Express Application Note</i>	
		22	Ordering Information Table - deleted Tape & Reel Count, and table note.	
B			Updated data sheet headers and footers.	4/28/16

Компания «Life Electronics» занимается поставками электронных компонентов импортного и отечественного производства от производителей и со складов крупных дистрибьюторов Европы, Америки и Азии.

С конца 2013 года компания активно расширяет линейку поставок компонентов по направлению коаксиальный кабель, кварцевые генераторы и конденсаторы (керамические, пленочные, электролитические), за счёт заключения дистрибьюторских договоров

Мы предлагаем:

- Конкурентоспособные цены и скидки постоянным клиентам.
- Специальные условия для постоянных клиентов.
- Подбор аналогов.
- Поставку компонентов в любых объемах, удовлетворяющих вашим потребностям.
- Приемлемые сроки поставки, возможна ускоренная поставка.
- Доставку товара в любую точку России и стран СНГ.
- Комплексную поставку.
- Работу по проектам и поставку образцов.
- Формирование склада под заказчика.
- Сертификаты соответствия на поставляемую продукцию (по желанию клиента).
- Тестирование поставляемой продукции.
- Поставку компонентов, требующих военную и космическую приемку.
- Входной контроль качества.
- Наличие сертификата ISO.

В составе нашей компании организован Конструкторский отдел, призванный помогать разработчикам, и инженерам.

Конструкторский отдел помогает осуществить:

- Регистрацию проекта у производителя компонентов.
- Техническую поддержку проекта.
- Защиту от снятия компонента с производства.
- Оценку стоимости проекта по компонентам.
- Изготовление тестовой платы монтаж и пусконаладочные работы.
