DESCRIPTION

The SY88722V is a high speed current switch for driving a semiconductor laser diode in optical transmission applications. The modulation current (I_{OUT}) is controlled by the current (I_{RSET}) through the external resistor R_{SET} . The output OUT is HIGH and no current flows through OUT when output enable is HIGH.

The device incorporates complementary open collector outputs with a 30mA maximum current driving capability. The external resistor R_{EXT} must be placed between /OUT and V_{CC} to dissipate the worst case power. R_{SER} is recommended to compensate for laser diode matching issues. Pins 9 and 10 should be connected to achieve better performance.

The SY88722V utilizes the high performance bipolar ASSET™ technology.

APPLICATIONS

- 622Mbps SONET
