Allegro MicroSystems, Inc.

Ionization Smoke Detector with Interconnect

Discontinued Product

These parts are no longer in production The device should not be purchased for new design applications. Samples are no longer available.

Date of status change: November 2, 2009

Recommended Substitutions:

NOTE: For detailed information on purchasing options, contact your local Allegro field applications engineer or sales representative.
Ionization Smoke Detector with Interconnect

Features and Benefits
▪ Low average standby current for long battery life
▪ Interconnect up to 125 detectors
▪ Piezoelectric horn driver
▪ Guard outputs for detector input
▪ Pulse testing for low battery
▪ Power-on reset (POR)
▪ Internal reverse battery protection
▪ Inverted alarm polarity on DETECT IN

Package: 16-pin DIP (suffix A):
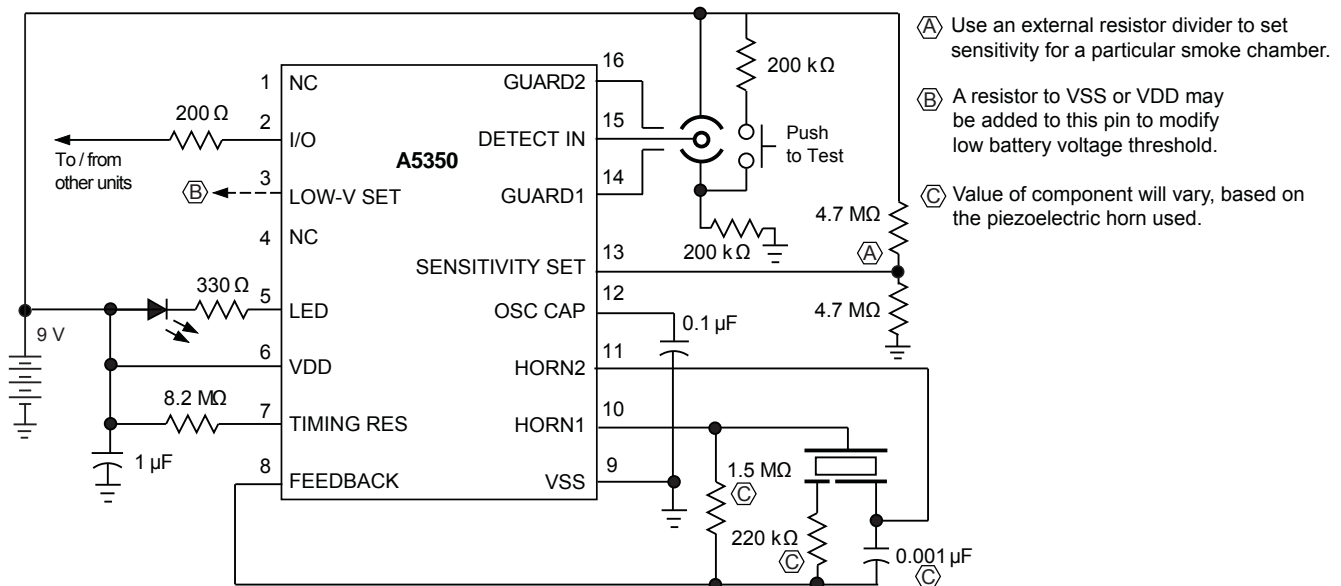

Not to scale

Description
The A5350 is a low-current, BiCMOS circuit providing all of the required features for an ionization-type smoke detector. A networking capability allows as many as 125 units to be interconnected so that if any unit senses smoke all units will sound their alarm. In addition, special features are incorporated to facilitate alignment and test of the finished smoke detector.

The internal oscillator and timing circuitry keep standby power to a minimum by powering down the device for 1.66 seconds and sensing for smoke for only 10 ms. Every 24 on-off cycles, a check is made for a low battery condition. By substituting other types of sensors or a switch for the ionization detector, this very-low–power device can be used in numerous other battery-operated safety/security applications.

The A5350 is supplied in a low-cost 16-pin dual in-line plastic package (DIP). It is rated for continuous operation over the temperature range of –10°C to 60°C. The Pb (lead) free version (suffix –T) has 100% matte tin leadframe plating.

Typical Application

Ⓐ Use an external resistor divider to set sensitivity for a particular smoke chamber.

Ⓑ A resistor to VSS or VDD may be added to this pin to modify low battery voltage threshold.

Ⓒ Value of component will vary, based on the piezoelectric horn used.

Selection Guide

Part Number	Pb-Free	Packing
A5350CA-T*	Yes	25 pieces per tube
A5350CA	–	

*Variant is in production but has been determined to be NOT FOR NEW DESIGN. This classification indicates that sale of the variant is currently restricted to existing customer applications. The variant should not be purchased for new design applications because obsolescence in the near future is probable. Samples are no longer available. Status change: May 4, 2009.

Absolute Maximum Ratings*

| Characteristic	Symbol	Notes	Rating	Units
Supply Voltage Range	V_{DD}	Referenced to V_{SS}	–0.5 to 15	V
Input Voltage Range	V_{IN}	Referenced to V_{SS}	–0.3 to V_{DD}+ 0.3	V
Reverse Battery Condition Duration	t_{RBAT}	10.5 V	20	s
Input Current	I_{IN}		10	mA
Operating Ambient Temperature	T_A		–10 to 60	ºC
Junction Temperature	$T_J(max)$		150	ºC
Storage Temperature Range	T_{stg}		–55 to 125	ºC

* CAUTION:BiCMOS devices have input static protection but are susceptible to damage when exposed to extremely high static electrical charges.

Thermal Characteristics

[1]Negative current is defined as coming out of the specified device pin (sourcing).
[2]Alarm (smoke) condition is defined as $V_{DETECTIN} > V_{SENSITIVITYSET}$; no alarm (no smoke) condition is defined as $V_{DETECTIN} < V_{SENSITIVITYSET}$.

Circuit Description

The A5350 is a low-current, BiCMOS circuit providing all of the required features for an ionization-type smoke detector. The alarm polarity on DETECT IN is inverted as compared with typical ion-type devices. The DETECT IN voltage must rise above the SENSITIVITY SET voltage in order to cause an alarm.

Oscillator
An internal oscillator operates with a period of 1.67 seconds during no-smoke conditions. Every 1.67 seconds, internal power is applied to the entire circuit for 10 ms and a check is made for smoke. Every 24 clock cycles (approximately 40 seconds), the LED pin is pulsed and a check is made for low battery by comparing V_{DD} to an internal reference. Because very-low currents are used in the device, the oscillator capacitor at the OSC CAP pin should be a low-leakage type (PTFE, polystyrene, or polypropylene).

Detector Circuitry
When the voltage on the DETECT IN pin is greater than the voltage on the SENSITIVITY SET pin, the A5350 evaluates this as a *smoke condition*.

An active guard is provided on GUARD1 and GUARD2, the two pins adjacent to the detector input, the DETECT IN pin. V_{GUARD1} and V_{GUARD2} will be within 100 mV of $V_{DETECTIN}$. This will keep surface leakage currents to a minimum and provide a method of measuring the input voltage without loading the ionization chamber. The active guard amplifier is not power strobed and thus provides constant protection from surface leakage currents. The detector input has internal diode protection against electrostatic damage.

Alarm Circuitry
If smoke is detected, the oscillator period changes to 40 ms and the horn is enabled. The horn output is typically 160 ms on, 80 ms off. During the off-time, smoke is checked and further alarm output will be inhibited if smoke is not sensed. During a smoke condition, the low-battery alarm is inhibited and the LED is pulsed approximately once every second.

Sensitivity Adjust
The detector sensitivity must be externally set to the individual characteristics of the ionization chamber by connecting the

5

SENSITIVITY SET pin to a resistor divider connected between the VDD and VSS pins.

Low Battery

The low battery condition threshold is set internally by a voltage divider connected between VDD and VSS. The threshold can be externally adjusted by connecting a resistor between the LOW-V SET pin and either the VDD or VSS pins.

To increase the threshold, a resistor can be connected between LOW-V SET and VSS. Given an initial threshold, $V_{(th)init}$ (nominally 7.5 V), and a target threshold, $V_{(th)set}$, the resistor should have the value:

$$R_{\text{LOWVSET}} = 600E3 \times K / (1 - 0.375 \times K) \ ,$$

where

$$K = 1 / (V_{(th)set} / [0.727 \times V_{(th)init}] - 1) \ .$$

To decrease the threshold, a resistor can be connected between LOW-V SET and VDD. Given an initial threshold, $V_{(th)init}$ (nominally 7.5 V), and a target threshold, $V_{(th)set}$, the resistor should have the value:

$$R_{\text{LOWVSET}} = 960E3 \times K / (0.6 - 1.6 \times K) \ ,$$

where

$$K = V_{(th)set} / (0.727 \times V_{(th)init}) - 1 \ .$$

The battery voltage level is checked approximately every 40 seconds during the (approximately) 10 mA, 10 ms LED pulse. If an LED is not used, it should be replaced with an equivalent resistor (typically 500 to 1000 Ω) such that the battery loading remains about 10 mA.

I/O

A connection to the I/O pin allows multiple smoke detectors to be interconnected. If any single unit detects smoke, its I/O pin is driven high (after a nominal 3 s delay), and all connected units will sound their associated horns. When the I/O pin is driven high by another device, the oscillator immediately speeds up to its 41.7 ms period. The remainder of the sped-up clock cycle, and two additional consecutive clock cycles with I/O high are required to cause an alarm. If the I/O pin falls below its threshold at any time during those (approximately) 83.4 ms, an internal latch is reset and there will not be an alarm. Thus, the I/O must remain high for (approximately) 93.9 ms in order to cause an alarm. This filtering provides significant immunity to I/O noise.

The LED is suppressed when an alarm is signaled from an interconnected unit, and any local alarm condition causes the I/O pin to be ignored as an input. This pin has an on-chip pulldown device and must be left unconnected if not used.
Testing

On power-up, all internal counters are reset. Internal test circuitry allows low battery check by holding the FEEDBACK and OSC CAP pins low during power-up, then reducing V_{DD} and monitoring the HORN1 pin. HORN1 will be driven high when V_{DD} falls below the low-battery threshold. All functional tests can be accelerated by driving the OSC CAP pin with a 2 kHz square wave. The 10 ms strobe period must be maintained for proper operation of the comparator circuitry.

Компания «Life Electronics» занимается поставками электронных компонентов импортного и отечественного производства от производителей и со складов крупных дистрибьюторов Европы, Америки и Азии.

С конца 2013 года компания активно расширяет линейку поставок компонентов по направлению коаксиальный кабель, кварцевые генераторы и конденсаторы (керамические, пленочные, электролитические), за счёт заключения дистрибьюторских договоров

Мы предлагаем:

- Конкурентоспособные цены и скидки постоянным клиентам.
- Специальные условия для постоянных клиентов.
- Подбор аналогов.
- Поставку компонентов в любых объемах, удовлетворяющих вашим потребностям.

- Приемлемые сроки поставки, возможна ускоренная поставка.
- Доставку товара в любую точку России и стран СНГ.
- Комплексную поставку.
- Работу по проектам и поставку образцов.
- Формирование склада под заказчика.

- Сертификаты соответствия на поставляемую продукцию (по желанию клиента).
- Тестирование поставляемой продукции.
- Поставку компонентов, требующих военную и космическую приемку.
- Входной контроль качества.
- Наличие сертификата ISO.

В составе нашей компании организован Конструкторский отдел, призванный помогать разработчикам, и инженерам.

Конструкторский отдел помогает осуществить:

- Регистрацию проекта у производителя компонентов.
- Техническую поддержку проекта.
- Защиту от снятия компонента с производства.
- Оценку стоимости проекта по компонентам.
- Изготовление тестовой платы монтаж и пусконаладочные работы.
