CY91460D Series

FR60 32-bit Microcontroller

CY91460D series is a line of general-purpose 32-bit RISC microcontrollers designed for embedded control applications which require high-speed real-time processing, such as consumer devices and on-board vehicle systems. This series uses the FR60 CPU, which is compatible with the FR family of CPUs.

This series contains the LIN-USART and CAN controllers.

Features

FR60 CPU Core

- 32-bit RISC, load/store architecture, five-stage pipeline
- 16-bit fixed-length instructions (basic instructions)
- Instruction execution speed: 1 instruction per cycle
- Instructions including memory-to-memory transfer, bit manipulation, and barrel shift instructions: Instructions suitable for embedded applications
- Function entry/exit instructions and register data multi-load store instructions : Instructions supporting C language
- Register interlock function: Facilitating assembly-language coding
- Built-in multiplier with instruction-level support
  - Signed 32-bit multiplication: 5 cycles
  - Signed 16-bit multiplication: 3 cycles
- Interrupts (save PC/PS) : 6 cycles (16 priority levels)
- Harvard architecture enabling program access and data access to be performed simultaneously
- Instructions compatible with the FR family

Internal Peripheral Resources

- General-purpose ports : Maximum 170 ports
- DMAC (DMA Controller)
  - Maximum of 5 channels able to operate simultaneously. (External to external : 1 channel)
  - 3 transfer sources (external pin/internal peripheral/software)
  - Activation source can be selected using software.
  - Addressing mode specifies full 32-bit addresses (increment/decrement/fixed)
  - Transfer mode (demand transfer/burst transfer/step transfer/block transfer)
  - Fly-by transfer support (between external I/O and memory)
  - Transfer data size selectable from 8/16/32-bit
  - Multi-byte transfer enabled (by software)
  - DMAC descriptor in I/O areas (200_H to 240_H, 1000_H to 1024_H)
- A/D converter (successive approximation type)
  - 10-bit resolution: 24 channels
  - Conversion time: minimum 1 µs
- External interrupt inputs : 14 channels
  - 8 channels shared with CAN RX or I2C pins
- Bit search module (for REALOS)
  - Function to search from the MSB (most significant bit) for the position of the first “0”, “1”, or changed bit in a word
- LIN-USART (full duplex double buffer): 5 channels
  - Clock synchronous/asynchronous selectable
  - Sync-break detection
  - Internal dedicated baud rate generator
- I^2C bus interface (supports 400 kbps): 3 channels
  - Master/slave transmission and reception
  - Arbitration function, clock synchronization function
- CAN controller (C-CAN): 3 channels
  - Maximum transfer speed: 1 Mbps
  - 32 transmission/reception message buffers
- Stepper motor controller : 6 channels
  - 4 high current output to each channel
  - 2 synchronized PWMs per channel (8/10-bit)
- Sound generator : 1 channel
  - Tone frequency : PWM frequency divide-by-two (reload value + 1)
- Alarm comparator : 1 channel
  - Monitor external voltage
  - Generate an interrupt in case of voltage lower/higher than the defined thresholds (reference voltage)
- 16-bit PPG timer : 12 channels
- 16-bit PFM timer : 1 channel
- 16-bit reload timer: 8 channels
- 16-bit free-run timer: 8 channels (1 channel each for ICU and OCU)
- Input capture: 8 channels (operates in conjunction with the free-run timer)
- Output compare: 4 channels (operates in conjunction with the free-run timer)
- Up/Down counter: 3 channels (3*8-bit or 1*16-bit + 1*8-bit)
- Watchdog timer
- Real-time clock
- Low-power consumption modes : Sleep/stop mode function
- Supply Supervisor: Low voltage detection circuit for external $V_{DD}5$ and internal 1.8V core voltage

- Clock supervisor
  - Monitors the sub-clock (32 kHz) and the main clock (4 MHz) , and switches to a recovery clock (CR oscillator, etc.) when the oscillations stop.
- Clock modulator
- Clock monitor
- Sub-clock calibration
  - Corrects the real-time clock timer when operating with the 32 kHz or CR oscillator
- Main oscillator stabilization timer
  - Generates an interrupt in sub-clock mode after the stabilization wait time has elapsed on the 23-bit stabilization wait time counter
- Sub-oscillator stabilization timer
  - Generates an interrupt in main clock mode after the stabilization wait time has elapsed on the 15-bit stabilization wait time counter

Package and Technology

- Package : QFP-208
- CMOS 0.18 μm technology
- Power supply range 3 V to 5 V (1.8 V internal logic provided by a step-down voltage converter)
- Operating temperature range: between − 40°C and + 105°C

5. Handling Devices

5.1 Preventing Latch-up

Latch-up may occur in a CMOS IC if a voltage higher than ($V_{DD}5$, $V_{DD}35$ or $HV_{DD}5$) or less than ($V_{SS}5$ or $HV_{SS}5$) is applied to an input or output pin or if a voltage exceeding the rating is applied between the power supply pins and ground pins. If latch-up occurs, the power supply current increases rapidly, sometimes resulting in thermal breakdown of the device. Therefore, be very careful not to apply voltages in excess of the absolute maximum ratings.

5.2 Handling of Unused Input Pins

If unused input pins are left open, abnormal operation may result. Any unused input pins should be connected to pull-up or pull-down resistor (2KΩ to 10KΩ) or enable internal pullup or pulldown resisters (PPER/PPCR) before the input enable (PORTEN) is activated by software. The mode pins MD_x can be connected to $V_{SS}5$ or $V_{DD}5$ directly. Unused ALARM input pins can be connected to $AV_{SS}5$ directly.

5.3 Power Supply Pins

In CY91460D series, devices including multiple power supply pins and ground pins are designed as follows; pins necessary to be at the same potential are interconnected internally to prevent malfunctions such as latch-up. All of the power supply pins and ground pins must be externally connected to the power supply and ground respectively in order to reduce unnecessary radiation, to prevent strobe signal malfunctions due to the ground level rising and to follow the total output current ratings. Furthermore, the power supply pins and ground pins of the CY91460D series must be connected to the current supply source via a low impedance.
It is also recommended to connect a ceramic capacitor of approximately 0.1 µF as a bypass capacitor between power supply pin and ground pin near this device.
This series has a built-in step-down regulator. Connect a bypass capacitor of 4.7 µF (use a X7R ceramic capacitator) to VCC18C pin for the regulator.

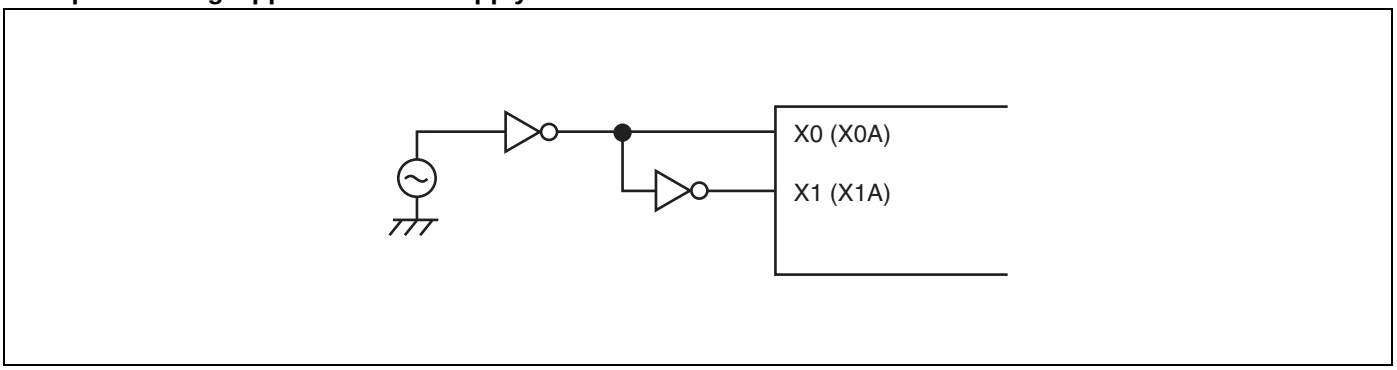
5.4 Crystal Oscillator Circuit

Noise in proximity to the X0 (X0A) and X1 (X1A) pins can cause the device to operate abnormally. Printed circuit boards should be designed so that the X0 (X0A) and X1 (X1A) pins, and crystal oscillator, as well as bypass capacitors connected to ground, are located near the device and ground.
It is recommended that the printed circuit board layout be designed such that the X0 and X1 pins or X0A and X1A pins are surrounded by ground plane for the stable operation.
Please request the oscillator manufacturer to evaluate the oscillational characteristics of the crystal and this device.

5.5 Notes on Using External Clock

When using the external clock, it is necessary to simultaneously supply the X0 (X0A) and the X1 (X1A) pins. In the described combination, X1 (X1A) should be supplied with a clock signal which has the opposite phase to the X0 (X0A) pins. At X0 and X1, a frequency up to 16 MHz is possible.

Example of Using Opposite Phase Supply



5.6 Mode Pins (MD_x)

These pins should be connected directly to the power supply or ground pins. To prevent the device from entering test mode accidentally due to noise, minimize the lengths of the patterns between each mode pin and power supply pin or ground pin on the printed circuit board as possible and connect them with low impedance.

5.7 Notes on Operating in PLL Clock Mode

If the oscillator is disconnected or the clock input stops when the PLL clock is selected, the microcontroller may continue to operate at the free-running frequency of the self-oscillating circuit of the PLL. However, this self-running operation cannot be guaranteed.

5.8 Pull-up Control

The AC standard is not guaranteed in case a pull-up resistor is connected to the pin serving as an external bus pin.

5.9 Notes on PS Register

As the PS register is processed in advance by some instructions, when the debugger is being used, the exception handling may result in execution breaking in an interrupt handling routine or the displayed values of the flags in the PS register being updated.
As the microcontroller is designed to carry out reprocessing correctly upon returning from such an EIT event, the operation before and after the EIT always proceeds according to specification.

The following behavior may occur if any of the following occurs in the instruction immediately after a DIV0U/DIV0S instruction:

(a) a user interrupt or NMI is accepted;

(b) single-step execution is performed;

(c) execution breaks due to a data event or from the emulator menu.

1. D0 and D1 flags are updated in advance.
2. An EIT handling routine (user interrupt/NMI or emulator) is executed.
3. Upon returning from the EIT, the DIV0U/DIV0S instruction is executed and the D0 and D1 flags are updated to the same values as those in 1.

The following behavior occurs when an ORCCR, STILM, MOV Ri,PS instruction is executed to enable a user interrupt or NMI source while that interrupt is in the active state.

1. The PS register is updated in advance.
2. An EIT handling routine (user interrupt/NMI or emulator) is executed.
3. Upon returning from the EIT, the above instructions are executed and the PS register is updated to the same value as in 1.

6. Notes on Debugger

6.1 Execution of the RETI Command

If single-step execution is used in an environment where an interrupt occurs frequently, the corresponding interrupt handling routine will be executed repeatedly to the exclusion of other processing. This will prevent the main routine and the handlers for low priority level interrupts from being executed (For example, if the time-base timer interrupt is enabled, stepping over the RETI instruction will always break on the first line of the time-base timer interrupt handler).

Disable the corresponding interrupts when the corresponding interrupt handling routine no longer needs debugging.

6.2 Break Function

If the range of addresses that cause a hardware break (including event breaks) is set to the address of the current system stack pointer or to an area that contains the stack pointer, execution will break after each instruction regardless of whether the user program actually contains data access instructions.

To prevent this, do not set (word) access to the area containing the address of the system stack pointer as the target of the hardware break (including an event breaks).

6.3 Operand Break

It may cause malfunctions if a stack pointer exists in the area which is set as the DSU operand break. Do not set the access to the areas containing the address of system stack pointer as a target of data event break.

8. CPU and Control Unit

The FR family CPU is a high performance core that is designed based on the RISC architecture with advanced instructions for embedded applications.

8.1 Features

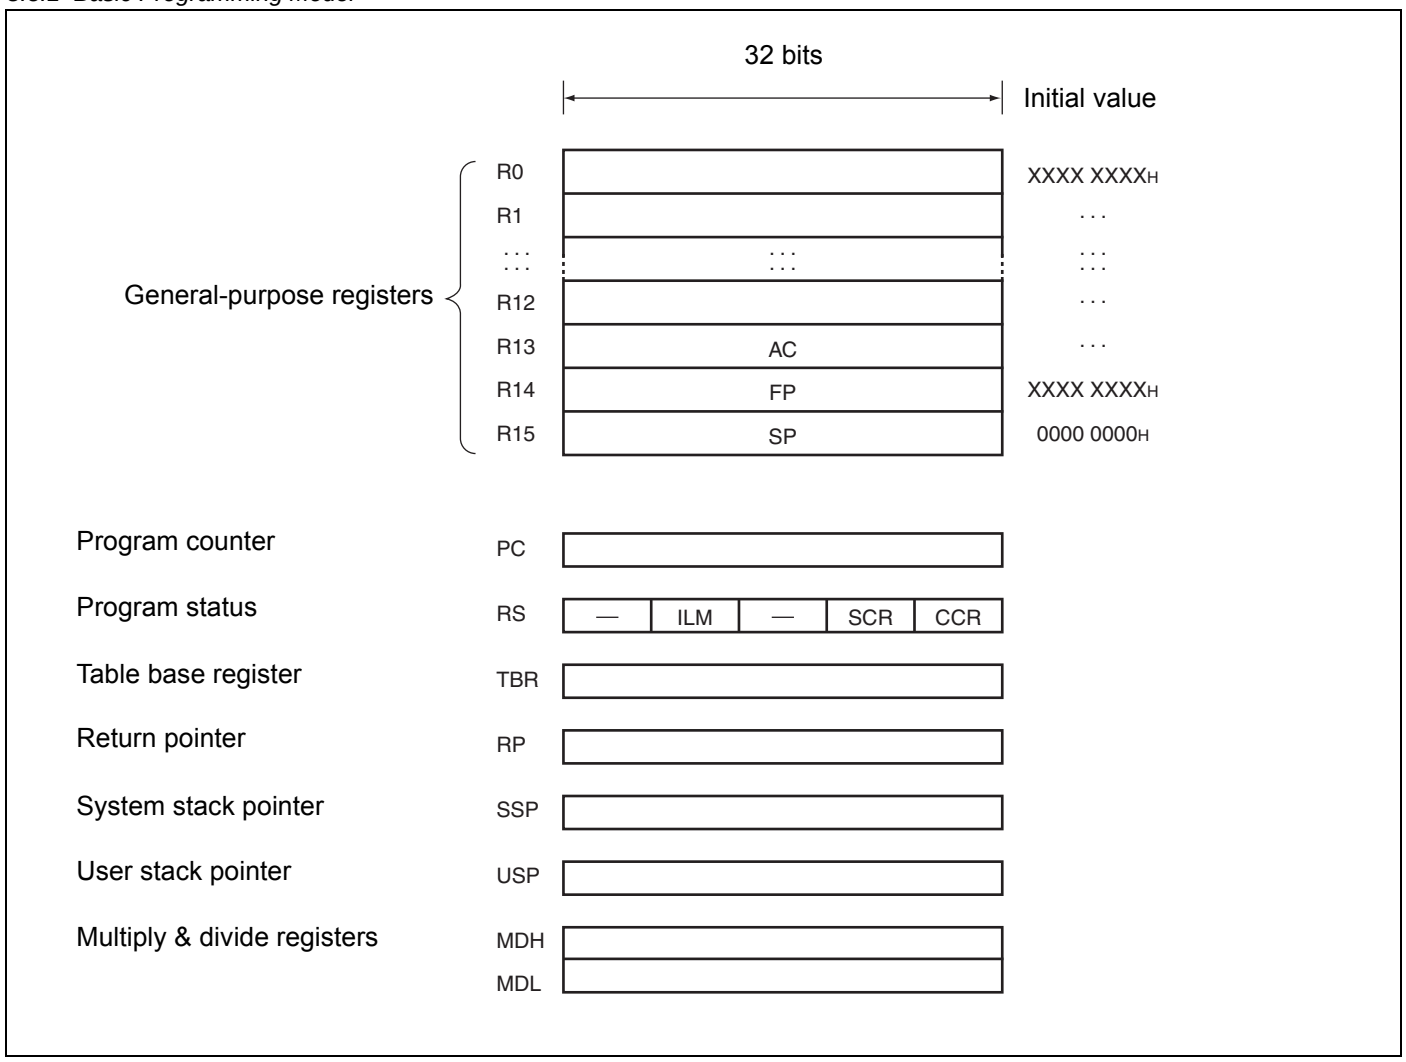
- Adoption of RISC architecture
  Basic instruction: 1 instruction per cycle
- General-purpose registers: 32-bit × 16 registers
- 4 Gbytes linear memory space
- Multiplier installed
  32-bit × 32-bit multiplication: 5 cycles
  16-bit × 16-bit multiplication: 3 cycles
- Enhanced interrupt processing function
  Quick response speed (6 cycles)
  Multiple-interrupt support
  Level mask function (16 levels)
- Enhanced instructions for I/O operation
  Memory-to-memory transfer instruction
  Bit processing instruction
  Basic instruction word length: 16 bits
- Low-power consumption
  Sleep mode/stop mode

8.2 Internal Architecture

- The FR family CPU uses the Harvard architecture in which the instruction bus and data bus are independent of each other.
- A 32-bit ↔ 16-bit buffer is connected to the 32-bit bus (D-bus) to provide an interface between the CPU and peripheral resources.
- A Harvard ↔ Princeton bus converter is connected to both the I-bus and D-bus to provide an interface between the CPU and the bus controller.

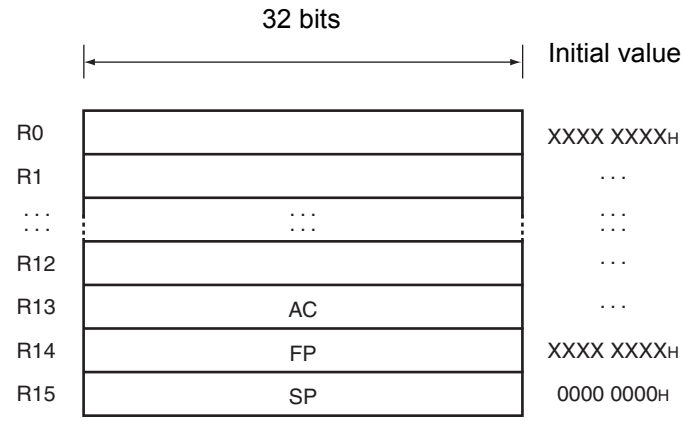
8.3 Programming Model

8.3.1 Basic Programming Model



8.4 Registers

8.4.1 General-purpose Register



Registers R0 to R15 are general-purpose registers. These registers can be used as accumulators for computation operations and as pointers for memory access.

Of the 16 registers, enhanced commands are provided for the following registers to enable their use for particular applications.

R13 : Virtual accumulator

R14 : Frame pointer

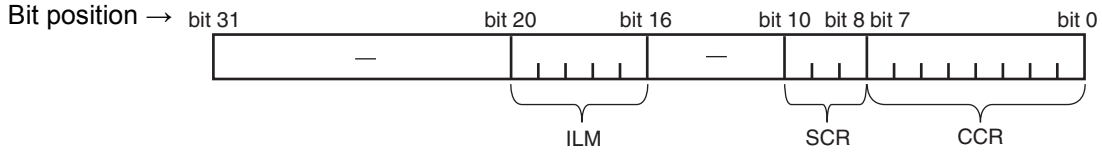
R15 : Stack pointer

Initial values at reset are undefined for R0 to R14. The value for R15 is 00000000_H (SSP value).

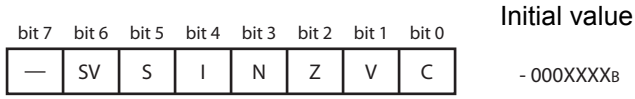
8.4.2 PS (Program Status)

This register holds the program status, and is divided into three parts, ILM, SCR, and CCR.

All undefined bits (-) in the diagram are reserved bits. The read values are always “0”. Write access to these bits is invalid.

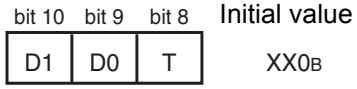


8.4.3 CCR (Condition Code Register)



SV : Supervisor flag
S : Stack flag
I : Interrupt enable flag
N : Negative enable flag
Z : Zero flag
V : Overflow flag
C : Carry flag

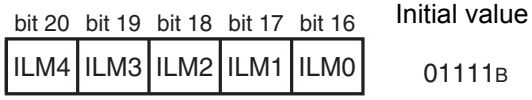
8.4.4 SCR (System Condition Register)



Flag for step division (D1, D0)
This flag stores interim data during execution of step division.

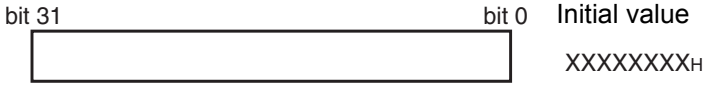
Step trace trap flag (T)
This flag indicates whether the step trace trap is enabled or disabled.
The step trace trap function is used by emulators. When an emulator is in use, it cannot be used in execution of user programs.

8.4.5 ILM (Interrupt Level Mask Register)



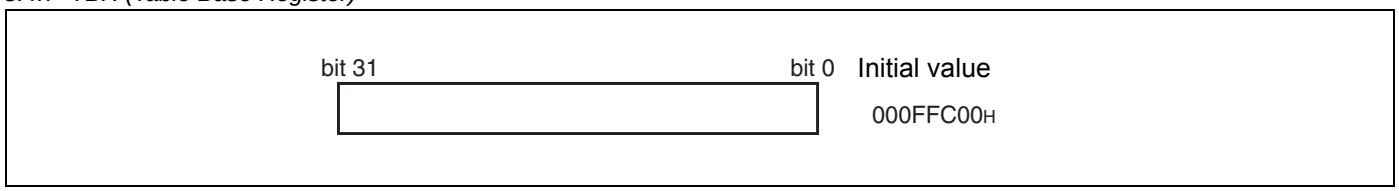
This register stores interrupt level mask values, and the values stored in ILM4 to ILM0 are used for level masking.
The register is initialized to value "01111_B" at reset.

8.4.6 PC (Program Counter)



The program counter indicates the address of the instruction that is being executed.
The initial value at reset is undefined.

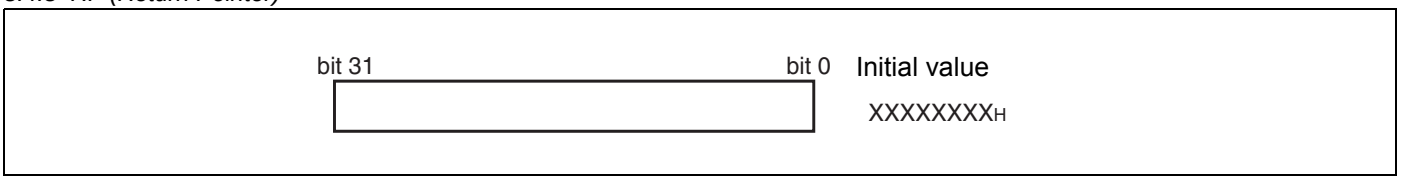
8.4.7 TBR (Table Base Register)



The table base register stores the starting address of the vector table used in EIT processing.

The initial value at reset is $000FFC00_H$.

8.4.8 RP (Return Pointer)



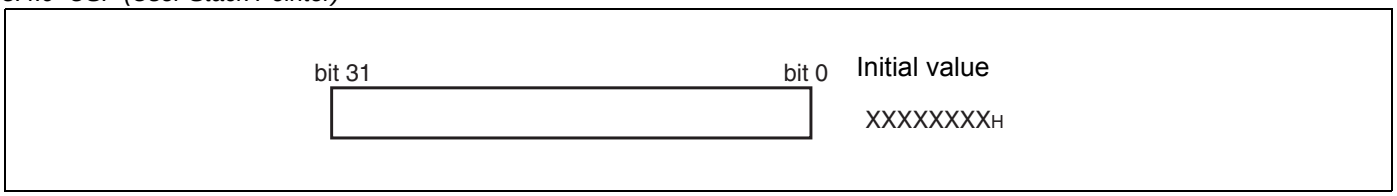
The return pointer stores the address for return from subroutines.

During execution of a CALL instruction, the PC value is transferred to this RP register.

During execution of a RET instruction, the contents of the RP register are transferred to PC.

The initial value at reset is undefined.

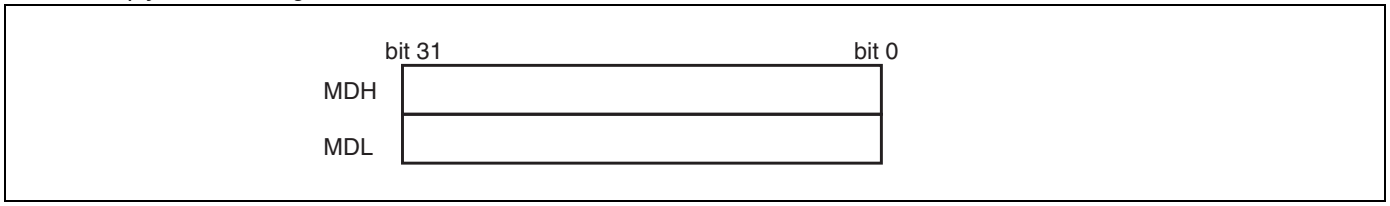
8.4.9 USP (User Stack Pointer)



The user stack pointer, when the S flag is “1”, this register functions as the R15 register.

- The USP register can also be explicitly specified.
  The initial value at reset is undefined.
- This register cannot be used with RETI instructions.

8.4.10 Multiply & Divide Registers



These registers are for multiplication and division, and are each 32 bits in length.

The initial value at reset is undefined.

9. Embedded Program/data Memory (Flash)

9.1 Flash Features

- CY91F467Dx: 1088 Kbytes (16 × 64 Kbytes ＋ 8 × 8 Kbytes) = 8.5 Mbits
- CY91F465DA: 544 Kbytes (8 × 64 Kbytes ＋ 4 × 8 Kbytes) = 4.25 Mbits
- Programmable wait state for read/write access
- Flash and Boot security with security vector at 0x0014:8000 - 0x0014:800F
- Boot security
- Basic specification: Same as CYM29LV400TC (except size and part of sector configuration)

9.2 Operation Modes

1. 64-bit CPU mode (available on CY91F467Dx only) :
   - CPU reads and executes programs in word (32-bit) length units.
   - Flash writing is not possible.
   - Actual Flash Memory access is performed in d-word (64-bit) length units.
2. 32-bit CPU mode :
   - CY91F465DA: CPU reads and executes programs in word (32-bit) length units.
     CY91F467Dx: CPU reads, writes and executes programs in word (32-bit) length units.
   - Actual Flash Memory access is performed in word (32-bit) length units.
3. 16-bit CPU mode :
   - CPU reads and writes in half-word (16-bit) length units.
   - Program execution from the Flash is not possible.
   - Actual Flash Memory access is performed in half-word (16-bit) length units.

Note: The operation mode of the flash memory can be selected using a Boot-ROM function. The function start address is 0xBF60. The parameter description is given in the Hardware Manual in chapter 54.6 “Flash Access Mode Switching”.

9.4.2 Pin Connections in Parallel Programming Mode

Resetting after setting the MD[2:0] pins to [111] will halt CPU functioning. At this time, the Flash memory's interface circuit enables direct control of the Flash memory unit from external pins by directly linking some of the signals to General Purpose Ports. Please see table below for signal mapping.

In this mode, the Flash memory appears to the external pins as a stand-alone unit. This mode is generally set when writing/erasing using the parallel Flash programmer. In this mode, all operations of the 8.5 Mbits Flash memory's Auto Algorithms are available.

9.5 Poweron Sequence in Parallel Programming Mode

The flash memory can be accessed in programming mode after a certain wait time, which is needed for Security Vector fetch:

- Minimum wait time after VDD5/VDD5R power on: 2.76 ms
- Minimum wait time after INITX rising: 1.0 ms

9.6 Flash Security

9.6.1 Vector Addresses

Two Flash Security Vectors (FSV1, FSV2) are located parallel to the Boot Security Vectors (BSV1, BSV2) controlling the protection functions of the Flash Security Module:

FSV1: 0x14:8000 BSV1: 0x14:8004
FSV2: 0x14:8008 BSV2: 0x14:800C

9.6.2 Security Vector FSV1

The setting of the Flash Security Vector FSV1 is responsible for the read and write protection modes and the individual write protection of the 8 Kbytes sectors.

FSV1 (bit31 to bit16)

The setting of the Flash Security Vector FSV1 bits [31:16] is responsible for the read and write protection modes.

Explanation of the bits in the Flash Security Vector FSV1 [31:16]

FSV1[31:19]	FSV1[18] Write Protection Level	FSV1[17] Write Protection	FSV1[16] Read Protection	Flash Security Mode
set all to “0”	set to “0”	set to “0”	set to “1”	Read Protection (all device modes, except INTVEC mode MD[2:0] = “000”)
set all to “0”	set to “0”	set to “1”	set to “0”	Write Protection (all device modes, without exception)

set all to “0”	set to “1”	set to “0”	set to “1”	Read Protection (all device modes, except INTVEC mode MD[2:0] = “000”)
set all to “0”	set to “1”	set to “1”	set to “0”	Write Protection (all device modes, except INTVEC mode MD[2:0] = “000”)
set all to “0”	set to “1”	set to “1”	set to “1”	Read Protection (all device modes, except INTVEC mode MD[2:0] = “000”) and Write Protection (all device modes except INTVEC mode MD[2:0] = “000”)

FSV1 (bit15 to bit0)

The setting of the Flash Security Vector FSV1 bits [15:0] is responsible for the individual write protection of the 8 Kbytes sectors. It is only evaluated if write protection bit FSV1[17] is set.

Explanation of the bits in the Flash Security Vector FSV1 [15:0]

FSV1 bit	Sector	Enable Write Protection	Disable Write Protection	Comment
FSV1[0]	SA0 (CY91F467Dx)	set to “0”	set to “1”

FSV1[2]	SA2 (CY91F467Dx)	set to “0”	set to “1”	
FSV1[3]	SA3 (CY91F467Dx)	set to “0”	set to “1”	
FSV1[4]	SA4	set to “0”	—	Write protection is mandatory!
FSV1[5]	SA5	set to “0”	set to “1”

FSV1[14]	—	set to “0”	set to “1”	not available
FSV1[15]	—	set to “0”	set to “1”	not available

Note : It is mandatory to always set the sector where the Flash Security Vectors FSV1 and FSV2 are located to write protected (here sector SA4). Otherwise it is possible to overwrite the Security Vector to a setting where it is possible to either read out the Flash content or manipulate data by writing.
See section “Flash access in CPU mode” for an overview about the sector organisation of the Flash Memory.

9.6.3 Security Vector FSV2

The setting of the Flash Security Vector FSV2 bits [31:0] is responsible for the individual write protection of the 64 Kbytes sectors. It is only evaluated if write protection bit FSV1 [17] is set.

Explanation of the bits in the Flash Security Vector FSV2[31:0]

FSV2 bit	Sector	Enable Write Protection	Disable Write Protection	Comment
FSV2[0]	SA8 (CY91F467Dx)	set to “0”	set to “1”

Note : See section “Flash access in CPU mode” for an overview about the sector organisation of the Flash Memory.

10. Memory Space

The FR family has 4 Gbytes of logical address space (2^{32} addresses) available to the CPU by linear access.

Direct Addressing Area

The following address space area is used for I/O.

This area is called direct addressing area, and the address of an operand can be specified directly in an instruction.

The size of directly addressable area depends on the length of the data being accessed as shown below.

Byte data access : 000_H to $0FF_H$

Half word access : 000_H to $1FF_H$

Word data access : 000_H to $3FF_H$

*1 : The Interrupt Control Registers (ICRs) are located in the interrupt controller and set the interrupt level for each interrupt request. An ICR is provided for each interrupt request.

*2 : The vector address for each EIT (exception, interrupt or trap) is calculated by adding the listed offset to the table base register value (TBR) . The TBR specifies the top of the EIT vector table. The addresses listed in the table are for the default TBR value ($000FFC00_H$) . The TBR is initialized to this value by a reset. The TBR is set to $000FFC00_H$ after the internal boot ROM is executed.

*3 : ICR23 and ICR47 can be exchanged by setting the REALOS compatibility bit (addr $0C03_H$: IOS[0])

*4 : Used by REALOS

*5 : Memory Protection Unit (MPU) support

14. Recommended Settings

14.1 PLL and Clockgear Settings

Please note that for CY91F467Dx the core base clock frequencies are valid in the 1.8V operation mode of the Main regulator and Flash.

14.2 Clock Modulator Settings

The following table shows all possible settings for the Clock Modulator in a base clock frequency range from 32MHz up to 88MHz.

The Flash access time settings need to be adjusted according to Fmax while the PLL and clockgear settings should be set according to base clock frequency.

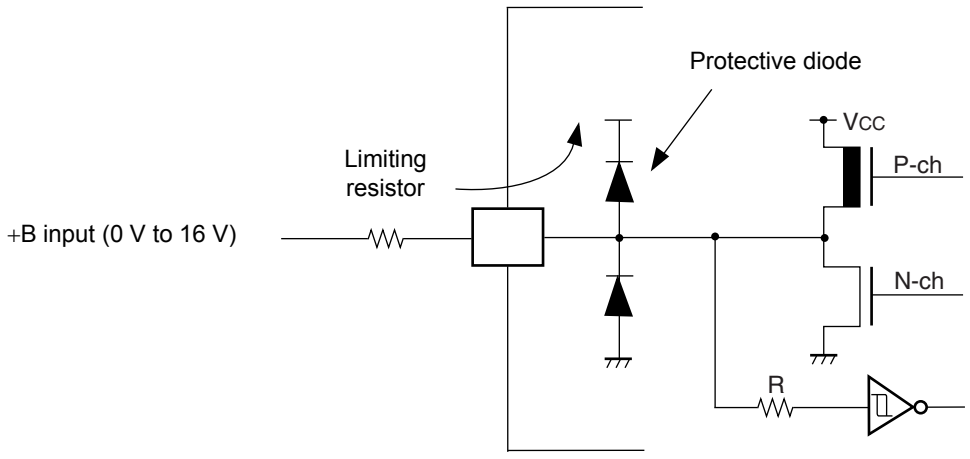
*1 : The parameter is based on $V_{SS}5 = HV_{SS}5 = AV_{SS}5 = 0.0$ V.

*2 : $AV_{CC}5$ and AVRH5 must not exceed $V_{DD}5 + 0.3$ V.

*3 :
- Use within recommended operating conditions.
- Use with DC voltage (current).
- +B signals are input signals that exceed the $V_{DD}5$ voltage. +B signals should always be applied by connecting a limiting resistor or between the +B signal and the microcontroller.
- The value of the limiting resistor should be set so that the current input to the microcontroller pin does not exceed the rated value at any time, either instantaneously or for an extended period, when the +B signal is input.
- Note that when the microcontroller drive current is low, such as in the low power consumption modes, the +B input potential can increase the potential at the power supply pin via a protective diode, possibly affecting other devices.
- Note that if the +B signal is input when the microcontroller is off (not fixed at 0 V), power is supplied through the +B input pin; therefore, the microcontroller may partially operate.
- Note that if the +B signal is input at power-on, since the power is supplied through the pin, the power-on reset may not function in the power supply voltage.
- Do not leave +B input pins open.
- Example of recommended circuit :

Input/output equivalent circuit



*4 : Maximum output current is defined as the value of the peak current flowing through any one of the corresponding pins.

*5 : Average output current is defined as the value of the average current flowing through any one of the corresponding pins for a 100 ms period.

*6 : Total average output current is defined as the value of the average current flowing through all of the corresponding pins for a 100 ms period.

WARNING: Semiconductor devices can be permanently damaged by application of stress (voltage, current, temperature, etc.) in excess of absolute maximum ratings. Do not exceed these ratings.

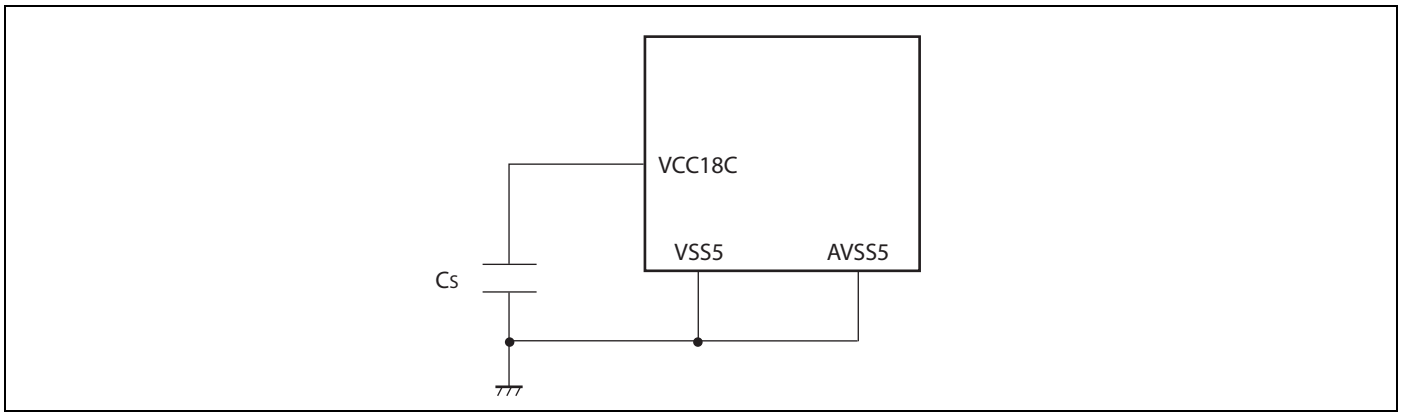
WARNING: The recommended operating conditions are required in order to ensure the normal operation of the semiconductor device. All of the device's electrical characteristics are warranted when the device is operated within these ranges.

Always use semiconductor devices within their recommended operating condition ranges. Operation outside these ranges may adversely affect reliability and could result in device failure.

No warranty is made with respect to uses, operating conditions, or combinations not represented on the data sheet. Users considering application outside the listed conditions are advised to contact their representatives beforehand.



15.3 DC Characteristics

Note: In the following tables, "V_{DD}" means $V_{DD}35$ for pins of ext. bus or $HV_{DD}5$ for SMC pins or $V_{DD}5$ for other pins.
In the following tables, "V_{SS}" means Hvss5 for ground Pins of the stepper motor and $V_{SS}5$ for the other pins.
($V_{DD}5 = AV_{CC}5 = 3.0$ V to 5.5 V, $V_{SS}5 = AV_{SS}5 = 0$ V, $T_A = -40°C$ to $+105°C$)

1. I2C Spec on CY91F467Dx only guaranteed for 4.5 V < $V_{DD}5$ < 5.5 V.
2. I2C Spec on CY91F467Dx only guaranteed for 4.5 V < $V_{DD}5$ < 5.5 V.
3. Pnn_m includes all GPIO pins. Analog (AN) channels and PullUp/PullDown are disabled.
4. ANn includes all pins where AN channels are enabled.
5. Pnn_m includes all GPIO pins. The pull up resistors must be enabled by PPER/PPCR setting and the pins must be in input direction.
6. Pnn_m includes all GPIO pins. The pull down resistors must be enabled by PPER/PPCR setting and the pins must be in input direction.
7. Main regulator OFF, sub regulator set to 1.2V, Low voltage detection disabled.
8. On CY91F467Dx, the I2C pin consumes typical 200 µA and maximal 400 µA when “L” level is output, even if there is no load condition. When entering the standby mode while I2C outputs “L”, the above-mentioned current is added to ICCH. The I2C pins are recommended to use for port input or external interrupt in standby mode.

$T_{samp} = (2.6\ kOhm + R_{EXT}) \times 11pF \times 7$; for $4.5V \le AV_{CC}5 \le 5.5V$

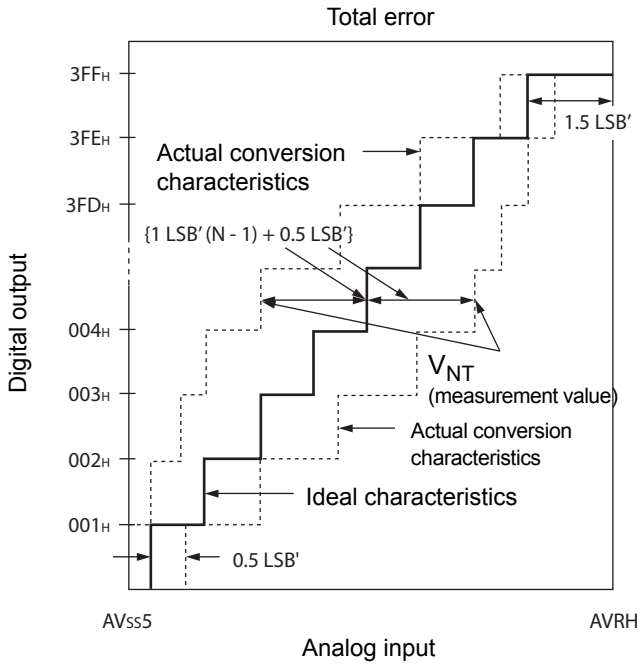
$T_{samp} = (12.1\ kOhm + R_{EXT}) \times 11pF \times 7$; for $3.0V \le AV_{CC}5 \le 4.5V$

Conversion Time Calculation

$T_{conv} = T_{samp} + T_{comp}$

Definition of A/D converter terms

- Resolution
  Analog variation that is recognizable by the A/D converter.
- Nonlinearity error
  Deviation between actual conversion characteristics and a straight line connecting the zero transition point ($00\ 0000\ 0000_B \leftrightarrow 00\ 0000\ 0001_B$) and the full scale transition point ($11\ 1111\ 1110_B \leftrightarrow 11\ 1111\ 1111_B$).
- Differential nonlinearity error
  Deviation of the input voltage from the ideal value that is required to change the output code by 1 LSB.
- Total error
  This error indicates the difference between actual and theoretical values, including the zero transition error, full scale transition error, and nonlinearity error.



$$1LSB' \text{ (ideal value)} = \frac{AVRH - AV_{SS}5}{1024} \text{ [V]}$$

$$\text{Total error of digital output N} = \frac{V_{NT} - \{1\ LSB' \times (N - 1) + 0.5\ LSB'\}}{1\ LSB'}$$

NOTES

1. ALL DIMENSIONS ARE IN MILLIMETERS.
2. DATUM PLANE H IS LOCATED AT THE BOTTOM OF THE MOLD PARTING LINE COINCIDENT WITH WHERE THE LEAD EXITS THE BODY.
3. DATUMS A-B AND D TO BE DETERMINED AT DATUM PLANE H.
4. TO BE DETERMINED AT SEATING PLANE C.
5. DIMENSIONS D1 AND E1 DO NOT INCLUDE MOLD PROTRUSION. ALLOWABLE PROTRUSION IS 0.25mm PRE SIDE. DIMENSIONS D1 AND E1 INCLUDE MOLD MISMATCH AND ARE DETERMINED AT DATUM PLANE H.
6. DETAILS OF PIN 1 IDENTIFIER ARE OPTIONAL BUT MUST BE LOCATED WITHIN THE ZONE INDICATED.
7. REGARDLESS OF THE RELATIVE SIZE OF THE UPPER AND LOWER BODY SECTIONS. DIMENSIONS D1 AND E1 ARE DETERMINED AT THE LARGEST FEATURE OF THE BODY EXCLUSIVE OF MOLD FLASH AND GATE BURRS. BUT INCLUDING ANY MISMATCH BETWEEN THE UPPER AND LOWER SECTIONS OF THE MOLDER BODY.
8. DIMENSION b DOES NOT INCLUDE DAMBAR PROTRUSION. THE DAMBAR PROTRUSION (S) SHALL NOT CAUSE THE LEAD WIDTH TO EXCEED b MAXIMUM BY MORE THAN 0.08mm. DAMBAR CANNOT BE LOCATED ON THE LOWER RADIUS OR THE LEAD FOOT.
9. THESE DIMENSIONS APPLY TO THE FLAT SECTION OF THE LEAD BETWEEN 0.10mm AND 0.25mm FROM THE LEAD TIP.
10. A1 IS DEFINED AS THE DISTANCE FROM THE SEATING PLANE TO THE LOWEST POINT OF THE PACKAGE BODY.

18. Revision History

Spansion Publication Number: DS07-16612-2E

Version	Date	Remark
2.0	2007-09-04	Initial version
2.1	2007-10-08	Revision history table added Fixed PDF generation problem before section “AD converter characteristics” Absolute maximum ratings: Smoothing capacitor size at VCC18C changed to “typ 4.7uF” Output voltage 2 is max. $V_{DD}35$ Recommended operating conditions: Power supply slew rate fixed Exchanged the sequence of device names into “MB91F465DA, MB91F467DA” where they appeare on one line
2.2	2007-10-16	Moved revision history to the end of file Features: Added Clock Monitor Corrected VCC18C pin number in table “Power supply/Ground pins” pg.14 Electrical characteristics: Added section 7.FLASH memory program/erase characteristics
2.3	2007-10-22	DC characterisitcs: Corrected $I_{CC}H$ in STOP + RTC 100kHz mode and I_{LV} (Icc of low volt detection) max. value
2.4	2007-10-25	FLASH memory program/erase characteristics: Typo fixed in note *1 Recommended operating conditions: Corrected text for smoothing capacitor at VCC18C pin Naming inconsistency AVSS / AVSS5 fixed Features: added Up/Down counter Product lineup: fixed number of interrupt channels Handling devices: changed the notes about external clock supply and removed section “Single phase clock supply” Clock timing: removed “Single phase clock supply” from freq. table
2.5	2008-1-11	DC characterisitcs: I_{IL} = +/- 3 uA at 105 deg.C IO CIRCUIT TYPE: Corrected oscillator pin block diagrams ELECTRICAL CHARACTERISTICS: re-arranged section sequence Fixed typos in ALARM comparator spec. Added MB91F467DB (called F467Dx if the text item is for bot revisions) Corrected IO-MAP according to latest proofread on F460G series Various corrections after proofread by FJ
2.6	2008-02-04	Added MEMO and DISCLAIMER
2.7	2008-02-18	AC-Characteristics: Replaced “rising”/”falling” with arrow-up/arrow-down

Version	Date	Remark
2.8	2008-06-20	Corrected missing bullets on PDF pages 2+3 Pin Assignment, Block Diagram: Corrected naming and assignments of TTG inputs, SGO and DACKX0 Notes on PS register: Re-formatted for better understanding ADC Characteristics: Offset between ADC channels is max. 4 LSB DC Characteristics: Added I_{LVI} (I_{CC} of internal low voltage detection), renamed I_{LV} into I_{LVE} (for external low voltage detection) AC Characteristics for external bus: Added notes that the usage of external feedback MCLKO --> MCLKI is not recommended. Flash parallel programming mode: Added notes about the pins to be set fix-0 / fix-1 (MD_2:0,...) Added section about the wait times after power on Flash operation modes: Added note about the BootROM fuction entry address for operation mode switch. Package Dimension: Updated package drawing All pages: Corrected typos and formatting bugs found by FJ proofread
2.9	2008-06-30	EMBEDDED PROGRAM/DATA MEMORY (FLASH): Corrected "The operation mode of the flash memory ..." instead of "of the MCU"
2.10	2008-08-04	Resources,Product lineup: Added Supply Supervisor (Low voltage detection) DC Characteristics: Updated pull-up/pull-down resistance values, updated and re-numbered the table footnotes
2.11	2008-08-18	Interrupt Vector Table: corrected the footnotes Flash Security: Corrected the sector assignments of FSV1/FSV2 bits Electrical Characteristics: removed the note that analog input/output pins cannot accept +B signal input. Ordering information: updated the part numbers All pages: Kilobytes are now written with "K"

NOTE: Please see “Document History” about later revised information.

Компания «Life Electronics» занимается поставками электронных компонентов импортного и отечественного производства от производителей и со складов крупных дистрибьюторов Европы, Америки и Азии.

С конца 2013 года компания активно расширяет линейку поставок компонентов по направлению коаксиальный кабель, кварцевые генераторы и конденсаторы (керамические, пленочные, электролитические), за счёт заключения дистрибьюторских договоров

Мы предлагаем:

- *Конкурентоспособные цены и скидки постоянным клиентам.*
- *Специальные условия для постоянных клиентов.*
- *Подбор аналогов.*
- *Поставку компонентов в любых объемах, удовлетворяющих вашим потребностям.*

- *Приемлемые сроки поставки, возможна ускоренная поставка.*
- *Доставку товара в любую точку России и стран СНГ.*
- *Комплексную поставку.*
- *Работу по проектам и поставку образцов.*
- *Формирование склада под заказчика.*

- *Сертификаты соответствия на поставляемую продукцию (по желанию клиента).*
- *Тестирование поставляемой продукции.*
- *Поставку компонентов, требующих военную и космическую приемку.*
- *Входной контроль качества.*
- *Наличие сертификата ISO.*

В составе нашей компании организован Конструкторский отдел, призванный помогать разработчикам, и инженерам.

Конструкторский отдел помогает осуществить:

- *Регистрацию проекта у производителя компонентов.*
- *Техническую поддержку проекта.*
- *Защиту от снятия компонента с производства.*
- *Оценку стоимости проекта по компонентам.*
- *Изготовление тестовой платы монтаж и пусконаладочные работы.*
