

General Description

The IDT8R9306I 2.5V differential clock buffer is a user-selectable differential input to six LVDS outputs. The fanout from a differential input to six LVDS outputs reduces loading on the preceding driver and provides an efficient clock distribution network. The IDT8R9306I can act as a translator from a differential HSTL, eHSTL, LVPECL (2.5V), LVPECL (3.3V), CML, or LVDS input to LVDS outputs. A single-ended 3.3V, 2.5V LVTTTL input can also be used to translate to LVDS outputs. The redundant input capability allows for an asynchronous change-over from a primary clock source to a secondary clock source. Selectable reference inputs are controlled by SEL.

The IDT8R9306I outputs can be asynchronously enabled/disabled. When disabled, the outputs will drive to the value selected by the GL pin. Multiple power and grounds reduce noise.

Applications

- Clock distribution

Features

- Guaranteed low skew: 40ps (maximum)
- Very low duty cycle distortion: <125ps (maximum)
- High speed propagation delay: <1.75ns (maximum)
- Up to 1GHz operation
- Selectable inputs
- Hot insertable and over-voltage tolerant inputs
- 3.3V/2.5V LVTTTL, HSTL eHSTL, LVPECL (2.5V), LVPECL (3.3V), CML or LVDS input interface
- Selectable differential inputs to six LVDS outputs
- Power-down mode
- 2.5V V_{DD}
- -40°C to 85°C ambient operating temperature
- Available in VFQFPN package

Pin Descriptions and Characteristics

Table 1. Pin Descriptions

Name	Type		Description
A[1:2]	Input	Adjustable ^(1, 4)	Clock input. A[1:2] is the "true" side of the differential clock input.
nA[1:2]	Input	Adjustable ^(1, 4)	Complementary clock inputs. nA[1:2] is the complementary side of A[1:2]. For LVTTTL single-ended operation, nA[1:2] should be set to the desired toggle voltage for A[1:2]: 3.3V LVTTTL VREF = 1650mV 2.5V LVTTTL VREF = 1250mV
nG	Input	LVTTTL	Gate control for differential outputs Q[1:6] and nQ[1:6]. When nG is LOW, the differential outputs are active. When nG is HIGH, the differential outputs are asynchronously driven to the level designated by GL ⁽²⁾ . See Table 3A.
GL	Input	LVTTTL	Specifies output disable level. If HIGH, "true" outputs disable HIGH and "complementary" outputs disable LOW. If LOW, "true" outputs disable LOW and "complementary" outputs disable HIGH. See Table 3A.
Q[1:6]	Output	LVDS	Clock outputs.
nQ[1:6]	Output	LVDS	Complementary clock outputs.
SEL	Input	LVTTTL	Reference clock select. When LOW, selects A2 and nA2. When HIGH, selects A1 and nA1. See Table 3B.
nPD	Input	LVTTTL	Power-down control. Shuts off entire chip. If LOW, the device goes into low power mode. Inputs and outputs are disabled. Both "true" and "complementary" outputs will pull to VDD. Set HIGH for normal operation. ⁽³⁾
V _{DD}		Power	Power supply for the device core and inputs.
GND		Power	Power supply return for all power.
nc			No connect; recommended to connect to GND.

NOTES:

- Inputs are capable of translating the following interface standards:
Single-ended 3.3V and 2.5V LVTTTL levels
Differential HSTL and eHSTL levels
Differential LVPECL (2.5V) and LVPECL (3.3V) levels
Differential LVDS levels
Differential CML levels
- Because the gate controls are asynchronous, runt pulses are possible. It is the user's responsibility to either time the gate control signals to minimize the possibility of runt pulses or be able to tolerate them in down stream circuitry.
- It is recommended that the outputs be disabled before entering power-down mode. It is also recommended that the outputs remain disabled until the device completes power-up after asserting nPD.
- The user must take precautions with any differential input interface standard being used in order to prevent instability when there is no input signal.

NOTE: Electrical parameters are guaranteed over the specified ambient operating temperature range, which is established when the device is mounted in a test socket with maintained transverse airflow greater than 500 lfm. The device will meet specifications after thermal equilibrium has been reached under these conditions.

NOTE 1: AC propagation measurements should not be taken within the first 100 cycles of startup.

NOTE 2: Skew measured between crosspoints of all differential output pairs under identical input and output interfaces, transitions and load conditions on any one device.

NOTE 3: Skew measured is the difference between propagation delay times t_{PHL} and t_{PLH} of any differential output pair under identical input and output interfaces, transitions and load conditions on any one device.

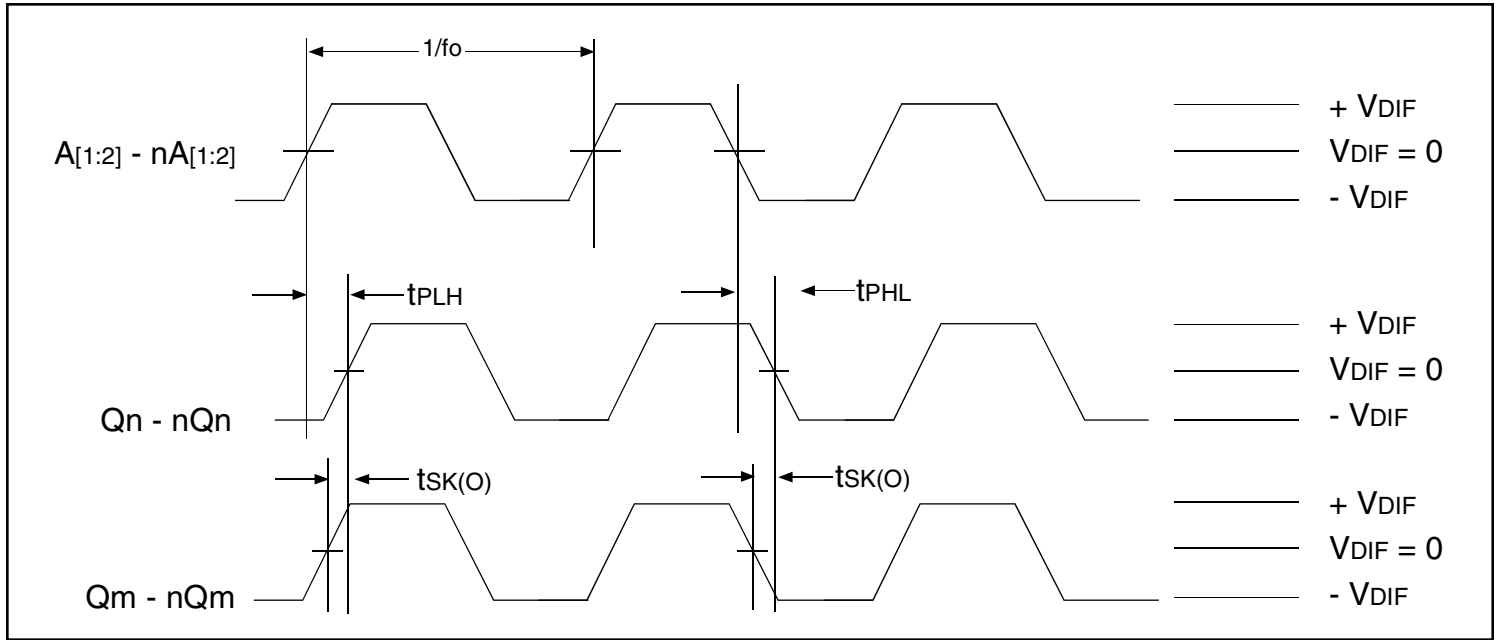

NOTE 4: Skew measured is the magnitude of the difference in propagation times between any single differential output pair of two devices, given identical transitions and load conditions at identical V_{DD} levels and temperature.

NOTE 5: All parameters are tested with a 50% input duty cycle.

NOTE 6: Guaranteed by design but not production tested.

Differential AC Timing Waveforms

Output Propagation and Skew Waveforms

NOTE 1: Pulse skew is calculated using the following expression:

$$t_{sk(p)} = |t_{p_{HL}} - t_{p_{LH}}|$$

Note that the $t_{p_{HL}}$ and $t_{p_{LH}}$ shown above are not valid measurements for this calculation because they are not taken from the same pulse.

NOTE 2: AC propagation measurements should not be taken within the first 100 cycles of startup.

Differential Gate Disabled/Enable Showing Runt Pulse Generation

NOTE 1: As shown, it is possible to generate runt pulses on gate disable and enable of the outputs. It is the user's responsibility to time the nG signal to avoid this problem.

Power Down Timing

NOTE 1: It is recommended that outputs be disabled before entering power-down mode. It is also recommended that the outputs remain disabled until the device completes power-up after asserting nPD.

NOTE 2: The *Power Down Timing* diagram assumes that GL is HIGH.

NOTE 3: It should be noted that during power-down mode, the outputs are both pulled to V_{DD} . In the *Power Down Timing* diagram this is shown when Qx, nQx goes to $V_{DIF} = 0$.

NOTE 1: Specifications only apply to “Normal Operations” test condition. The T_{IA}/E_{IA} specification load is for reference only.
 NOTE 2: The scope inputs are assumed to have a 2pF load to ground. $T_{IA}/E_{IA} - 644$ specifies 5pF between the output pair. With $C_L = 8pF$, this gives the test circuit appropriate 5pF equivalent load.

Applications Information

Recommendations for Unused Output Pins

Inputs:

LVC MOS Control Pins

The input controls must not be treated as unused inputs. All control pins are floating and have no default state. Each must be configured by tying a 1k Ω resistor to either ground or V_{DD} .

Clock Input

For applications not requiring the use of the second input clock Ax/nAx , it can be left floating. Though not required, but for additional protection, a 1k Ω resistor can be tied from Ax to ground and a 1k Ω resistor can be tied from nAx to V_{DD} .

Outputs:

LVDS Outputs

All unused LVDS output pairs can be either left floating or terminated with 100 Ω across. If they are left floating, we recommend that there is no trace attached.

VFQFPN EPAD Thermal Release Path

In order to maximize both the removal of heat from the package and the electrical performance, a land pattern must be incorporated on the Printed Circuit Board (PCB) within the footprint of the package corresponding to the exposed metal pad or exposed heat slug on the package, as shown in *Figure 1*. The solderable area on the PCB, as defined by the solder mask, should be at least the same size/shape as the exposed pad/slug area on the package to maximize the thermal/electrical performance. Sufficient clearance should be designed on the PCB between the outer edges of the land pattern and the inner edges of pad pattern for the leads to avoid any shorts.

While the land pattern on the PCB provides a means of heat transfer and electrical grounding from the package to the board through a solder joint, thermal vias are necessary to effectively conduct from the surface of the PCB to the ground plane(s). The land pattern must be connected to ground through these vias. The vias act as “heat pipes”. The number of vias (i.e. “heat pipes”) are application specific

and dependent upon the package power dissipation as well as electrical conductivity requirements. Thus, thermal and electrical analysis and/or testing are recommended to determine the minimum number needed. Maximum thermal and electrical performance is achieved when an array of vias is incorporated in the land pattern. It is recommended to use as many vias connected to ground as possible. It is also recommended that the via diameter should be 12 to 13mils (0.30 to 0.33mm) with 1oz copper via barrel plating. This is desirable to avoid any solder wicking inside the via during the soldering process which may result in voids in solder between the exposed pad/slug and the thermal land. Precautions should be taken to eliminate any solder voids between the exposed heat slug and the land pattern. Note: These recommendations are to be used as a guideline only.
