

**LTC3576EUFE-1**
**Switching Power Manager + USB On-the-Go  
 + OVP + HV Buck VC Control + 3 Bucks**
**DESCRIPTION**

Demonstration Circuit DC1577A is a Switching Power Manager with USB On-the-Go + Triple Step Down DC/DCs. The LTC3576EUFE-1 is available in a 38-pin (4mm × 6mm) QFN surface mount package.

LTC, LTM, LT, Burst Mode, OPTI-LOOP, Over-The-Top and PolyPhase are registered trademarks of Linear Technology Corporation. Adaptive Power, C-Load, DirectSense, Easy Drive, FilterCAD, Hot Swap, LinearView, µModule, Micropower SwitcherCAD, Multimode Dimming, No Latency  $\Delta\Sigma$ , No Latency Delta-Sigma, No R<sub>SENSE</sub>, Operational Filter, PanelProtect, PowerPath, PowerSOT, SmartStart, SoftSpan, Stage Shedding, SwitcherCAD, ThinSOT, UltraFast and VLDO are trademarks of Linear Technology Corporation. Other product names may be trademarks of the companies that manufacture the products.

**PERFORMANCE SUMMARY** Specifications are at T<sub>A</sub> = 25°C

SYMBOL	PARAMETER	CONDITIONS	MIN	TYP	MAX	UNITS
V <sub>USB</sub>	VUSB Input Voltage Range	Input disabled from 6V–30V	4.35		30	V
V <sub>OUT</sub>	V <sub>OUT</sub> Output Voltage Range	Range is mode and load dependant	3.5		5.5	V
V <sub>BAT</sub>	Output Float Voltage	Constant voltage mode		4.1		V
I <sub>BAT</sub>	Output Charge Current	Constant current mode		0.5	1	A

**SOFTWARE GUI**

The DC1577A Demo Circuit can be controlled from a software GUI. Most of the features of the LTC3576EUFE-1 are only accessible via the I<sup>2</sup>C channel. When the QuikEval program is active and a DC590 with a DC1577A connected and attached to the USB cable, the “LTC3576” form should automatically pop up and be fully operational:

Figure 1. GUI control panel

**SOFTWARE OPERATION**

The software GUI automatically opens the control panel shown above. This control panel allows control of most major functions of the LTC3576EUFE-1. The EN1, EN2, EN3, and ENOTG signals are wire OR’ed with individual regulator enable regulator signals from the I<sup>2</sup>C channel. Consequent to this, if the ENx or ENOTG signals are high, the regulators will be enabled regardless of the state of the I<sup>2</sup>C channel regulator control bits.

Register A, B, C and D display

These are not writeable and are provided as a programming aid. The current value of the I<sup>2</sup>C A, B, C and D registers are displayed.

Update button

Forces an immediate update of the I<sup>2</sup>C registers.

Autoupdate button

# LTC3576EUFE-1

If enabled (default) will update the I2C channel whenever something is changed.

## Battery charger button

If on (default) the battery charger in the LTC3576EUFE-1 will be enabled, and if off the battery charger will be disabled.

## VOUT1~VOUT3 buttons

Individually enable or disable the three voltage regulators. These only function if the ENx pins are held low.

## Switchmode Regulators mode

Set the mode of operation of all the switchmode regulators.

## VOUT1, VOUT2 and VOUT3 sliders

Allow control of voltage regulator 1, 2 and 3 output voltages by adjusting the respective reference DACs.

## VOUT1~3 output and reference voltages

These are not writeable, but reflect the current state of the reference DACs, and feedback resistors.

## Input current limit

Set the maximum power drawn from the USB port.

## Change feedback divider resistor values

This opens the form:

Figure 2. Feedback resistor control panel

This form allows the feedback resistor divider network on each regulator to be changed. The information changed here, is saved, and is durable from session to session. However, the factory values can be recovered by pressing the “Restore defaults” button

## QUICK START PROCEDURE

Using short twisted pair leads for any power connections, with all loads and power supplies off, refer to Figures 2 & 3 for the proper measurement and equipment setup.

A companion HV Buck demo board is required for this check out procedure. The DC1394 (LT3480) board is recommended, and will be used for the following procedure. Please refer to the DC1394 Quick Start Guide for further information.

Follow the procedure below:

1. Set “DVCC” jumper (JP9) to “MODE”, JP7 & JP8 to “0”. Do not start the GUI, at this time, as JP9 has disabled the I<sup>2</sup>C interface.
2. Set PS1 to 5V, and PS4 to 3.6V. Observe that  $3.55V < V_{OUT} (VM6) < 3.70V$  and  $80mA < I(V_{USB}) (AM1) < 95mA$ . The USB current limit is set for 1X (100mA), and the battery charger is set to 500mA. So, V<sub>OUT</sub> collapses until the charge current matches the current available from the USB input.
3. Set ILIM1 (JP2) and ILIM0 (JP1) to “1”. Observe that  $3.80 < V_{OUT} (VM4) < 4.10V$  and  $380mA < I(V_{USB}) < 420mA (AM1)$ . The USB input current limit is now 5X (500mA), and the V<sub>OUT</sub> switching regulator behaves like a transformer, exchanging output current for output voltage. So, the input current is  $\approx (V_{OUT}/V_{USB}) * 500mA$ . Set Load 1 to 0A.
4. Set ILIM1 (JP2) to “0” and ILIM0 (JP1) to “1”. Set Load 1 to 500mA. Observe  $4.00V < V_{OUT} < 4.15V (VM4)$  and  $760mA < I(V_{USB}) < 840mA (AM1)$ . The USB input current limit is now 10X (1A).
5. Set “DVCC” Jumper (JP9) to “DVCC”, JP7 and JP8 to “DC590”. Start the GUI
6. Set PS1 to 5V, and PS4 to 3.6V. . Observe that  $3.55V < V_{OUT} (VM6) < 3.70V$  and  $80mA < I(V_{USB}) (AM1) < 95mA$ . The USB current limit is set for 1X (100mA), and the battery charger is set to 500mA. So, V<sub>OUT</sub> collapses until the charge current matches the current available from the USB input.
7. Use GUI to set “Average input current limit setting” to “5X Mode (500mA). . Observe that  $3.55V < V_{OUT} (VM6) < 3.70V$  and  $80mA < I(V_{USB}) (AM1) < 95mA$ . The USB current limit is set for 1X (100mA), and the battery charger is set to 500mA. So, V<sub>OUT</sub> collapses until the charge current matches the current available from the USB input.
8. Use GUI to set “Average input current limit setting” to “10X Mode (1A). Set Load 1 to 500mA. Observe  $4.00V < V_{OUT} < 4.15V (VM4)$  and  $760mA < I(V_{USB}) < 840mA (AM1)$ . The USB input current limit is now 10X (1A).
9. Set PS1 to 0V, and Load 1 to 0A. Observe that  $3.50V < V_{OUT} 3.65V (VM6)$  and  $V(V_{OUT}, BAT) < 30mV (VM6 - VM7)$ . The ideal diode is now on, with a minimal load on V<sub>OUT</sub>.
10. Set Load 1 to 1A. Observe that  $3.50V < V_{OUT} (VM6) < 3.60V$  and  $V(V_{OUT},BAT) < 0.10V (VM6 - VM7)$ . Set Load 1 to 0A. The ideal diode is on and supplying the 1A Load 1 load from the battery.
11. Set NTC (JP4) to “EXT”. Does the “Battery Charging” LED blink? Set NTC (JP4) to “INT”.
12. Set WALL (DC1394, JP3) to “HVBUCK”, COMP (DC1394, JP2) to “REMOTE”, and SYNC (DC1394, JP1) to “RUN/SYNC”. Increase PS2 from 0V to 8V. Observe that  $3.80 V < V_{OUT} < 4.10V (VM6)$  and  $0.98V < V(PROG) < 1.02V (VM5)$ . The HV Buck regulator is now providing power to V<sub>OUT</sub>, and the internal regulator has stopped supplying power from the USB port.
13. Set Load 1 to 1A. Observe that  $3.80V < V_{OUT} < 4.10V (VM6)$  and  $0.98V < V (PROG) < 1.02V (VM5)$ .

# LTC3576EUFE-1

---

14. Set PS2 to 38V. Measure VOUT (VM6) and V (PROG) (VM5). Observe that  $3.80V < VOUT < 4.10V$  (VM6) and  $0.98V < V (PROG) < 1.02V$  (VM5).
15. Set WALL (DC1394, JP3) to “5V ADAPTOR” and PS3 to 5V. Observe that  $4.40V < VOUT < 5.40V$  (VM6) and  $0.98V < V (PROG) < 1.02V$  (VM5). The 5V adaptor is now providing the power VOUT. The voltage of PS3 will not track V (BAT) and the dissipation in the charger will increase.
16. Set Load 1 to 1A. Observe that  $4.40V < VOUT < 5.40V$  (VM6) and  $0.98V < V (PROG) < 1.02V$  (VM5). Set Load 1 to 0A and set Wall (DC1394, JP3) to “HVBUCK”.
17. Use GUI to enable VOUT1, VOUT2, and VOUT3. Observe that  $3.48V < VOUT1 < 3.70V$  (VM10),  $3.28V < VOUT2 < 3.49V$  (VM8), and  $1.74V < VOUT3 < 1.84V$  (VM9).
18. Set Load 2 to 400mA, Load 3 to 1A, and Load 4 to 400mA. Observe that  $3.48V < VOUT1 < 3.70V$  (VM10),  $3.28V < VOUT2 < 3.49V$  (VM8), and  $1.74V < VOUT3 < 1.84V$  (VM9).
19. Use GUI to set VOUT1, VOUT2, and VOUT3 to minimum. Observe that  $1.85V < VOUT1 < 1.96V$  (VM10),  $1.74V < VOUT2 < 1.85V$  (VM8), and  $0.93V < VOUT3 < 0.977V$  (VM9).
20. Set Load 2 to 0mA, Load 3 to 0mA, and Load 4 to 400mA. Observe that  $1.85V < VOUT1 < 1.96V$  (VM10),  $1.74V < VOUT2 < 1.85V$  (VM8), and  $0.93V < VOUT3 < 0.977V$  (VM9).
21. Use the GUI to disable VOUT1, VOUT2, and VOUT3. Observe that  $VOUT1 < 0.1V$  (VM10),  $VOUT2 < 0.1V$  (VM8), and  $VOUT3 < 0.1V$  (VM9).

Note: All connections from equipment should be Kelvin connected directly to the Board PINS which they are connected to on this diagram and any input, or output, leads should be twisted pair

Компания «Life Electronics» занимается поставками электронных компонентов импортного и отечественного производства от производителей и со складов крупных дистрибьюторов Европы, Америки и Азии.

С конца 2013 года компания активно расширяет линейку поставок компонентов по направлению коаксиальный кабель, кварцевые генераторы и конденсаторы (керамические, пленочные, электролитические), за счёт заключения дистрибьюторских договоров

Мы предлагаем:

- Конкуренеспособные цены и скидки постоянным клиентам.
- Специальные условия для постоянных клиентов.
- Подбор аналогов.
- Поставку компонентов в любых объемах, удовлетворяющих вашим потребностям.
- Приемлемые сроки поставки, возможна ускоренная поставка.
- Доставку товара в любую точку России и стран СНГ.
- Комплексную поставку.
- Работу по проектам и поставку образцов.
- Формирование склада под заказчика.
- Сертификаты соответствия на поставляемую продукцию (по желанию клиента).
- Тестирование поставляемой продукции.
- Поставку компонентов, требующих военную и космическую приемку.
- Входной контроль качества.
- Наличие сертификата ISO.

В составе нашей компании организован Конструкторский отдел, призванный помогать разработчикам, и инженерам.

Конструкторский отдел помогает осуществить:

- Регистрацию проекта у производителя компонентов.
- Техническую поддержку проекта.
- Защиту от снятия компонента с производства.
- Оценку стоимости проекта по компонентам.
- Изготовление тестовой платы монтаж и пусконаладочные работы.
