Description

The DHB34 Series of transient surge suppressors is comprised of two industrial high-energy Metal-Oxide Varistors (MOV) discs placed in parallel as a single device. They are designed to provide surge suppression in the AC mains outdoor and service entrance environment (distribution panels) of buildings. DHB34 applications also include industrial heavy motors, controls, and power supplies such as used in the oil-drilling, mining, and transportation fields, including HVAC and motor/generator applications.

The DHB34 Series provides rigid terminals for through-hole solder mounting on printed circuit boards, thereby eliminating the need for screw mounting.

Power Dissipation Ratings

Should transients occur in rapid succession, the average power 100 dissipation result is simply the energy (watt-seconds) per pulse times the number of pulses per second. The power so developed must be within the specifications shown on the Device Ratings and Specifications table for the specific device. The operating values must be derated as shown in above.

Peak Pulse Current Test Waveform

O_1 = Virtual Origin of Wave
 T = Time from 10% to 90% of Peak
 T_1 = Rise Time = $1.25 \times T$
 T_2 = Decay Time
Example - For an $8/20 \mu s$ Current Waveform:
 $8 \mu s = T_1$ = Rise Time
 $20 \mu s = T_2$ = Decay Time

Maximum Clamping Voltage

Repetitive Surge Capability

NOTE: If pulse ratings are exceeded, a shift of V_{NIDC} (at specified current) of more than $\pm 10\%$ could result. This type of shift, which normally results in a decrease of V_{NIDC} , may result in the device not meeting the original published specifications, but it does not prevent the device from continuing to function, and to provide ample protection.
