

EVB-USB5734
Evaluation Board
User's Guide

Note the following details of the code protection feature on Microchip devices:

- Microchip products meet the specification contained in their particular Microchip Data Sheet.
- Microchip believes that its family of products is one of the most secure families of its kind on the market today, when used in the intended manner and under normal conditions.
- There are dishonest and possibly illegal methods used to breach the code protection feature. All of these methods, to our knowledge, require using the Microchip products in a manner outside the operating specifications contained in Microchip's Data Sheets. Most likely, the person doing so is engaged in theft of intellectual property.
- Microchip is willing to work with the customer who is concerned about the integrity of their code.
- Neither Microchip nor any other semiconductor manufacturer can guarantee the security of their code. Code protection does not mean that we are guaranteeing the product as "unbreakable."

Code protection is constantly evolving. We at Microchip are committed to continuously improving the code protection features of our products. Attempts to break Microchip's code protection feature may be a violation of the Digital Millennium Copyright Act. If such acts allow unauthorized access to your software or other copyrighted work, you may have a right to sue for relief under that Act.

Information contained in this publication regarding device applications and the like is provided only for your convenience and may be superseded by updates. It is your responsibility to ensure that your application meets with your specifications. **MICROCHIP MAKES NO REPRESENTATIONS OR WARRANTIES OF ANY KIND WHETHER EXPRESS OR IMPLIED, WRITTEN OR ORAL, STATUTORY OR OTHERWISE, RELATED TO THE INFORMATION, INCLUDING BUT NOT LIMITED TO ITS CONDITION, QUALITY, PERFORMANCE, MERCHANTABILITY OR FITNESS FOR PURPOSE.** Microchip disclaims all liability arising from this information and its use. Use of Microchip devices in life support and/or safety applications is entirely at the buyer's risk, and the buyer agrees to defend, indemnify and hold harmless Microchip from any and all damages, claims, suits, or expenses resulting from such use. No licenses are conveyed, implicitly or otherwise, under any Microchip intellectual property rights.

Trademarks

QUALITY MANAGEMENT SYSTEM CERTIFIED BY DNV — ISO/TS 16949 —

Microchip received ISO/TS-16949:2009 certification for its worldwide headquarters, design and wafer fabrication facilities in Chandler and Tempe, Arizona; Gresham, Oregon and design centers in California and India. The Company's quality system processes and procedures are for its PIC® MCUs and dsPIC® DSCs, KEELOQ® code hopping devices, Serial EEPROMS, microperipherals, nonvolatile memory and analog products. In addition, Microchip's quality system for the design and manufacture of development systems is ISO 9001:2000 certified.

Object of Declaration: EVB-USB5734

EU Declaration of Conformity

This declaration of conformity is issued by the manufacturer.

The development/evaluation tool is designed to be used for research and development in a laboratory environment. This development/evaluation tool is not a Finished Appliance, nor is it intended for incorporation into Finished Appliances that are made commercially available as single functional units to end users under EU EMC Directive 2004/108/EC and as supported by the European Commission's Guide for the EMC Directive 2004/108/EC (8th February 2010).

This development/evaluation tool complies with EU RoHS2 Directive 2011/65/EU.

For information regarding the exclusive, limited warranties applicable to Microchip products, please see Microchip's standard terms and conditions of sale, which are printed on our sales documentation and available at www.microchip.com.

Preface

NOTICE TO CUSTOMERS

All documentation becomes dated, and this manual is no exception. Microchip tools and documentation are constantly evolving to meet customer needs, so some actual dialogs and/or tool descriptions may differ from those in this document. Please refer to our web site (www.microchip.com) to obtain the latest documentation available.

Documents are identified with a “DS” number. This number is located on the bottom of each page, in front of the page number. The numbering convention for the DS number is “DSXXXXXA”, where “XXXXX” is the document number and “A” is the revision level of the document.

For the most up-to-date information on development tools, see the MPLAB® IDE online help. Select the Help menu, and then Topics to open a list of available online help files.

INTRODUCTION

This chapter contains general information that will be useful to know before using the EVB-USB5734. Items discussed in this chapter include:

- Document Layout
- Conventions Used in this Guide
- The Microchip Web Site
- Development Systems Customer Change Notification Service
- Customer Support
- Document Revision History

DOCUMENT LAYOUT

This document describes how to use the EVB-USB5734 Evaluation Board as a development tool for the USB5734 4-port USB 3.0 hub with battery charging features.

- **Chapter 1. “Overview”** – Shows a brief description of the EVB-USB5734 Evaluation Board.
- **Chapter 2. “Board Details & Configuration”** – Includes instructions on how to get started with the EVB-USB5734 Evaluation Board.
- **Chapter 3. “Configuration IO Modes”** – Provides information about the five IO daughter cards provided with the EVB-USB5734 Evaluation Board.
- **Appendix A. “EVB-USB5734 Evaluation Board”** – This appendix shows the EVB-USB5734 Evaluation Board.
- **Appendix B. “EVB-USB5734 Schematics”** – This appendix shows the EVB-USB5734 Evaluation Board schematics.
- **Appendix C. “EVB-USB5734 BOM”** – This appendix includes the EVB-USB5734 Evaluation Board Bill of Materials (BOM).
- **Appendix D. “EVB-USB5734 Silk Screens”** – This appendix includes the EVB-USB5734 Evaluation Board silk screens.

CONVENTIONS USED IN THIS GUIDE

This manual uses the following documentation conventions:

DOCUMENTATION CONVENTIONS

Description	Represents	Examples
Arial font:		
Italic characters	Referenced books	MPLAB® IDE User's Guide
	Emphasized text	...is the <i>only</i> compiler...
Initial caps	A window	the Output window
	A dialog	the Settings dialog
	A menu selection	select Enable Programmer
Quotes	A field name in a window or dialog	"Save project before build"
Underlined, italic text with right angle bracket	A menu path	<u>File>Save</u>
Bold characters	A dialog button	Click OK
	A tab	Click the Power tab
N'Rnnnn	A number in verilog format, where N is the total number of digits, R is the radix and n is a digit.	4'b0010, 2'hF1
Text in angle brackets < >	A key on the keyboard	Press <Enter>, <F1>
Courier New font:		
Plain Courier New	Sample source code	#define START
	Filenames	autoexec.bat
	File paths	c:\mcc18\h
	Keywords	_asm, _endasm, static
	Command-line options	-Opa+, -Opa-
	Bit values	0, 1
	Constants	0xFF, 'A'
Italic Courier New	A variable argument	<i>file.o</i> , where <i>file</i> can be any valid filename
Square brackets []	Optional arguments	mcc18 [options] <i>file</i> [options]
Curly brackets and pipe character: { }	Choice of mutually exclusive arguments; an OR selection	errorlevel {0 1}
Ellipses...	Replaces repeated text	var_name [, var_name...]
	Represents code supplied by user	void main (void) { ... }

THE MICROCHIP WEB SITE

Microchip provides online support via our web site at www.microchip.com. This web site is used as a means to make files and information easily available to customers. Accessible by using your favorite Internet browser, the web site contains the following information:

- **Product Support** – Data sheets and errata, application notes and sample programs, design resources, user's guides and hardware support documents, latest software releases and archived software
- **General Technical Support** – Frequently Asked Questions (FAQs), technical support requests, online discussion groups, Microchip consultant program member listing
- **Business of Microchip** – Product selector and ordering guides, latest Microchip press releases, listing of seminars and events, listings of Microchip sales offices, distributors and factory representatives

DEVELOPMENT SYSTEMS CUSTOMER CHANGE NOTIFICATION SERVICE

Microchip's customer notification service helps keep customers current on Microchip products. Subscribers will receive e-mail notification whenever there are changes, updates, revisions or errata related to a specified product family or development tool of interest.

To register, access the Microchip web site at www.microchip.com, click on Customer Change Notification and follow the registration instructions.

The Development Systems product group categories are:

- **Compilers** – The latest information on Microchip C compilers, assemblers, linkers and other language tools. These include all MPLAB C compilers; all MPLAB assemblers (including MPASM assembler); all MPLAB linkers (including MPLINK object linker); and all MPLAB librarians (including MPLIB object librarian).
- **Emulators** – The latest information on Microchip in-circuit emulators. This includes the MPLAB REAL ICE and MPLAB ICE 2000 in-circuit emulators.
- **In-Circuit Debuggers** – The latest information on the Microchip in-circuit debuggers. This includes MPLAB ICD 3 in-circuit debuggers and PICkit 3 debug express.
- **MPLAB IDE** – The latest information on Microchip MPLAB IDE, the Windows Integrated Development Environment for development systems tools. This list is focused on the MPLAB IDE, MPLAB IDE Project Manager, MPLAB Editor and MPLAB SIM simulator, as well as general editing and debugging features.
- **Programmers** – The latest information on Microchip programmers. These include production programmers such as MPLAB REAL ICE in-circuit emulator, MPLAB ICD 3 in-circuit debugger and MPLAB PM3 device programmers. Also included are nonproduction development programmers such as PICSTART Plus and PIC-kit 2 and 3.

CUSTOMER SUPPORT

Users of Microchip products can receive assistance through several channels:

- Distributor or Representative
- Local Sales Office
- Field Application Engineer (FAE)
- Technical Support

Customers should contact their distributor, representative or field application engineer (FAE) for support. Local sales offices are also available to help customers. A listing of sales offices and locations is included in the back of this document.

Technical support is available through the web site at:
<http://www.microchip.com/support>

DOCUMENT REVISION HISTORY

Revision A (March 2015)

- Initial Release of this Document.

Revision B (June 2015)

- Update to text in **Section 1.3 “Terms and Abbreviations”**
- Update to text in **Section 2.1 “Power Source - Self-Powered”**
- Update to [Figure 2-3](#)
- Update to **Section 3.1.1 “Mode 1: Suspend Mode”**
- Update to [Figure 3-1](#)
- Update to **Section 3.1.2 “Mode 2: Flex Mode”**
- Update to [Figure 3-2](#)

Chapter 1. Overview

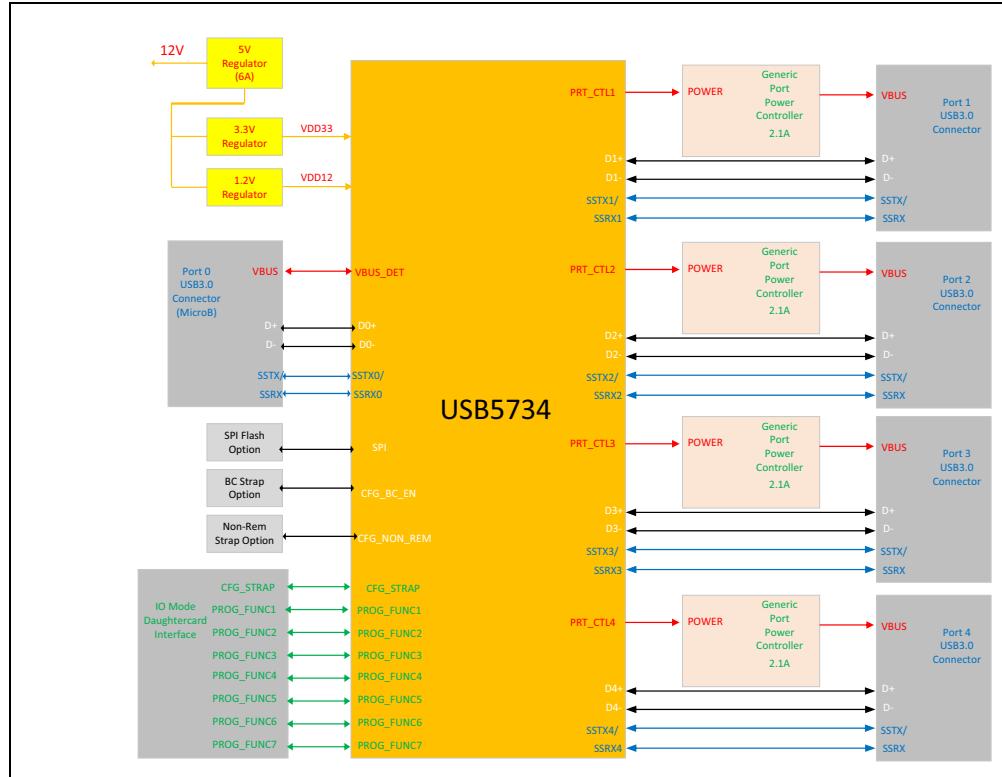

1.1 INTRODUCTION

The EVB-USB5734 Revision B is a demonstration and evaluation platform that provides the necessary requirements and interface options for evaluating the USB5734 Ultra Fast four port battery charging hub on a 4-layer RoHS-compliant Printed Circuit Board (PCB). This will allow the user to gain an understanding of the product and accelerate the integration of the EVB-USB5734 into the user's design. The EVB-USB5734 is compliant with the USB 3.0 USB Specification and supports Super-Speed (SS), High-Speed (HS), Full-Speed (FS), and Low-Speed (LS) USB signaling for complete coverage of all defined USB operation speeds. The evaluation platform supports four downstream ports that are USB 2.0 and USB 3.0 compliant. The EVB-USB5734 platform also supports battery charging on all four downstream ports (maximum of 5A total current at any one time). The EVB-USB5734 is configured for operation through internal default settings and supports custom configurations through SMBus or through the external 64-Mbit SPI Flash device, U8. The EVB-USB5734 demonstrates driver compatibility with Microsoft® Windows® 8x, Windows 7, Windows XP, Mac OS® X 10.4+, and Linux® hub drivers.

The EVB-USB5734 provides the following features:

- USB5734 in a 64-pin QFN RoHS compliant package
- USB 3.0 compliant (SS, HS, FS, and LS operation)
- USB pins are 5 V tolerant
- Four downstream USB 2.0/3.0 ports
- All downstream ports support individual port power and overcurrent sense
- All downstream ports are enabled for battery charging (2.1A max per port)
- Can support up to 5A total current downstream at any one time
- On-board SPI Flash for external downloadable firmware
- Low-cost 4-layer space saving design
- Operates from a single voltage (+12.0 V, regulated) external power supply
- On-board 25 MHz crystal
- Single on-board +5.25 V, 6 Amp regulator
- Single on-board +3.3 V, 0.5 Amp regulator
- Single on-board +1.2 V, 1 Amp regulator
- Port Power and Port Enable LED indicators
- LED indicators for SPI/Strap Configuration
- On-board IO connector for configurable Mode operations

FIGURE 1-1: EVB-USB5734 FUNCTIONAL BLOCK DIAGRAM

1.2 REFERENCES

Concepts and materials available in the following documents may be helpful when reading this document. Visit www.microchip.com for the latest documentation.

- USB5734 Datasheet
- EVB-USB5734 Schematics

1.3 TERMS AND ABBREVIATIONS

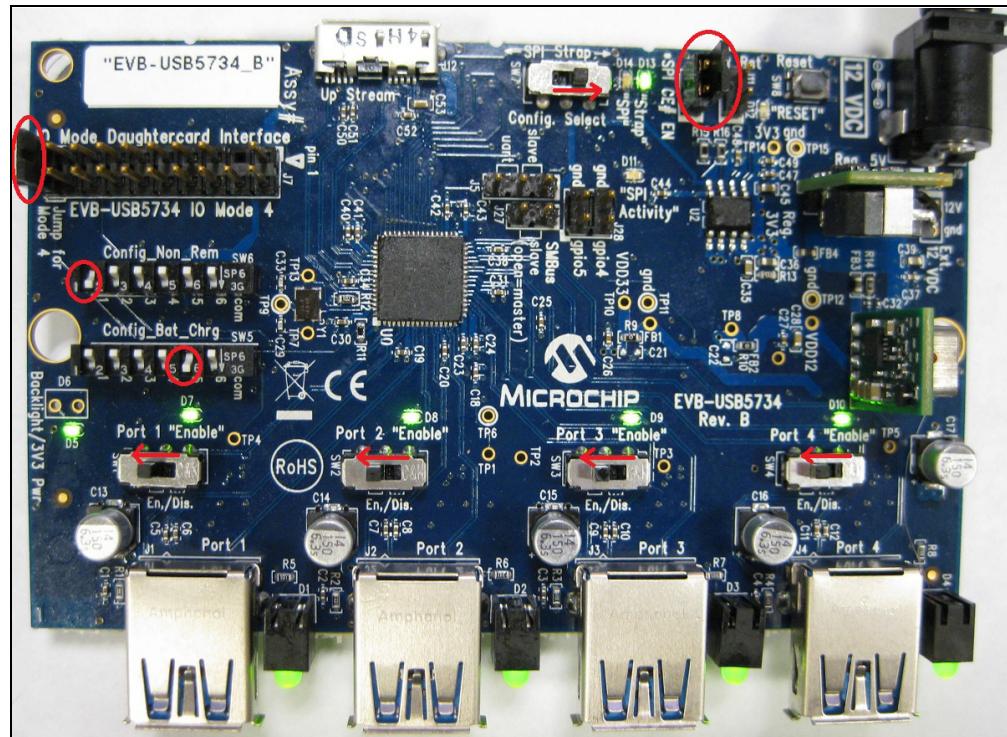

- **EVB** - Evaluation Board
- **SPI** - Serial Protocol Interface
- **CFG** - Configuration
- **BC** - Battery Charge
- **Non-Rem** - Non Removable
- **UART** - Universal Asynchronous Receiver/Transmitter
- **DUT** - Device Under Test
- **DFP** - Downstream Facing Port

Chapter 2. Board Details & Configuration

The Microchip EVB-USB5734 is designed for flexible configuration solutions. It can be configured via default internal register settings, downloadable external firmware to an on-board SPI Flash, through SMBus, or through the on-board configuration switches. When configured with the default internal register settings, the device operates as a USB 3.0/2.0 hub with four battery charge enabled USB ports and Microchip's standard VID/PID/DID settings.

This chapter describes details on the EVB-USB5734 Power, Clock and Configuration.

FIGURE 2-1: INITIAL CONFIGURATION

2.1 POWER SOURCE - SELF-POWERED

The EVB-USB5734 only supports self-powered operation, and is powered through one +12.0V regulated external power supply. The power supply plugs into the 2.5mm connector J9 on the board. Alternatively, an external voltage can be injected onto the J6 Ext. 12V header, which is not populated by default. The +12.0V feeds a 6A regulator which outputs +5.25V across the board. This +5.25V output supplies the +3.3V and +1.2V on-board regulators and VBUS for the DFPs.

FIGURE 2-2: EVB-USB5734 POWER SOURCE

2.2 DOWNSTREAM PORT POWER CONTROL

USB power to the four downstream ports are controlled via port power controllers with auto-discharge function. This provides up to 2.1A of USB battery charging power to each port, limited to a total of 5A at any one time.

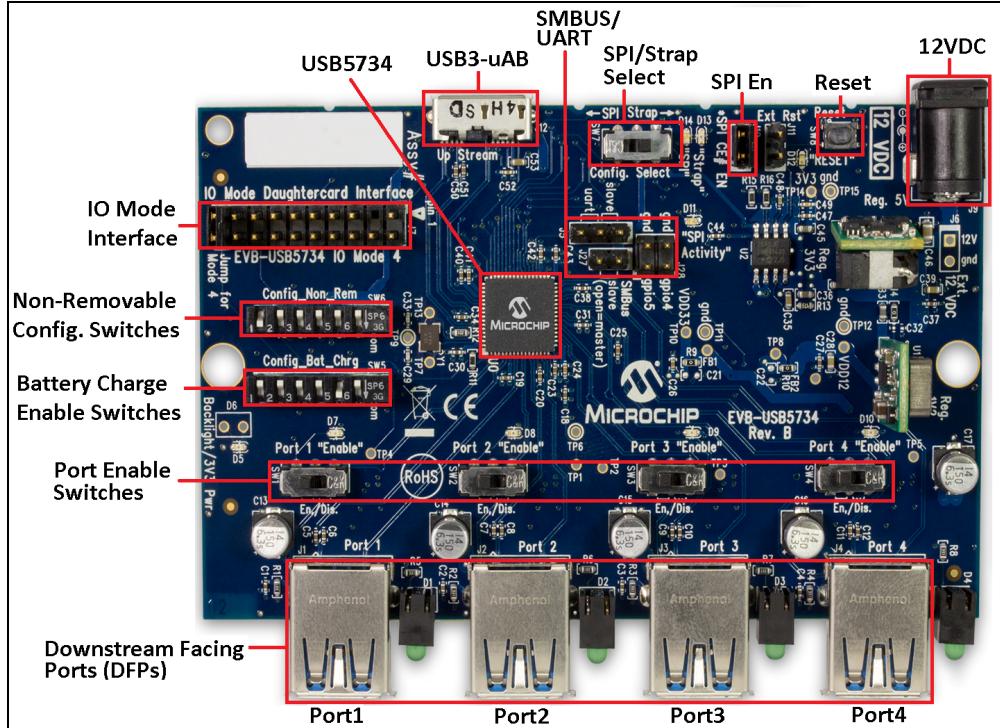

2.3 CLOCK

The EVB-USB5734 utilizes an external 25MHz 30ppm crystal to drive its internal oscillator circuit.

2.4 CONFIGURATION

The following sections describe the various board features and configuration settings. Figure 2-2 below shows a top view of the EVB-USB5734.

FIGURE 2-3: EVB-USB5734 TOP VIEW

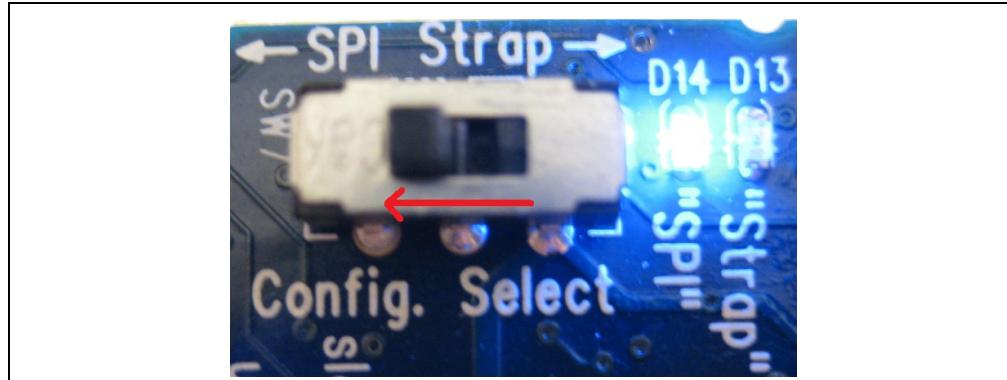

2.4.1 External SPI Flash

Upon power-up, the USB5734 first looks for an external SPI Flash device and a valid signature in the flash. If one is found, the external ROM is enabled and code execution is initiated from the external SPI device.

To select the SPI device, set the **Config. Select** switch (SW7) to the **SPI** position. The blue “**SPI**” LED will light. Note that the CFG_BC (Configuration Battery Charge) and CFG_Non-Rem (Configuration Non Removable) options are now de-selected. All configuration in SPI mode is done by the SPI.

Note: If the SPI Flash is not properly programmed or has an invalid signature, the USB5734 will default to internal defaults even if the SPI Flash is selected.

FIGURE 2-4: SPI SELECT

The pull-up resistors (R42 and R58) on the SPI device’s Write Protect (WPn) and Hold (HOLDn) pins must be populated in order to use external flash. The pull-up resistor (R61) on the SPI_CE_N pin of the USB5734 must also be populated in order to select 60MHz SPI operation, as opposed to 30MHz operation. Additionally there must be a jumper placed across the J10 **SPI CE# EN** header in order to enable the SPI device. The external flash can be programmed using the Microchip ProTouch2 MPT software tool which can be downloaded from the Microchip website at <http://www.microchip.com/ProTouch>.

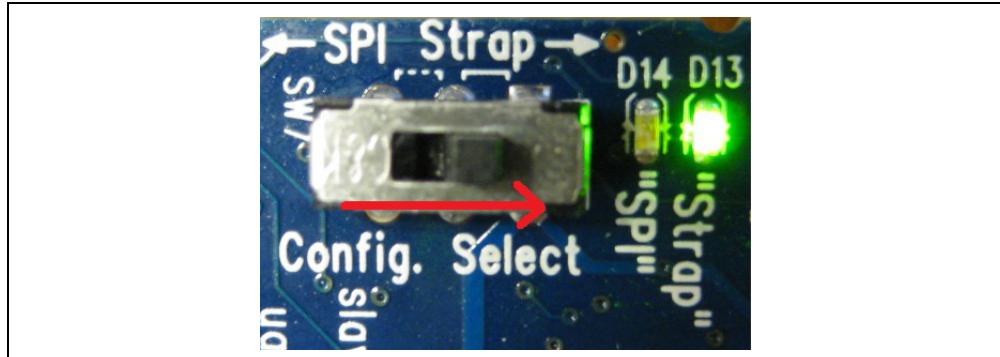

Note: Refer to the Protouch MPT User Manual on using this software to program the configuration.

2.4.2 SMBus

If a SPI Flash device is not found, the firmware checks if the SMBus is enabled. To select SMBus configuration, set the **Config. Select** switch to the **Strap** position. The green “**Strap**” LED will light.

The SMBus interface must have correct pull-up resistors applied by external circuitry to function properly. The USB5734 can operate in SMBus Slave or I2C Bridging mode. To operate in SMBus Slave mode, install a jumper across pins 1 and 2 of the J5 and J27 SMBus headers. These jumpers are required in order to enable SMBus communication. To operate in I2C Bridging mode instead, the J5 and J27 SMBus headers must be left open.

Note: If the USB5734 is configured for SMBus Slave operation, the DUT will wait indefinitely for data from the SMBus interface and will not enumerate until instructed by the SMBus interface.

FIGURE 2-5: SMBUS SELECT

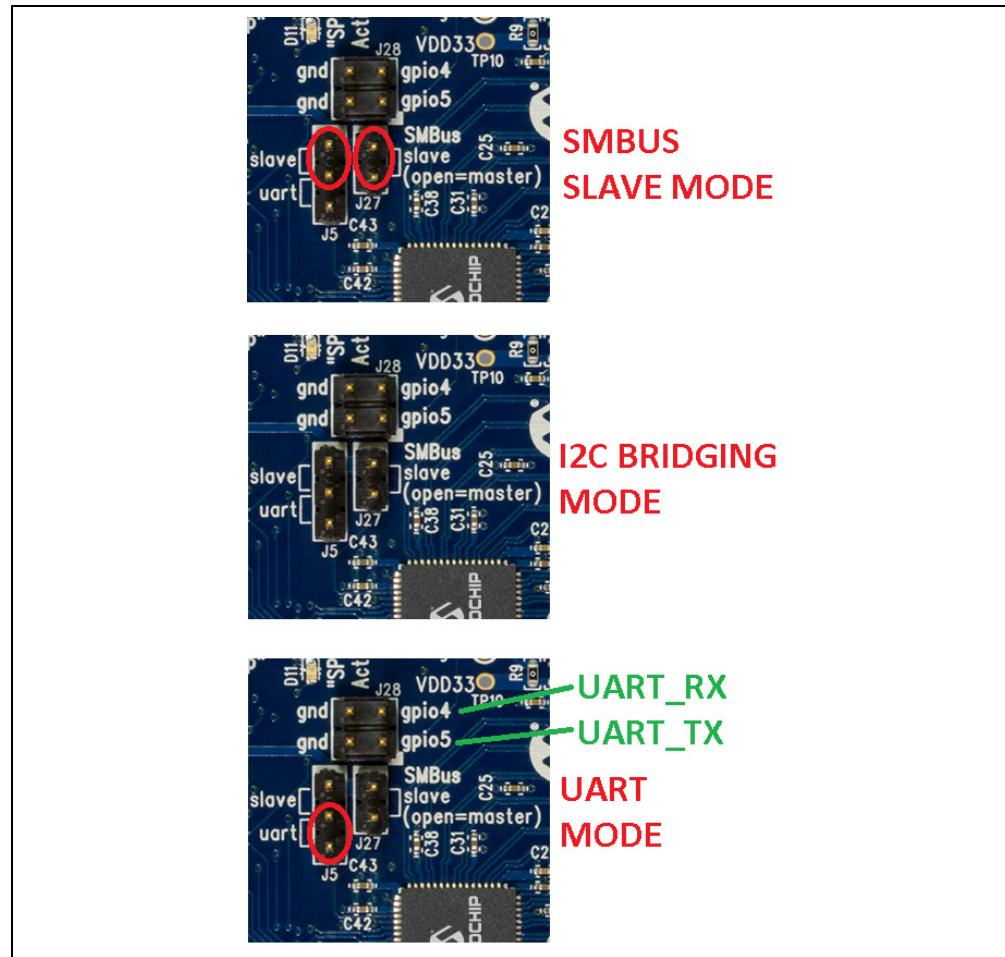

2.4.3 UART

The USB5734 provides a USB to UART bridge function that can be used in a simple two wire TX/RX mode or in a full modem signaling configuration (see Mode 6 section in Chapter 3). For simple two wire mode the J27 header must be left open and the J5 header must have a jumper installed across pins 2 and 3. This jumper is required in order to add a pull-down resistor on the UART_TX signal in order to enable the UART interface. Once in UART mode, the J28 UART header should be used for accessing the UART_RX and UART_TX signals on the USB5734. Note that UART can be enabled in configured IO Modes 1, 2, 3, 4, and 5. When IO Mode 6 is installed into the J7 IO connector (described more in section below), the J5 header does not require a jumper in order to configure the USB5734 for UART mode. The following table details the GPIO4/GPIO5 jumper options available to configure the USB5734 into different modes.

TABLE 2-1: SMBUS / UART SELECT

MODE	GPIO4 (J27)	GPIO5 (J5)	PU/PD STATUS
SMBUS Slave	short pins 1-2	short pins 1-2	GPIO4 = PU GPIO5 = PU
I2C Bridging	open	open	GPIO4 = open GPIO5 = open
UART	open	short pins 2-3	GPIO4 = open GPIO5 = PD

FIGURE 2-6: UART SELECT

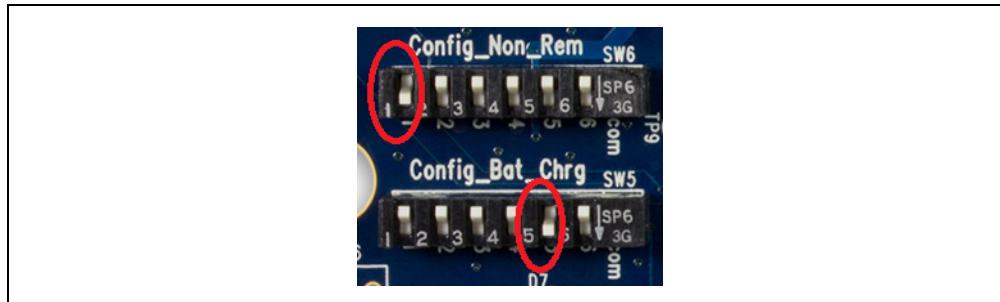

2.4.4 Configuration Source - Internal Default

When the USB5734 does not detect a valid SPI Flash image or SMBus configuration upon power-up, the EVB-USB5734 uses internal default register settings. It also sets the Vendor ID, Product ID, Language ID, and Device ID, and additional settings from internal ROM code.

2.4.5 Strapping Option

If configuration is not done through SPI, additional configuration is available through two functions: CFG_BC and CFG_Non-Rem. The controls are configured by selecting ONLY one of six resistor values for each pin. These are read by the USB5734 device and the BC and Non-Rem behavior of the downstream facing ports are determined.

To use the strapping option (which is the default configuration setup), set the **Config Select** switch (SW7) to the **Strap** position. The green “**Strap**” LED will light. Select the desired CFG_BC and CFG_Non-Rem options by enabling only one position for each of the **Config_Bat_Chrg Select** and **Config_Non_Rem Select** switches (SW5 and SW6). The default setup for SW5 is to slide pin 5 to the **com** side of the switch (towards the downstream facing ports) which configures all four downstream ports to be enabled for battery charging. The default setup for SW6 is to slide pin 1 to the **com** side of the switch (towards the downstream facing ports) which configures all four downstream ports to be removable.

FIGURE 2-7: STRAPPING OPTIONS**TABLE 2-2: STRAPPING OPTIONS FOR BATTERY CHARGING**

SW5 Position	Configuration
1	No Ports BC Enabled
2	Port 1 is BC Enabled
3	Port 1 & 2 are BC Enabled
4	Port 1, 2 & 3 are BC Enabled
5	Port 1, 2, 3 & 4 are BC Enabled [default]
6	Reserved

TABLE 2-3: STRAPPING OPTIONS FOR PORT REMOVABLE

SW6 Position	Configuration
1	All ports are Removable [default]
2	Port 1 is Non-Removable
3	Port 1 & 2 are Non-Removable
4	Port 1, 2 & 3 are Non-Removable
5	Port 1, 2, 3 & 4 are Non-Removable
6	Reserved

2.4.6 Port Power Options: Port Enable and Port Disable Select

Any downstream facing port on the EVB-USB5734 can be disabled if desired. When both DP & DM signals are pulled high to +3.3V, the USB5734 automatically disables the port, reports the corrected number of available ports to the host, and drives the PRT_CTRL line for the disabled port(s) low. By default, all four downstream facing ports are enabled.

To enable a port, use its **Port Enable** switch (SW1 - SW4) to select the **EN.** position. The associated “**Enable**” LED will light green.

To disable a port, slide its **Port Enable** switch (SW1 - SW4) to the **Dis.** position. The “**Enable**” LED will turn off.

The table below describes the port enable/disable strap options available for all four downstream ports on the USB5734.

TABLE 2-4: PORT ENABLE/DISABLE STRAP OPTIONS

Downstream Port	Associated Switch	Switch Position	LED
1	SW1	1-2, 4-5 = Port Enabled (Default)	D7 Green
		2-3, 5-6 = Port Disabled	D7 OFF
2	SW2	1-2, 4-5 = Port Enabled (Default)	D8 Green
		2-3, 5-6 = Port Disabled	D8 OFF

TABLE 2-4: PORT ENABLE/DISABLE STRAP OPTIONS (CONTINUED)

Downstream Port	Associated Switch	Switch Position	LED
3	SW3	1-2, 4-5 = Port Enabled (Default) 2-3, 5-6 = Port Disabled	D9 Green D9 OFF
4	SW4	1-2, 4-5 = Port Enabled (Default) 2-3, 5-6 = Port Disabled	D10 Green D10 OFF

Chapter 3. Configurable IO Modes

The Microchip EVB-USB5734 is designed for flexible configuration solutions. Five IO daughter cards are included in the EVB-USB5734 kit. Each IO daughter card has a 2x10 connector on the bottom side of the board that has pin 3 keyed and has pin 1 clearly marked with a triangle on the silkscreen. In order to use the desired IO daughter card, insert its keyed 2x10 header onto the keyed 2x10 IO connector J7 that is on the EVB-USB5734. The pin one triangle indicator on the EVB-USB5734 should line up with the pin one triangle indicator on the IO daughter card that is inserted. The sections below describe the mode functions of each IO daughter card.

Note: When configuring the USB5734 for IO Modes 1, 2, 3, 5, or 6, the jumper placed across pins 19 and 20 of the J7 IO connector must be removed from the EVB-USB5734. This jumper is only to be placed when configuring the USB5734 into IO Mode 4: Custom GPIO Mode.

3.1 CONFIGURATION IO DAUGHTER CARDS

The USB5734 can be configured for different IO modes depending on the pull-up or pull-down resistor chosen on the CFG_STRAP pin on the DUT. The table below shows the different resistor values required for the different IO mode settings. These resistor settings are populated by default on each IO daughter card.

TABLE 3-1: CONFIG STRAP RESISTOR SETTINGS

MODE	Configuration	SIGNAL	CFG_STRAP Resistor	PU/PD STATUS
1	Suspend Mode	C1_CONFIG	200kΩ	PD to GND
2	Flex Mode	C2_CONFIG	200kΩ	PU to 3V3
3	USB Speed LEDs Mode	C3_CONFIG	10kΩ	PD to GND
4	GPIO Mode (default)	CFG_STRAP	10kΩ	PU to 3V3
5	Battery Charging Mode	C5_CONFIG	10Ω	PD to GND
6	UART Mode	C6_CONFIG	10Ω	PU to 3V3

3.1.1 Mode 1: Suspend Mode

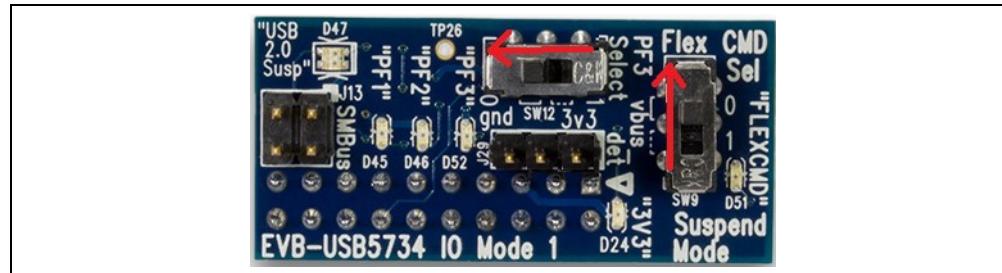

The Mode 1 IO daughter card configures the USB5734 into Suspend Indicator Mode. Once inserted onto the EVB-USB5734, the “3V3” Power LED should turn on green. An **SMBus** header J13 is provided as well for accessing the SMDAT and SMCLK signals of the USB5734 while in Suspend Mode. Additionally, the GPIO4/GPIO5 header J28 can be used in this mode to access the digital RX and TX UART signals. When accessing these signals, the J27 header must be left open and the J5 header must have a shunt placed across pins 2 and 3.

LED indicators “PF1” and “PF2” are provided for when accessing the PROG_FUNC1 and PROG_FUNC2 signals on the USB5734. When these function pins are driven high, their associated LED will turn on green. When these function pins are driven low, their associated LED will be OFF. The “PF3” LED is provided to indicate the state of

the **PF3 Select** switch (SW12) as described below. A “**USB 2.0 Susp**” LED is also provided to indicate when USB 2.0 on the USB5734 is in suspend or active mode. When in suspend mode, this LED will turn on yellow. When in active mode, this LED will turn on green.

There are two slide switches provided on this daughter card. The **PF3 Select** switch (SW12) allows the user to manually select whether PROG_FUNC3 will be driven high or low. The default position is to slide this switch into the **0** or Low position. With this switch in the low position, as mentioned above, the associated “**PF3**” LED will be OFF. When the **PF3 Select** switch is switched into the **1** or High position, the associated “**PF3**” LED will turn on green. The second slide switch is the **Flex_CMD Select** switch (SW9). This switch allows the user to manually set the USB5734 into Flex mode. The default setup is to slide the **Flex_CMD Select** switch into the **0** or Low position which will turn the “**FLEXCMD**” LED OFF. When the **Flex_CMD Select** switch is in the **1** or High position, the “**FLEXCMD**” LED will turn on orange and the “**USB 2.0 Susp**” LED will turn on yellow to indicate that the USB5734 is in Flex mode.

FIGURE 3-1: IO MODE 1 DAUGHTER CARD

3.1.2 Mode 2: Flex Mode

The Mode 2 IO daughter card configures the USB5734 into Flex Mode. Once inserted onto the EVB-USB5734, the “**3V3**” Power LED should turn on green. An **SMBus** header J16 is provided as well for accessing the SMDAT and SMCLK signals of the USB5734 while in Flex Mode. Additionally, the GPIO4/GPIO5 header J28 can be used in this mode to access the digital RX and TX UART signals. When accessing these signals, the J27 header must be left open and the J5 header must have a shunt placed across pins 2 and 3.

LEDs “**Port0**” and “**Port1**” are indicators for the USB Host bus speed. During Flex mode either Port 0 or Port 1 can be the USB host, and only the corresponding USB host LED will turn on. The LED color will indicate the USB host bus speed: yellow indicates USB 2.0 and blue indicates USB 3.0.

There is one slide switch provided on this daughter card. The **Flex_CMD Select** switch (SW11) allows the user to manually set the USB5734 into Flex mode. The default setup is to slide the **Flex_CMD Select** switch into the **0** or Low position which will turn the “**FLEXCMD**” and “**Flexed**” LEDs OFF. When the **Flex_CMD Select** switch is in the **1** or High position, the “**FLEXCMD**” and “**Flexed**” LEDs will turn on orange to indicate that the USB5734 is in Flex mode.

FIGURE 3-2: IO MODE 2 DAUGHTER CARD

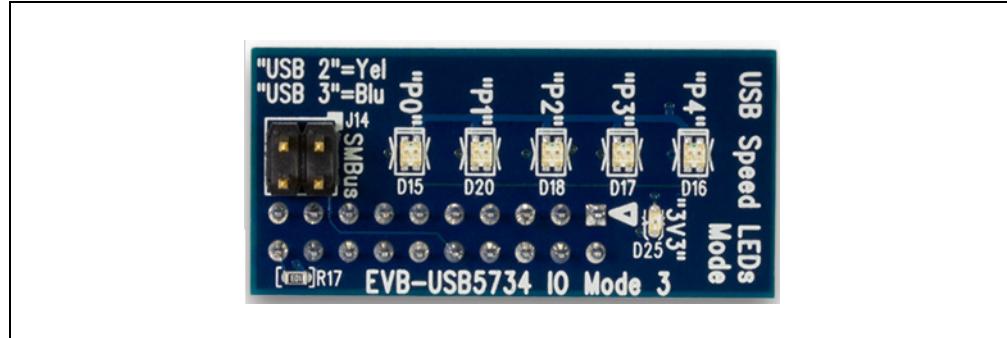

3.1.3 Mode 3: USB Speed LEDs Mode

The Mode 3 IO daughter card configures the USB5734 IO signals to indicate USB Speed status. Once inserted onto the EVB-USB5734, the “3V3” Power LED should turn on green. An **SMBus** header J14 is provided for accessing the SMDAT and SMCLK signals of the USB5734 while in USB Speed LEDs Mode. Additionally, the GPIO4/GPIO5 header J28 can be used in this mode to access the digital RX and TX UART signals. When accessing these signals, the J27 header must be left open and the J5 header must have a shunt placed across pins 2 and 3.

There are five speed LEDs on this daughter card that are labeled “P0” to “P4” which correspond to downstream Port 0 to Port 4. When a USB device is connected to a USB downstream port, the LED color will indicate the bus speed for the corresponding USB port: yellow indicates USB 2.0 and blue indicates USB 3.0. If there is no downstream device connected, the corresponding LED will be turned OFF.

FIGURE 3-3: IO MODE 3 DAUGHTER CARD

3.1.4 Mode 4: GPIO Mode

Mode 4 is the default IO configuration for the EVB-USB5734. There is no daughter card for Mode 4 operation. For the USB5734 to be set into GPIO Mode, a jumper needs to be placed across pins 19 and 20 on the 2x10 IO connector J7. When in GPIO mode, the programmable function pins of the USB5734 are set to TBD status. This mode is used for implementations that use the external SPI ROM and allows for custom configurations. The GPIO4/GPIO5 header J28 can be used in this mode to access the digital RX and TX UART signals. When accessing these signals, the J27 header must be left open and the J5 header must have a shunt placed across pins 2 and 3.

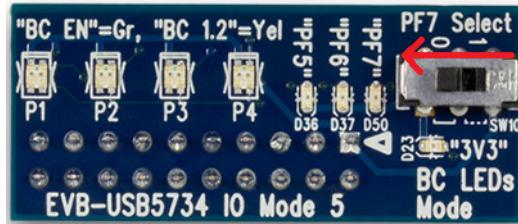

FIGURE 3-4: IO MODE 4 (NO DAUGHTER CARD)

3.1.5 Mode 5: Battery Charging LEDs Mode

The Mode 5 IO daughter card configures the USB5734 IO signals to indicate Battery status, with three IO signals configured as GPIO signals. Once inserted onto the EVB-USB5734, the “**3V3**” Power LED should turn on green. The GPIO4/GPIO5 header J28 can be used in this mode to access the digital RX and TX UART signals. When accessing these signals, the J27 header must be left open and the J5 header must have a shunt placed across pins 2 and 3.

There are seven LEDs on this daughter card. The first four LEDs labeled P1 to P4 indicate the battery charge status of Ports 1 through 4. The LEDs “**P1**” - “**P4**” will turn on green to indicate that battery charging is enabled on the corresponding USB port. If a battery charging device is connected to a BC enabled port and BC1.2 negotiation is successful, the corresponding LED will turn yellow. There are also three GPIO LEDs on this daughter card that are labeled “**PF5**” - “**PF7**”. LEDs “**PF5**” and “**PF6**” are indicators for when GPIO8 and GPIO10 are set as outputs using the USB to GPIO bridge function. When these pins are driven high, the associated “**PFx**” LED(s) will turn on green. When these pins are driven low, the associated “**PFx**” LED(s) will be OFF. The “**PF7**” LED is provided to indicate the state of the **PF7 Select** switch (SW10) as described below.

There is one slide switch on this daughter card. The **PF7 Select** switch (SW10) allows the user to manually select whether the PROG_FUNC7 pin should be driven high or low. The USB to GPIO bridge function is used to configure GPIO11 and sample the state of SW10. The default setup is to slide this switch into the **0** or Low position which will turn the “**PF7**” LED off. When the PF7 Select switch is in the **1** or High position, the “**PF7**” LED will turn on green.

FIGURE 3-5: IO MODE 5 DAUGHTER CARD

3.1.6 Mode 6: UART Mode

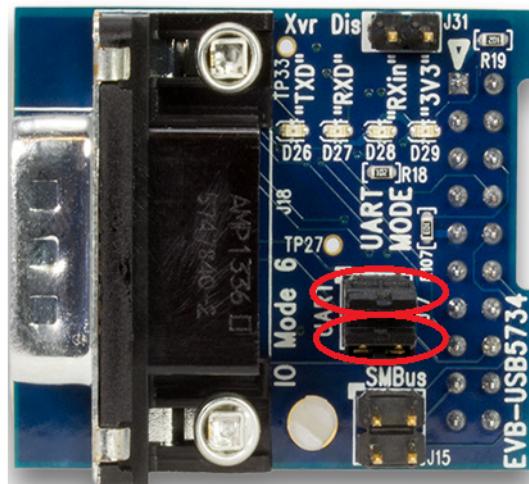

The Mode 6 IO daughter card configures the USB5734 into UART Mode. To insert this daughter card onto the EVB-USB5734, mate its 2x10 connector on the bottom side with the 2x10 IO connector on the EVB-USB5734, as done with the other IO cards. This daughter card has an additional standoff that inserts between the daughter card and the main EVB which provides extra support to the IO card.

Once inserted onto the EVB-USB5734, the “**3V3**” Power LED should turn on green. An **SMBus** header J15 is provided for accessing the SMDAT and SMCLK signals of the USB5734 while in UART Mode. There is a DTE serial connector on board (J18) which connects to a MAX3243 IC for RS232 communication. A 2x2 **UART** header J17 is provided so that the user can have the capability of using a straight cable or a simple null-modem cable. The default setup is to jumper pins 1-2 and 3-4 for a straight cable configuration. If a simple null-modem cable is used, then pins 1-3 and 2-4 should be shunted together on the J17 header. The “**TXD**” and “**RXD**” LEDs on this daughter card will turn on green to indicate activity on these signals.

There are two supported UART operations when using this IO card. The default operation is for normal flow control in which the user communicates through the DTE connector with the MAX3243 transceiver in circuit. In this configuration, the **Xvr Disable** header J31 header should be left open. The second option available is to have no flow control with the MAX3242 transceiver removed from the circuit. In this configuration, the **Xvr Disable** header J31 should have a jumper across pins 1-2 in order to disable the MAX3242. The UART signals can then be accessed via the **UART** header J28 on the EVB-USB5734. Also for this operation, there must be a jumper placed across pins 2 and 3 of the J5 header on the EVB-USB5734 and the J27 header must be left open.

Note: Use of this IO daughter card prevents the use of the on-board SPI and SMBus Slave.

ООО "ЛайфЭлектроникс"

"LifeElectronics" LLC

ИНН 7805602321 КПП 780501001 Р/С 40702810122510004610 ФАКБ "АБСОЛЮТ БАНК" (ЗАО) в г.Санкт-Петербурге К/С 30101810900000000703 БИК 044030703

Компания «Life Electronics» занимается поставками электронных компонентов импортного и отечественного производства от производителей и со складов крупных дистрибуторов Европы, Америки и Азии.

С конца 2013 года компания активно расширяет линейку поставок компонентов по направлению коаксиальный кабель, кварцевые генераторы и конденсаторы (керамические, пленочные, электролитические), за счёт заключения дистрибуторских договоров

Мы предлагаем:

- Конкурентоспособные цены и скидки постоянным клиентам.
- Специальные условия для постоянных клиентов.
- Подбор аналогов.
- Поставку компонентов в любых объемах, удовлетворяющих вашим потребностям.
- Приемлемые сроки поставки, возможна ускоренная поставка.
- Доставку товара в любую точку России и стран СНГ.
- Комплексную поставку.
- Работу по проектам и поставку образцов.
- Формирование склада под заказчика.
- Сертификаты соответствия на поставляемую продукцию (по желанию клиента).
- Тестирование поставляемой продукции.
- Поставку компонентов, требующих военную и космическую приемку.
- Входной контроль качества.
- Наличие сертификата ISO.

В составе нашей компании организован Конструкторский отдел, призванный помочь разработчикам, и инженерам.

Конструкторский отдел помогает осуществить:

- Регистрацию проекта у производителя компонентов.
- Техническую поддержку проекта.
- Защиту от снятия компонента с производства.
- Оценку стоимости проекта по компонентам.
- Изготовление тестовой платы монтаж и пусконаладочные работы.
