AS5132
8 BIT PROGRAMMABLE HIGH SPEED
MAGNETIC ROTARY ENCODER

AS5132-DB-1.0 Demoboard

OPERATION MANUAL

1 General Overview

The AS5132 is a contactless magnetic rotary encoder for accurate angular measurement over a full turn of 360º. It is a system-on-chip, combining integrated Hall elements, analog front end and digital signal processing in a single device.
To measure the angle, only a simple two-pole magnet, rotating over the center of the chip is required.
The absolute angle measurement provides instant indication of the magnet's angular position with a resolution of 8.5 bit = 360 positions per revolution. This digital data is available as a serial bit stream and as a PWM signal.
An additional U,V,W output can be used for a block commutation for a brushless DC motor. An incremental signal is available as an option.
In addition to the angle information, the strength if the magnetic field is also available as a 5-bit code.
A software programmable (OTP) zero position simplifies assembly as the zero position. The magnet does not need to be mechanically aligned.
To optimize the torque characteristic at a certain speed the AS5132 has the option to use a static or dynamic pre-commutation.

2 The AS5132 Demoboard

The AS5132 demoboard is a complete rotary encoder system with built-in microcontroller, USB interface, graphical LCD display, incremental indicators, commutation indicators and PWM output LED.
The board is USB powered or externally supplied with a 9V battery for standalone operation. For this Demoboard the AS5132 is configured with UVW Output.

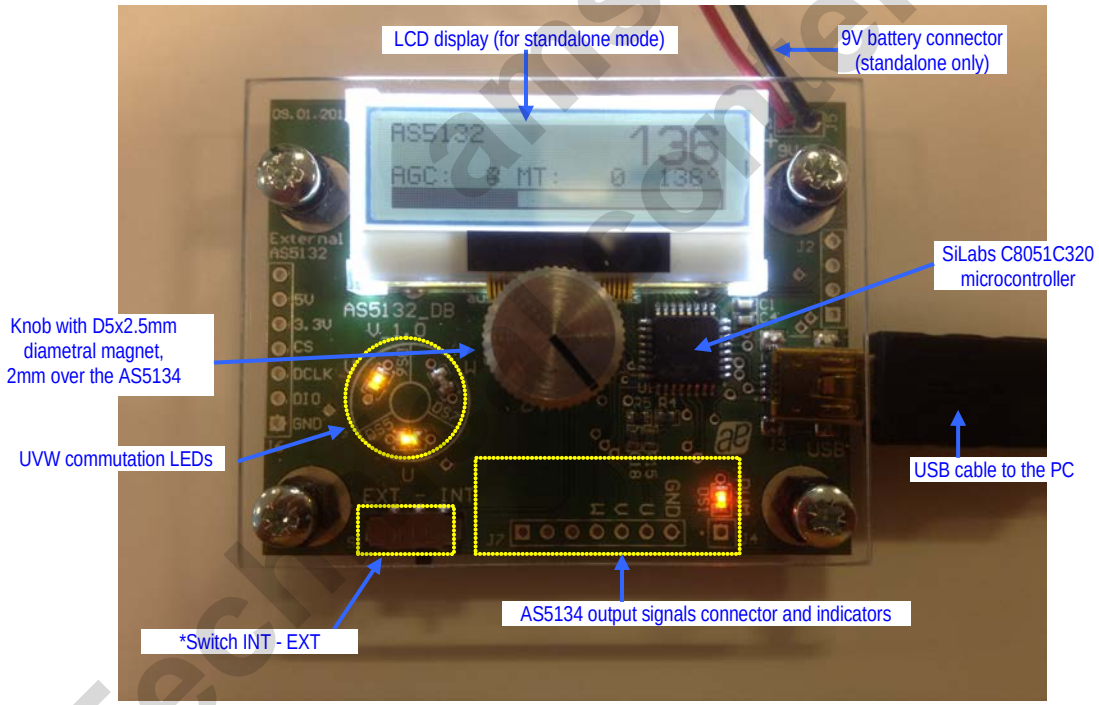

Figure 1: AS5132 Demoboard hardware with mounted magnet knob

3 Operating the AS5132 Demoboard

The AS5132 demoboard can be used in several ways:

- As standalone unit supplied by a 9V battery

Connect a 9V battery to the battery connector on the top right side of the board. No other connections are required.

- As standalone unit supplied by an USB port

Connect the demoboard to a PC using a USB/USB cable (included in demoboard shipment). The board is supplied by the 5V supply of the USB port. No other connections are required.

- As input device for the AS5000 Programmer GUI software

This configuration uses the same USB hardware connection as above, but additionally the AS5000 Programmer GUI software is running. The LCD display will be turned off and the Angle/Multiturn/AGC will be displayed on the PC screen. Some extra features as pole pair, zero position or AGC programming can be achieved. The parameters will not be permanently programmed. All the parameters will be lost when the demoboard is shut down Hardware Indicators

3.1.1 Graphic LCD display

The LCD display shows the realtime absolute angle position of the magnet as a 8.5bit digital word (0…360).
Turning the knob clockwise will increase the angle value until 359, then 0.
The Multiturn counter register will increment at each 359°→0° transition, and will decrease at each 0°→359° transition (counter clockwise). The Multiturn (MTURN) value is continuously read from the AS5132 Multiturn register.
The AGC value is continuously updated as well.

The magnet status indicator depends on the AGC value. If AGC = 0, the magnet it too close to the encoder. If AGC = 31, the magnet is too far away from the encoder (maximum AGC value).

Figure 2: LCD display in standalone mode (9V battery or USB powered without GUI)

3.1.2 PWM LED

This LED is connected to the PWM output of the AS5132. The PWM output is a pulse width that is proportional to the angle of the magnet.
The pulse width varies from 16µs to 734µs with a repetition rate of 1.33 kHz. Viewing the PWM signal on the LED results in a brightness that is proportional to the angle of the magnet. When the angle of the magnet is at 0°, the LED is almost dark, as it is 16µs on and 734µs off. Turning the knob clockwise towards higher angles increases the brightness of the PWM LED, since the ON-pulse becomes longer and the OFF-pulse becomes shorter.
Likewise, the PWM output can be used as an analog output proportional to the angle, when the PWM signal is filtered by a RC (or active) lowpass filter.
The PWM signal (0-5V) can be directly taken from the connector J4.

3.1.3 UVW commutation LED

The UVW commutation signals are used to control the electrical angle information of a BLDC motor (see AS5134 Datasheet Figure 10).
The UVW LEDs are directly connected to the U V W outputs of the AS5134. These UVW signals (0-5V) are available on connector J7.

4 AS5000 Programmer GUI software

4.1 Installing the GUI on the PC

The preliminary software is developed for a Microsoft Windows 7. For Microsoft Windows XP the dotnet (.NET) framework version 2.0 or more must be installed on the PC. This package can be downloaded free of charge from the Microsoft webpage:
http://www.microsoft.com/downloads/details.aspx?FamilyID=0856eacb-4362-4b0d-8edd-aab15c5e04f5&displaylang=en

Following Procedure is recommended before starting the GUI:

1. check on your PC if Service Pack 2 is installed (Only for
2. install the mentioned .NET package to your computer
3. execute setup.exe
4. Finally start the GUI using the shortcut in the start menu or desktop.

4.2 The Home tab

Figure 3 shows the main window of the GUI. On the top left corner, board informations as firmware (FW) version and demoboard name declaration can be found.
By default the GUI is in the auto detection mode. Any connected austriamicrosystems demoboard and programming tool will be automatically detected and displayed in the right top corner. The GUI is divided into three main sections HOME, TWI and OTP.

By selecting the TWI (AS5132 bidirectional serial protocol) tab, the information of the angular position and the status bits appears. See figure 4.

Figure 3: AS5000 GUI detected the AS5132 Demoboard

4.3 The TWI tab

This mode displays in realtime the angle value, Multiturn register value, AGC value and the UVW signal status.

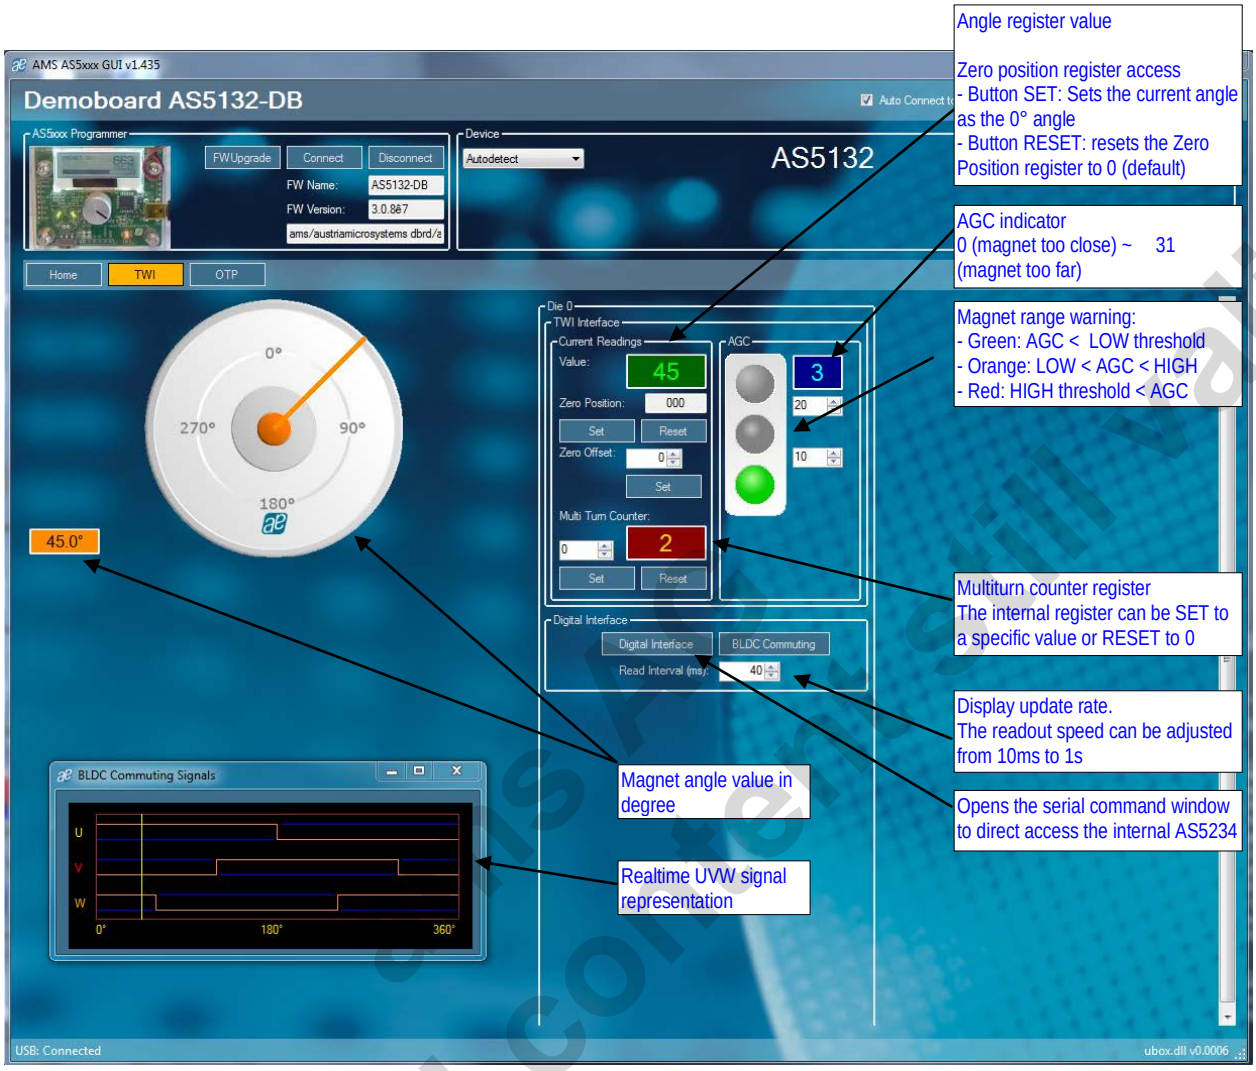

Figure 4: TWI tab, allows access to the AS5132 registers from the serial bus

Value is the Angle[8:0] from the RD_ANGLE (Read Angle) serial command. This value is continuously updated.

The **Zero Position** value represents the Zero Position register. By clicking on the Set button, the actual angle "Value" is written into the Zero Position register. Clicking on Reset writes the value 0 to the Zero Position register.

The Multiturn Counter field is the Multiturn-counter[8:0] register value from the READ_MT_COUNTER serial command. The Multiturn counter register can be set to a specific value by entering the turn number and clicking on Set. The counter can be reseted to 0 (default value) by clicking on Reset

The **AGC** value is continuously read from the RD_ANGLE serial command.
The range lamp can be set by two thresholds (Green→ Orange and Orange → Red) which are determined by the user. Those thresholds have no influence on the AS5132, it is a visual representation only.

The **Read Interval** can be modified from 10 ms (fastest) to 1 s (slowest).

The **BLDC Commuting Signals** sub-window is a realtime representation of the commutation signal status on the AS5132 UVW outputs. For changing the number of pole pairs, see chapter **Error! Reference source not found.**.

By clicking on Digital Interface, a new window opens, and allows the user to write directly into the AS5134 registers. See chapter 4.4.

4.4 Digital Interface sub-window

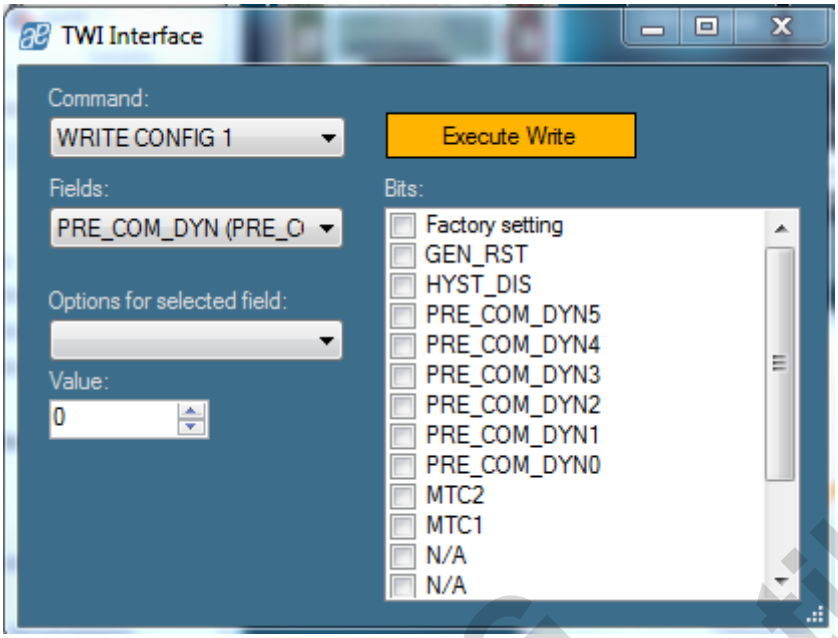

Figure 5: TWI interface sub-window

The Digital interface window allows accessing the internal registers of the AS5132:

Command Name	Command Data	Access Mode	MSB 15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	LSB 0
WRITE CONFIG	0001_0111	write		GEN RST	Hyst Dis	PRE_COM_DYN<5:0>						MTC2	MTC1					
SET MT COUNTER	0001_0100	write	MT - COUNTER <8:0>															
EN PROG	1000_0100	write	0	1	1	0	0	1	0	1	0	1	1	1	0	0	0	0
RD MT COUNTER	0000_0100	read	MT - COUNTER <8:0>									EZ ERR						P
RD_ANGLE	0000_0000	read	ANGLE <8:0>									LOCK ADC	AGC <5:1>					P

The parameters don't need to be checked manually in the "Bits" window on the right, but can be set by the "Fields" and "Options for the selected bits" values. The corresponding bits will be checked automatically.

PRE_COM_DYN: Absolute dynamic pre-commutation value. Depending on the setup of the pole pairs, a mechanical angle offset can be adjusted. The range is 0 to 63 mechanical degrees (LSBs)

To validate the command, the Execute Write button bust be clicked.

4.5 OTP tab

The OTP tab is normally used for the AS5000 programmer, but the OTP bits can be changed on the AS5132 demoboard as well.

Options like sensitivity, incremental output mode, UVW output mode can be changed by selecting the function in *"Fields"*, then changing the parameter in *"Options for the selected field"* or directly the decimal value of this parameter in *"Value"*.

Each time a field's value has been changed, the corresponding OTP bits will be automatically checked in the right window.
The button Write should be clicked to write the parameter into the AS5132.
The Read button reads back the OTP register, and updates the "Field" parameter as well as the OTP bits window.

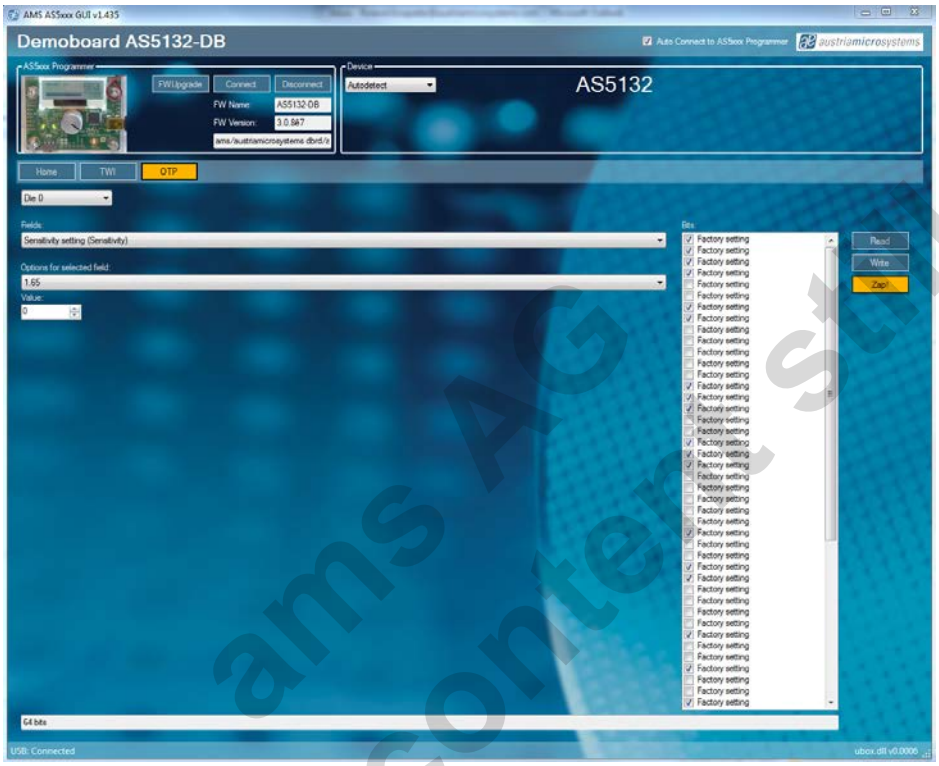

Figure 6: OTP tab

Field Sensitivity: Sets the gain of the internal signal path (typ).

- 0: Sensitivity = 1.65
- 1: Sensitivity = 1.88
- 2: Sensitivity = 2.11
- 3: Sensitivity = 2.35

PRE_COM_STAT: Set the static pre-commutation (mechanical Degrees)

- 0: 0°
- 1: 2°
- 2: 4°
- 3: 8°

Field UVW: To change the BLDC pole pairs. The result can be checked in realtime in the BLDC window. In the step mode configuration, the bit UVW<2> is used to invert the step mode output.

- 0: Sensitivity = 1 pole pair
- 1: Sensitivity = 2 pole pair
- 2: Sensitivity = 3 pole pair
- 3: Sensitivity = 4 pole pair
- 4: Sensitivity = 5 pole pair
- 5: Sensitivity = 6 pole pair
- 6: Sensitivity = 6 pole pair
- 7: Sensitivity = 6 pole pair

Field Zero Position: To zero position value, like on the TWI tab. The zero position value can be changed by checking the Z[0:8] bits, or changing the Value field with a decimal number.

Note that the Zap! button is used for the AS5000 Programmer only and has no effect on the AS5132 Demoboard.

ООО «ЛайфЭлектроникс» **“LifeElectronics” LLC**

ИНН 7805602321 КПП 780501001 Р/С 40702810122510004610 ФАКБ "АБСОЛЮТ БАНК" (ЗАО) в г.Санкт-Петербурге К/С 30101810900000000703 БИК 044030703

Компания «Life Electronics» занимается поставками электронных компонентов импортного и отечественного производства от производителей и со складов крупных дистрибьюторов Европы, Америки и Азии.

С конца 2013 года компания активно расширяет линейку поставок компонентов по направлению коаксиальный кабель, кварцевые генераторы и конденсаторы (керамические, пленочные, электролитические), за счёт заключения дистрибьюторских договоров

Мы предлагаем:

- *Конкурентоспособные цены и скидки постоянным клиентам.*
- *Специальные условия для постоянных клиентов.*
- *Подбор аналогов.*
- *Поставку компонентов в любых объемах, удовлетворяющих вашим потребностям.*

- *Приемлемые сроки поставки, возможна ускоренная поставка.*
- *Доставку товара в любую точку России и стран СНГ.*
- *Комплексную поставку.*
- *Работу по проектам и поставку образцов.*
- *Формирование склада под заказчика.*

- *Сертификаты соответствия на поставляемую продукцию (по желанию клиента).*
- *Тестирование поставляемой продукции.*
- *Поставку компонентов, требующих военную и космическую приемку.*
- *Входной контроль качества.*
- *Наличие сертификата ISO.*

В составе нашей компании организован Конструкторский отдел, призванный помогать разработчикам, и инженерам.

Конструкторский отдел помогает осуществить:

- *Регистрацию проекта у производителя компонентов.*
- *Техническую поддержку проекта.*
- *Защиту от снятия компонента с производства.*
- *Оценку стоимости проекта по компонентам.*
- *Изготовление тестовой платы монтаж и пусконаладочные работы.*
