Page	Subjects (major changes since last revision)
	This data sheet replaces the revision from 2007-05-31. The reason for the new revision is to increase the information content for the circuit designer. The performance parameters are now enlisted in a table containing many relevant application frequencies. The measurements of typical devices have been repeated and the device description has been expanded by adding several new characteristic curves. For customers who bought the product prior to the issue of the new revision the old specifications remain valid.

1 Product Brief

The BFP640F is linear very low noise wideband NPN bipolar RF transistor. The device is based on Infineon's reliable high volume silicon germanium carbon (SiGe:C) heterojunction bipolar technology. The collector design supports voltages up to $V_{CE} = 4.1$ V and currents up to $I_C = 50$ mA. With its high linearity at currents as low as 10 mA (see Fig. 5-8) the device supports energy efficient designs. The typical transition frequency is approximately 40 GHz, hence the device offers high power gain at frequencies up to 8 GHz in amplifier applications. The device is housed in a thin small flat plastic package with visible leads.

6 Simulation Data

For the SPICE Gummel Poon (GP) model as well as for the S-parameters (including noise parameters) please refer to our internet website. Please consult our website and download the latest versions before actually starting your design.

You find the BFP640F SPICE GP model in the internet in MWO- and ADS-format, which you can import into these circuit simulation tools very quickly and conveniently. The model already contains the package parasitics and is ready to use for DC and high frequency simulations. The terminals of the model circuit correspond to the pin configuration of the device.

The model parameters have been extracted and verified up to 6 GHz using typical devices. The BFP640F SPICE GP model reflects the typical DC- and RF-performance within the limitations which are given by the SPICE GP model itself. Besides the DC characteristics all S-parameters in magnitude and phase, as well as noise figure (including optimum source impedance, equivalent noise resistance and flicker noise) and intermodulation have been extracted.
