

FEATURES

- Stable in Gain $A_V \geq 2$ ($A_V = -1$)
- 200MHz Gain Bandwidth Product
- 30V/ μ s Slew Rate
- Settling Time: 800ns (150 μ V, 10V Step)
- Specified at $\pm 5V$ and $\pm 15V$ Supplies
- Maximum Input Offset Voltage: 125 μ V
- Low Distortion: -96.5 dB for 100kHz, 10V_{P-P}
- Maximum Input Offset Voltage Drift: 3 μ V/ $^{\circ}$ C
- Maximum Inverting Input Bias Current: 10nA
- Minimum DC Gain: 300V/mV
- Minimum Output Swing into 2k: $\pm 12.8V$
- Input Noise Voltage: 5nV/ \sqrt{Hz}
- Input Noise Current: 0.6pA/ \sqrt{Hz}
- Total Input Noise Optimized for $1k\Omega < R_S < 20k\Omega$
- Available in 8-Lead Plastic SO and 12-Lead (4mm \times 4mm) DFN Packages

APPLICATIONS

- Precision Instrumentation
- High Accuracy Data Acquisition Systems
- 16-Bit DAC Current-to-Voltage Converter
- ADC Buffer
- Low Distortion Active Filters
- Photodiode Amplifiers

DESCRIPTION

The LT[®]1469-2 is a dual, precision high speed operational amplifier with 16-bit accuracy, decompensated to be stable in a gain of 2 or greater. The combination of precision and AC performance makes the LT1469-2 the optimum choice for high accuracy applications such as DAC current-to-voltage conversion and ADC buffers. The initial accuracy and drift characteristics of the input offset voltage and inverting input bias current are tailored for inverting applications.

The 200MHz gain bandwidth ensures high open-loop gain at frequency for reducing distortion. In noninverting applications such as an ADC buffer, the low distortion and DC accuracy allow full 16-bit AC and DC performance. The high slew rate of the LT1469-2 improves large-signal performance in applications such as active filters and instrumentation amplifiers compared to other precision op amps.

The LT1469-2 is specified on power supply voltages of $\pm 5V$ and $\pm 15V$ and from $-40^{\circ}C$ to $85^{\circ}C$. It is available in an 8-lead SOIC package and a space saving 4mm \times 4mm leadless package. For a unity-gain stable op amp with same DC performance, see the LT1469 datasheet.

TYPICAL APPLICATION

16-Bit DAC I-to-V Converter

OFFSET: $V_{OS} + I_B (6k\Omega) < 1LSB$
 SETTLING TIME TO 150 μ V = 1.6 μ s
 SETTLING LIMITED BY 6k AND 20pF TO COMPENSATE DAC OUTPUT CAPACITANCE

14692 TA01a

Large-Signal Transient, $A_V = -1$

14692 TA02

LT1469-2

ELECTRICAL CHARACTERISTICS

Note 1: Stresses beyond those listed under Absolute Maximum Ratings may cause permanent damage to the device. Exposure to any Absolute Maximum Rating condition for extended periods may affect device reliability and lifetime.

Note 2: The inputs are protected by back-to-back diodes and two 100Ω series resistors. If the differential input voltage exceeds 0.7V, the input current should be limited to less than 10mA. Input voltages outside the supplies will be clamped by ESD protection devices and input currents should also be limited to less than 10mA.

Note 3: A heat sink may be required to keep the junction temperature below absolute maximum when the output is shorted indefinitely.

Note 4: The LT1469C-2 and LT1469I-2 are guaranteed functional over the operating temperature range of -40°C to 85°C.

Note 5: The LT1469C-2 is guaranteed to meet specified performance from 0°C to 70°C and is designed, characterized and expected to meet specified performance from -40°C to 85°C but is not tested or QA sampled at these temperatures. The LT1469I-2 is guaranteed to meet specified performance from -40°C to 85°C.

Note 6: Slew rate is measured between ±8V on the output with ±12V swing for ±15V supplies and ±2V on the output with ±3V swing for ±5V supplies. Tested in $A_V = -10$

Note 7: Full-power bandwidth is calculated from the slew rate. $FPBW = SR/2\pi V_P$.

Note 8: This parameter is not 100% tested.

Note 9: $\Delta CMRR$ and $\Delta PSRR$ are defined as follows: 1) CMRR and PSRR are measured in $\mu V/V$ on each amplifier; 2) the difference between the two sides is calculated in $\mu V/V$; 3) the result is converted to dB.

APPLICATIONS INFORMATION

Gain of 2 Stable

The LT1469-2 is a decompensated version of the LT1469. The DC precision performance is identical, but the internal compensation capacitors have been reduced to a point where the op amp needs a gain of 2 or greater in order to be stable.

In general, for applications where the gain around the op amp is ≥ 2 , the decompensated version should be used, because it will give the best AC performance. In applications where the gain is < 2 , the unity-gain stable version should be used.

The appropriate way to define the ‘gain’ is as the inverse of the feedback ratio from output to differential input, including all relevant parasitics. Moreover, as with all feedback loops, the stability of the loop depends on the value of that feedback ratio at frequencies where the total loop-gain would cross unity. Therefore, it is possible to have circuits in which the gain at DC is lower than the gain at high frequency, and these circuits can be stable even with a non unity-gain stable op amp. An example is many current-output DAC buffer applications.

Layout and Passive Components

The LT1469 requires attention to detail in board layout in order to maximize DC and AC performance. For best AC results (for example, fast settling time) use a ground plane, short lead lengths and RF quality bypass capacitors (0.01 μ F to 0.1 μ F) in parallel with low ESR bypass capacitors (1 μ F to 10 μ F tantalum). For best DC performance, use “star” grounding techniques, equalize input trace lengths and minimize leakage (e.g., 1.5G Ω of leakage between an

input and a 15V supply will generate 10nA—equal to the maximum I_{B-} specification).

Board leakage can be minimized by encircling the input circuitry with a guard ring operated at a potential close to that of the inputs: for inverting configurations tie the ring to ground, in noninverting connections tie the ring to the inverting input (note the input capacitance will increase which may require a compensating capacitor as discussed below).

Microvolt level error voltages can also be generated in the external circuitry. Thermocouple effects caused by temperature gradients across dissimilar metals at the contacts to the inputs can exceed the inherent drift of the amplifier. Air currents over device leads should be minimized, package leads should be short and the two input leads should be as close together as possible and maintained at the same temperature.

The parallel combination of the feedback resistor and gain setting resistor on the inverting input can combine with the input capacitance to form a pole which can cause peaking or even oscillations. A feedback capacitor of value $C_F = R_G \cdot C_{IN}/R_F$ may be used to cancel the input pole and optimize dynamic performance. For applications where the DC noise gain is one, and a large feedback resistor is used, C_F should be less than or equal to one half of C_{IN} . An example would be a DAC I-to-V converter as shown on the front page of the data sheet where the DAC can have many tens of picofarads of output capacitance.

APPLICATIONS INFORMATION

Input Considerations

Each input of the LT1469 is protected with a 100Ω series resistor and back-to-back diodes across the bases of the input devices. If large differential input voltages are anticipated, limit the input current to less than 10mA with an external series resistor. Each input also has two ESD clamp diodes—one to each supply. If an input is driven beyond the supply, limit the current with an external resistor to less than 10mA.

The LT1469 employs bias current cancellation at the inputs. The inverting input current is trimmed at zero common mode voltage to minimize errors in inverting applications such as I-to-V converters. The noninverting input current is not trimmed and has a wider variation and therefore a larger maximum value. As the input offset current can be greater than either input current, the use of balanced source resistance is NOT recommended as it actually degrades DC accuracy and also increases noise.

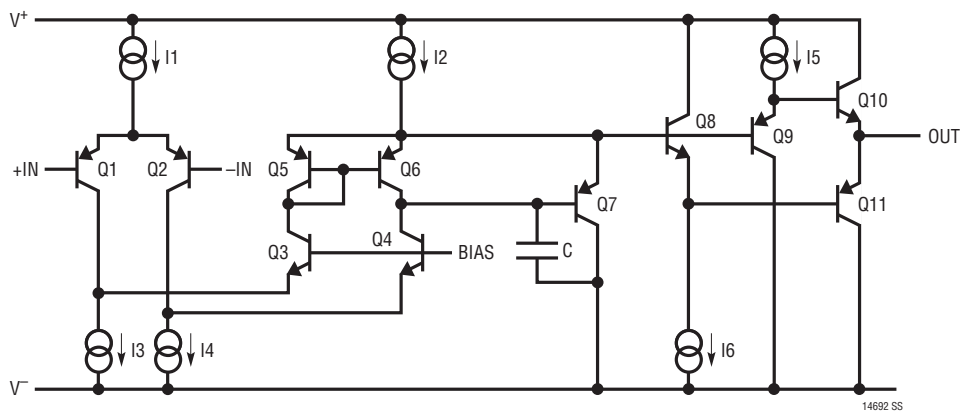

The input bias currents vary with common mode voltage. The cancellation circuitry was not designed to track this common mode voltage because the settling time would have been adversely affected.

The LT1469 inputs can be driven to the negative supply and to within 0.5V of the positive supply without phase reversal. As the input moves closer than 0.5V to the positive supply, the output reverses phase.

Total Input Noise

The total input noise of the LT1469 is optimized for a source resistance between 1k and 20k. Within this range, the total input noise is dominated by the noise of the source resistance itself. When the source resistance is below 1k, voltage noise of the amplifier dominates. When the source resistance is above 20k, the input noise current is the dominant contributor.

SIMPLIFIED SCHEMATIC

PACKAGE DESCRIPTION

S8 Package 8-Lead Plastic Small Outline (Narrow 0.150) (Reference LTC DWG # 05-08-1610)

DF Package 12-Lead Plastic DFN (4mm x 4mm) (Reference LTC DWG # 05-08-1773 Rev 0)

RELATED PARTS

PART NUMBER	DESCRIPTION	COMMENTS
LT1167	Precision Instrumentation Amplifier	Single Resistor Gain Set, 0.04% Max Gain Error, 10ppm Max Gain Nonlinearity
LT1468	Single 90MHz, 22V/ μ s, 16-Bit Accurate Op Amp	75 μ V Max V_{OS} , Single Version of LT1469
LTC1595/LTC1596	16-Bit Serial Multiplying I_{OUT} DAC	± 1 LSB Max INL/DNL, Low Glitch, DAC8043 16-Bit Upgrade
LTC1597	16-Bit Parallel Multiplying I_{OUT} DAC	± 1 LSB Max INL/DNL, Low Glitch, On-Chip Bipolar Resistors
LTC1604	16-Bit, 333ksps Sampling ADC	± 2.5 V Input, SINAD = 90dB, THD = -100dB
LTC1605	Single 5V, 16-Bit, 100ksps Sampling ADC	Low Power, ± 10 V Inputs, Parallel/Byte Interface

Компания «Life Electronics» занимается поставками электронных компонентов импортного и отечественного производства от производителей и со складов крупных дистрибьюторов Европы, Америки и Азии.

С конца 2013 года компания активно расширяет линейку поставок компонентов по направлению коаксиальный кабель, кварцевые генераторы и конденсаторы (керамические, пленочные, электролитические), за счёт заключения дистрибьюторских договоров

Мы предлагаем:

- Конкуренспособные цены и скидки постоянным клиентам.
- Специальные условия для постоянных клиентов.
- Подбор аналогов.
- Поставку компонентов в любых объемах, удовлетворяющих вашим потребностям.
- Приемлемые сроки поставки, возможна ускоренная поставка.
- Доставку товара в любую точку России и стран СНГ.
- Комплексную поставку.
- Работу по проектам и поставку образцов.
- Формирование склада под заказчика.
- Сертификаты соответствия на поставляемую продукцию (по желанию клиента).
- Тестирование поставляемой продукции.
- Поставку компонентов, требующих военную и космическую приемку.
- Входной контроль качества.
- Наличие сертификата ISO.

В составе нашей компании организован Конструкторский отдел, призванный помогать разработчикам, и инженерам.

Конструкторский отдел помогает осуществить:

- Регистрацию проекта у производителя компонентов.
- Техническую поддержку проекта.
- Защиту от снятия компонента с производства.
- Оценку стоимости проекта по компонентам.
- Изготовление тестовой платы монтаж и пусконаладочные работы.
