

# MAX35102

## Time-to-Digital Converter Without RTC

### General Description

The MAX35102 is a time-to-digital converter with built-in amplifier and comparator targeted as a low-cost, analog front-end solution for the ultrasonic heat meter and flow meter markets. It is similar to the MAX35101, but with a reduced feature set and without a real-time clock (RTC). The package size has been reduced to 4mm x 4mm x 0.75mm with 0.4mm pin pitch.

With a time measurement accuracy of 20ps and automatic differential time-of-flight (ToF) measurement, this device makes for simplified computation of liquid flow.

Power consumption is the lowest available with ultra-low 5.5 $\mu$ A ToF measurement and < 125nA duty-cycled temperature measurement.

### Applications

- Ultrasonic Heat Meters
- Ultrasonic Water Meters
- Ultrasonic Gas Meters

**Ordering Information** appears at end of data sheet.

### Features and Benefits

- High-Accuracy Flow Measurement for Billing and Leak Detection
  - Time-to-Digital Accuracy Down to 20ps
  - Measurement Range Up to 8ms
  - 2 Channels—Single-Stop Channel
- High-Accuracy Temperature Measurement for Precise Heat and Flow Calculations
  - Up to Four 2-Wire Sensors
  - PT1000 and PT500 RTD Support
  - 40mK Accuracy
- Maximizes Battery Life with Low Device and Overall System Power
  - Ultra-Low 5.5 $\mu$ A ToF measurement and < 125nA Duty-Cycled Temperature Measurement
  - 2.3V to 3.6V Single-Supply Operation
- High-Integration Solution Minimizes Parts Count and Reduces BOM Cost
  - Small, 4mm x 4mm, 32-Pin TQFN Package
  - -40°C to +85°C Operation

### System Block Diagram

### Absolute Maximum Ratings

(Voltages relative to ground.)	Operating Temperature Range.....	-40°C to +85°C
Voltage Range on V <sub>CC</sub> Pins.....	Junction Temperature.....	+150°C
Voltage Range on All Other Pins	Storage Temperature Range.....	-55°C to +125°C
(not to exceed 4.0V).....	Lead Temperature (soldering, 10s).....	+300°C
Continuous Power Dissipation (T <sub>A</sub> = +70°C)	Soldering Temperature (reflow).....	+260°C
TQFN (derate 29.40mW/°C above +70°C).....	ESD Protection (All Pins, Human Body Model).....	±2kV

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

### Package Thermal Characteristics (Note 1)

TQFN

Junction-to-Ambient Thermal Resistance (θ <sub>JA</sub> ) .....	34°C/W	Junction-to-Case Thermal Resistance (θ <sub>JC</sub> ).....	3°C/W
---	--------	---	-------

**Note 1:** Package thermal resistances were obtained using the method described in JEDEC specification JESD51-7, using a four-layer board. For detailed information on package thermal considerations, refer to [www.maximintegrated.com/thermal-tutorial](http://www.maximintegrated.com/thermal-tutorial).

### Recommended Operating Conditions

(T<sub>A</sub> = -40°C to +85°C, unless otherwise noted.) (Notes 2, 3)

PARAMETER	SYMBOL	CONDITIONS	MIN	TYP	MAX	UNITS
Supply Voltage	V <sub>CC</sub>		2.3	3.0	3.6	V
Input Logic 1 ( $\overline{\text{RST}}$ , SCK, DIN, $\overline{\text{CE}}$ )	V <sub>IH</sub>		V <sub>CC</sub> x 0.7	V <sub>CC</sub> + 0.3		V
Input Logic 0 ( $\overline{\text{RST}}$ , SCK, DIN, $\overline{\text{CE}}$ )	V <sub>IL</sub>		-0.3	V <sub>CC</sub> x 0.3		V
Input Logic 1 (32KX1)	V <sub>IH32KX1</sub>		V <sub>CC</sub> x 0.85	V <sub>CC</sub> + 0.3		V
Input Logic 0 (32KX1)	V <sub>IL32KX1</sub>		-0.3	V <sub>CC</sub> x 0.15		V

### Electrical Characteristics

(V<sub>CC</sub> = 2.3V to 3.6V, T<sub>A</sub> = -40°C to +85°C, unless otherwise noted. Typical values are at V<sub>CC</sub> = 3.0V and T<sub>A</sub> = +25°C.) (Notes 2, 3)

PARAMETER	SYMBOL	CONDITIONS	MIN	TYP	MAX	UNITS
Input Leakage ( $\overline{\text{RST}}$ , SCK, DIN, $\overline{\text{CE}}$ )	I <sub>L</sub>		-0.1		+0.1	µA
Output Leakage ( $\overline{\text{INT}}$ , T1, T2, T3, T4)	O <sub>L</sub>		-0.1		+0.1	µA
Output Voltage Low (32KOUT)	V <sub>OL32K</sub>	2mA			0.2 x V <sub>CC</sub>	V
Output Voltage High (32KOUT)	V <sub>OH32K</sub>	-1mA	0.8 x V <sub>CC</sub>			V
Output Voltage High (DOUT, CMP_OUT/UP_DN)	V <sub>OH</sub>	-4mA	0.8 x V <sub>CC</sub>			V
Output Voltage High (TC)	V <sub>OHTC</sub>	V <sub>CC</sub> = 3.3V, I <sub>OUT</sub> = -4mA	2.9	3.1		V
Output Voltage High (Launch_UP, Launch_DN)	V <sub>OHLAUCH</sub>	V <sub>CC</sub> = 3.3V, I <sub>OUT</sub> = -50mA	2.8	3.0		V
Output Voltage Low ( $\overline{\text{INT}}$ , DOUT, CMP_OUT/UP_DN)	V <sub>OL</sub>	4mA			0.2 x V <sub>CC</sub>	V

**Electrical Characteristics (continued)**(V<sub>CC</sub> = 2.3V to 3.6V, T<sub>A</sub> = -40°C to +85°C, unless otherwise noted. Typical values are at V<sub>CC</sub> = 3.0V and T<sub>A</sub> = +25°C.) (Notes 2, 3)

PARAMETER	SYMBOL	CONDITIONS	MIN	TYP	MAX	UNITS
Pulldown Resistance (TC)	R <sub>TC</sub>		650	1000	1500	Ω
Input Voltage Low (TC)	V <sub>ILTC</sub>		0.36 x V <sub>CC</sub>			V
Output Voltage Low (Launch_UP, Launch_DN)	V <sub>OLLAUCH</sub>	V <sub>CC</sub> = 3.3V, I <sub>OUT</sub> = 50mA		0.2	0.4	V
Resistance (T1, T2, T3, T4)	R <sub>ON</sub>			1		Ω
Input Capacitance ( $\overline{CE}$ , SCK, DIN, $\overline{RST}$ )	C <sub>IN</sub>	Not tested		7		pF
$\overline{RST}$ Low Time	t <sub>RST</sub>				100	ns
<b>CURRENT</b>						
Standby Current	I <sub>DDQ</sub>	No oscillators running, T <sub>A</sub> = +25°C		0.1	1	μA
32kHz OSC Current	I <sub>32KHZ</sub>	32kHz oscillator only (Note 4)		0.5	0.9	μA
4MHz OSC Current	I <sub>4MHZ</sub>	4MHz oscillator only (Note 4)		40	85	μA
LDO Bias Current	I <sub>CC LDO</sub>	I <sub>CC CPU</sub> = 0 (Note 4)		15	50	μA
Time Measurement Unit Current	I <sub>CC TMU</sub>	(Note 4)		4.5	8	mA
Calculator Current	I <sub>CC CPU</sub>			0.75	1.7	mA
Device Current Drain	I <sub>CC3</sub>	TOF_DIFF = 2 per second (3 hits), temperature = 1 per 30s		5.5		μA
<b>ANALOG RECEIVER</b>						
Analog Input Voltage (STOP_UP, STOP_DN)	V <sub>ANA</sub>		10	700	2 x V <sub>CC</sub> x (3/8)	mV <sub>P-P</sub>
Input Offset Step Size	V <sub>STEP</sub>			1		mV
STOP_UP/STOP_DN Bias Voltage	V <sub>BIAS</sub>			V <sub>CC</sub> x (3/8)		V
Receiver Sensitivity	V <sub>ANA</sub>	Stop hit detect level (Note 5)	10			mV <sub>P-P</sub>
<b>TIME MEASUREMENT UNIT</b>						
Measurement Range	t <sub>MEAS</sub>	Time of flight	8		8000	μs
Time Measurement Accuracy	t <sub>ACC</sub>	Differential time measurement		20		ps
Time Measurement Resolution	t <sub>RES</sub>			3.8		ps
<b>EXECUTION TIMES</b>						
Power-On-Reset Time	t <sub>RESET</sub>	Reset to POR INT		275		μs
INIT Command Time	t <sub>INIT</sub>	Command received when INIT bit set		2.5		ms
CAL Command Time	t <sub>CAL</sub>	Command received when CAL bit set		1.25		ms

**Electrical Characteristics (continued)**(V<sub>CC</sub> = 2.3V to 3.6V, T<sub>A</sub> = -40°C to +85°C, unless otherwise noted. Typical values are at V<sub>CC</sub> = 3.0V and T<sub>A</sub> = +25°C.) (Notes 2, 3)

PARAMETER	SYMBOL	CONDITIONS	MIN	TYP	MAX	UNITS
<b>SERIAL PERIPHERAL INTERFACE</b>						
DIN to SCK Setup	t <sub>DC</sub>				20	ns
SCK to DIN Hold	t <sub>CDH</sub>			2	20	ns
SCK to DOUT Delay	t <sub>CDD</sub>			5	20	ns
SCK Low Time	t <sub>CL</sub>	V <sub>CC</sub> ≥ 3.0V	25	4		ns
		V <sub>CC</sub> = 2.3V	50	30		
SCK High Time	t <sub>CH</sub>		25	4		ns
SCK Frequency	t <sub>CLK</sub>	V <sub>CC</sub> ≥ 3.0V			20	MHz
		V <sub>CC</sub> = 2.3V			10	
$\overline{\text{CE}}$ to SCK Setup	t <sub>CC</sub>			5	40	ns
SCK to $\overline{\text{CE}}$ Hold	t <sub>CCH</sub>				20	ns
$\overline{\text{CE}}$ Inactive Time	t <sub>CWH</sub>			2	40	ns
$\overline{\text{CE}}$ to DOUT High Impedance	t <sub>CCZ</sub>			5	20	ns

**Recommended External Crystal Characteristics**

PARAMETER	SYMBOL	CONDITIONS	MIN	TYP	MAX	UNITS
32kHz Nominal Frequency	f <sub>32K</sub>			32.768		kHz
32kHz Frequency Tolerance	Δf <sub>32K</sub> /f <sub>32K</sub>	T <sub>A</sub> = +25°C	-20		+20	ppm
32kHz Load Capacitance	CL <sub>32K</sub>			12.5		pF
32kHz Series Resistance	RS <sub>32K</sub>				70	kΩ
4MHz Crystal Nominal Frequency	F <sub>4M</sub>			4.000		MHz
4MHz Crystal Frequency Tolerance	Δf <sub>4M</sub> /f <sub>4M</sub>	T <sub>A</sub> = +25°C	-30		+30	ppm
4MHz Crystal Load Capacitance	CL <sub>4M</sub>			12.0		pF
4MHz Crystal Series Resistance	RS <sub>4M</sub>				120	Ω
4MHz Ceramic Nominal Frequency				4.000		MHz
4MHz Ceramic Frequency Tolerance		T <sub>A</sub> = +25°C	-0.5		+0.5	%
4MHz Ceramic Load Capacitance				30		pF
4MHz Ceramic Series Resistance					30	Ω

**Note 2:** All voltages are referenced to ground. Current entering the device are specified as positive and currents exiting the device are negative.

**Note 3:** Limits are 100% production tested at T<sub>A</sub> = +25°C. Limits over the operating temperature range and relevant supply voltage range are guaranteed by design and characterization.

**Note 4:** Currents are specified as individual block currents. Total current for a point in time can be calculated by taking the standby current and adding any block currents that are active at that time.

**Note 5:** Receiver sensitivity includes performance degradation contributed by STOP\_UP and STOP\_DN device pin input offset voltage and common mode drift.

Timing Diagrams

Figure 1. SPI Timing Diagram Read

Typical Operating Characteristics

(V<sub>CC</sub> = 3.3V and T<sub>A</sub> = +25°C, unless otherwise noted.)

Average ICC vs. TOF Rate Configuration Settings

CONTROL BIT(S)	3 HIT SETTINGS	
	VALUE	BIT SETTINGS
Clock Settling Time	488µs	CLK_S[2:0] = 000
Bias Charge Time	61µs	CT[1:0] = 00
Pulse Launch Frequency	1MHz	DPL[3:0] = 0001
Pulse Launcher Size	15	PL[7:0] = 00001111
ToF Duty Cycle	19.97ms	TOF_CYC[2:0] = 111
Stop Hits	3	STOP[1:0] = 010
T2 Wave Selector	Wave 2	T2WV[5:0] = 000110
Temperature Port Number	4	TP[1:0] = 11
Preamble Temperature Cycle Number	1	PRECYC[2:0] = 001
Port Cycle Time	256µs	PORTCYC[1:0] = 01

Notes

1. This data is valid for the ceramic resonator.
2. Crystal oscillator startup adds ~0.5µA per TOFDiff.
3. Since the TOF cycle time is long the 4MHz oscillator powers up twice.

Pin Configuration

Pin Description

PIN	NAME	FUNCTION
1, 16, 22, 25, 28, 30	GND	Device Ground
2	BYPASS	Connect this pin to ground with a capacitor (100nF) to provide stability for the on-board low-dropout regulator. The effective series resistance of this capacitor needs to be in the 1Ω to 2Ω range.
3, 6, 29	VCC	Main Supply. Typically sourced from a single lithium cell.
4	32KOUT	CMOS Output. Repeats the 32kHz crystal oscillator frequency.
5	LAUNCH_DN	CMOS Pulse Output Transmission in Downstream Direction of Water Flow
7	LAUNCH_UP	CMOS Pulse Output Transmission in Upstream Direction of Water Flow
8	CMP_OUT/UP_DN	CMOS Output. Indicates the direction (upstream or downstream) of which the pulse launcher is currently launching pulses OR the comparator output.
9	$\overline{\text{INT}}$	Active-Low Open-Drain Interrupt Output. The pin is driven low when the device requires service from the host microprocessor.
10	$\overline{\text{CE}}$	Active-Low CMOS Digital Input. Serial peripheral interface chip enable input.

## Pin Description (continued)

PIN	NAME	FUNCTION
11	SCK	CMOS Digital Input. Serial peripheral interface clock input.
12	DIN	CMOS Digital Input. Serial peripheral interface data input.
13	DOUT	CMOS Output. Serial peripheral interface data output.
14	RST	Active-Low CMOS Digital Reset Input
15	DNC	Do Not Connect. This pin must be left unconnected.
17	T1	Open-Drain Probe 1 Temperature Measurement
18	T2	Open-Drain Probe 2 Temperature Measurement
19	T3	Open-Drain Probe 3 Temperature Measurement
20	T4	Open-Drain Probe 4 Temperature Measurement
21	TC	Input/Output Temperature Measurement Capacitor Connection
23	32KX0	Connections for 32.768kHz Quartz Crystal. An external CMOS 32.768kHz oscillator can also drive the MAX35102. In this configuration, the 32KX1 pin is connected to the external oscillator signal and the 32KX0 pin is left unconnected.
24	32KX1	
26	STOP_DN	Downstream STOP Analog Input. Used for the signal that is received from the downstream transmission of a time-of-flight measurement.
27	STOP_UP	Upstream STOP Analog Input. Used for the signal that is received from the upstream transmission of a time-of-flight measurement.
31	X2	Connections for 4MHz Quartz Crystal. A ceramic resonator can also be used.
32	X1	
—	EP	Exposed Pad. Connect to GND.

Block Diagram

Detailed Description

The MAX35102 is a time-to-digital converter with built-in amplifier and comparator targeted as a complete analog front-end solution for the ultrasonic heat meter and flow meter markets.

With automatic differential time-of-flight (TOF) measurement, this device makes for simplified computation of liquid flow. Early edge detection ensures measurements are made with consistent wave patterns to greatly improve accuracy and eliminate erroneous measurements. Built-in arithmetic logic unit provides TOF difference measurements. A programmable receiver hit accumulator can be utilized to minimize the host microprocessor access.

Multihit capability with stop-enable windowing allows the device to be fine-tuned for the application. Internal analog switches, an autozero amplifier/comparator, and programmable receiver sensitivity provide the analog interface and control for a minimal electrical bill of materials solutions.

For temperature measurement, the MAX35102 supports up to four 2-wire PT1000/500 platinum resistive temperature detectors (RTD).

A simple opcode based 4-Wire SPI interface allows any microcontroller to effectively configure the device for its intended measurement.

Time-of-Flight (ToF) Measurement Operations

TOF is measured by launching pulses from one piezoelectric transducer and receiving the pulses at a second transducer. The time between when the pulses are launched and received is defined as the time of flight. The MAX35102 contains the functionality required to create a string of pulses, sense the receiving pulse string, and measure the time of flight. The MAX35102 can measure two separate TOFs, which are defined as TOF up and TOF down.

Figure 3. Time-of-Flight Sequence

A TOF up measurement has pulses launched from the LAUNCH\_UP pin, which is connected to the downstream transducer. The ultrasonic pulse is received at the upstream transducer, which is connected to the STOP\_UP pin. A TOF down measurement has pulses launched from the LAUNCH\_DN pin, which is connected to the upstream transducer. The ultrasonic pulse is received at the downstream transducer, which is connected to the STOP\_DN pin.

TOF measurements can be initiated by sending either the TOF\_UP, TOF\_DN, or TOF\_DIFF commands.

The steps involved in a single TOF measurement are described here and shown in Figure 3.

- 1) The 4MHz oscillator and LDO is enabled with a programmable settling delay time set by the CLK\_S[2:0] bits in Calibration and Control register.
- 2) A common-mode bias is enabled on the STOP pin. This bias charge time is set by the CT[1:0] bits in the TOF1 register.
- 3) Once the bias charge time has expired, the pulse launcher drives the appropriate LAUNCH pin with a programmable sequence of pulses. The number of pulses launched is set by the PL[7:0] bits in the TOF1 register. The frequency of these 50% duty-cycle pulses is set by the DPL[3:0] bits, also in the TOF1 register. The start of these launch pulses gen-

erates a start signal for the time-to-digital converter (TDC) and is considered to be time zero for the TOF measurement. This is denoted by the start signal in the start/stop TDC timing (Figure 3).

- 4) After a programmable delay time set in TOF Measurement Delay register, the comparator and hit detector at the appropriate STOP pin are enabled. This delay allows the receiver to start recording hits when the received wave is expected, eliminating possible false hits from noise in the system.
- 5) Stop hits are detected according to the programmed preferred edge of the acoustic signal sequence received at the STOP pin according to the setting of the STOP\_POL bit in the TOF1 register. The first stop hit is detected when a wave received at the STOP pin exceeds the comparator offset voltage, which is set in the TOF6 and TOF7 registers. This first detected wave is wave number 0. The width of the wave's pulse that exceeds the comparator offset voltage is measured and stored as the t1 time.
- 6) The offset of the comparator then automatically and immediately switches to 0.
- 7) The t2 wave is detected and the width of the t2 pulse is measured and stored as the t2 time. The wave number for the measurement of the t2 wave width is set by the T2WV[5:0] bits in the TOF2 register.

- 8) Following the  $t_2$  wave, 1 to 3 consecutive stop hits are then detected. For each hit, the measured TOF is stored in the appropriate HITxUPINT and HITxUPFrac or HITxDNINT and HITxDNFRAC registers. The number of hits to detect is set by the STOP[1:0] bits in the TOF2 register.
- 9) After receiving all of the programmed hits, the MAX35102 calculates the average of the recorded hits and stores this to AVGUPINT and AVGUPFrac or AVGDNInt and AVGDNFrac. The ratio of  $t_1/t_2$  and  $t_2/t_{ideal}$  are calculated and stored in the WVRUP or WVRDN register.
- 10) Once all of the hit data, wave ratios, and averages become available in the Results registers, the TOF bit in the Interrupt Status register is set and the  $\overline{INT}$  pin is asserted (if enabled) and remains asserted until the Interrupt Status register is accessed by the microprocessor with a Read Register command.

The computation of the total time of flight is performed by counting the number of full and fractional 4MHz clock cycles that elapsed between the launch start and a hit stop as shown in Figure 4.

Each TOF measurement result is comprised of an integer portion and a fractional portion. The integer portion is a binary representation of the number of  $t_{4MHz}$  periods that contribute to the time results. The fractional portion is a binary representation of one  $t_{4MHz}$  period quantized to a 16-bit resolution. The maximum size of the integer is

7FFFh or  $(2^{15}-1) \times t_{4MHz}$  or  $\sim 8.19$  ms. The maximum size of the fraction is:

$$FFFFh \text{ or } \frac{2^{16}-1}{2^{16}} \times t_{4MHz} \text{ or } \sim 249.9961 \text{ ns.}$$

**Table 1. Two's Complement TOF\_DIFF Conversion Example**

REGISTER VALUE		CONVERTER VALUE
TOF_DIFFInt (hex)	TOF_DIFFFrac (hex)	TOF DIFF VALUE (ns)
7FFF	FFFF	8,191,999.9962
001C	0403	7,003.9177
0001	00A1	250.6142
0000	0089	0.5226
0000	0001	0.0038
0000	0000	0.0000
FFFF	FFFF	-0.0038
FFFF	FFC0	-0.2441
FFFE	1432	-480.2780
FF1C	8001	-56,874.9962
8000	0000	-8,192,000.0000

Figure 4. Start/Stop for Time-to-Digital Timing

**Early Edge Detect**

This early edge detect method of measuring the TOF of acoustic waves is used for all of the TOF commands including TOF\_UP, TOF\_DN, and TOF\_DIFF. This method allows the MAX35102 to automatically control the input offset voltage of the receiver comparator so that it can provide advanced measurement accuracy. The input offset of the receiver comparator can be programmed with a range +31 LSBs if triggering on a positive edge and -32 LSBs if triggering on a negative edge, with 1 LSB =  $V_{CC}/3072$ . Separate input offset settings are available for the upstream received signal and the downstream received signal. The input offset for the upstream received signal is programmed using the C\_OFFSETUP[4:0] bits in the TOF6 register. The input offset for the downstream received signal is programmed using the C\_OFFSETDN[4:0] bits in the TOF7 register. Once the first hit is detected, the time  $t_1$  equal to the width of the earliest detectable edge is measured. The input offset voltage is then automatically and immediately returned to 0.

The MAX35102 is now ready to measure the successive hits. The next selected wave that is measured is the  $t_2$  wave. In the example in [Figure 5](#), this is the 7th wave after

the early edge detect wave. The selection of the  $t_2$  wave is made with the T2WV[5:0] bits in the TOF2 register.

With reference to [Figure 5](#), the ratio  $t_1/t_2$  is calculated and registered for the user. This ratio allows determination of abrupt changes in flow rate, received signal strength, partially filled tube detection, and empty tube. It also provides noise suppression to prevent erroneous edge detection. Also, the ratio  $t_2/t_{ideal}$  is calculated and registered for the user. For this calculation,  $t_{ideal}$  is 1/2 the period of launched pulse. This ratio adds confirmation that the  $t_2$  wave is a strong signal, which provides insight into the common mode offset of the received acoustic wave.

**TOF Error Handling**

Any of the TOF measurements can result in an error. If an error occurs during the measurement, all of the associated registers report FFFFh. If a TOF\_DIFF is being performed, the TOF\_DIFFInt and TOF\_DIF\_Frac registers report 7FFFh and FFFFh, respectively. If the measurement error is caused by the time measurement exceeding the timeout set by the TIMEOUT[2:0] bits in the TOF2 register, then the TO bit in the Interrupt Status register is set and the  $\overline{INT}$  pin asserts (if enabled).

Figure 5. Early Edge Detect Received Wave Example

**Temperature Measurement Operations**

A temperature measurement is a time measurement of the RC circuit connected to the temperature port device pins T1 through T4 and TC. The TC device pin has a driver to charge the timing capacitor. The ports that are measured and the order in which the measurement is performed is selected with the TP[1:0] bits in the Temperature register.

Figure 6 depicts a 1000Ω platinum RTD with a 100nF NPO COG 30ppm/°C capacitor. It shows two dummy cycles with 4 temperature port evaluation measurements and 4 real temperature port measurements. This occurs when setting the TP[1:0] bits in the Temperature register to 11b.

The dummy 1 and dummy 2 cycles represent preamble measurements that are intended to eliminate the dielectric absorption of the temperature measurement capacitor. These dummy cycles are executed using a RTD Emulation resistor of 1000Ω internal to the MAX35102. This dummy path allows the dielectric absorption effects of the capacitor to be eliminated without causing any of the RTDs to be unduly self-heated. The number of dummy measurements to be taken ranges from 0 to 7. This parameter is configured by setting the PRECYC[2:0] bits in the Temperature register.

Following the dummy cycles, an evaluation, TXevaluate, is performed. This measurement allows the MAX35102

to maximize power efficiency by evaluating the temperature of the RTDs with a coarse measurement prior to a real measurement. The coarse measurement provides an approximation to the TDC converter. During the real measurement, the TDC can then optimize its measurement parameters to use power efficiently. These evaluate cycles are automatically inserted according to the order of ports selected with the of the Temperature Port bits. The time from the start of one port’s temperature measurement to the next port’s temperature measurement is set using with the PORTCYC[1:0] bits in the Temperature register.

Once all the temperature measurements are completed, the times measured for each port are reported in the corresponding TxInt and TxFrac Results registers. The TE bit in the Interrupt Status register is also set and the INT pin asserts (if enabled).

Actual temperature is determined by a ratiometric calculation. If T1 and T2 are connected to platinum RTDs and T3 and T4 are connected to the same reference resistor (as shown in the System Diagram), then the ratio of  $T1/T3 = R_{RTD1}/R_{REF}$  and  $T2/T4 = R_{RTD2}/R_{REF}$ . The ratios  $R_{RTD1}/R_{REF}$  and  $R_{RTD2}/R_{REF}$  can be determined by the host microprocessor and the temperature can be derived from a look-up table of Temperature vs. Resistance for each of the RTDs utilizing interpolation of table entries if required.

Figure 6. Temperature Command Execution Cycle Example

### Temperature Error Handling

The temperature measurement unit can detect open and/or short-circuit temperature probes. If the resultant temperature reading in less than 8 $\mu$ s, then the MAX35102 writes a value of 0000h to the corresponding Results registers to indicate a short-circuit temperature probe. If the measurement process does not discharge the TC pin below the threshold of the internal temperature comparator within 2 $\mu$ s of the time set by the PORTCYC[1:0] bits in the Temperature register, then an open circuit temperature probe error is declared. The MAX35102 writes a value of FFFFh to the corresponding results registers to indicate an open circuit temperature probe, the TO bit in the Interrupt Status register is set, and the  $\overline{\text{INT}}$  pin asserts (if enabled). If the temperature measurement error is caused by any other problems, then the MAX35102 writes a value of FFFFh to each of the temperature port results registers indicating that all of the temperature port measurements are invalid.

### Calibration Operation

For more accurate results, calibration of the TDC can be performed. Calibration allows the MAX35102 to perform a calibration measurement that is based upon the 32.768kHz crystal, which is the most accurate clock in the system. This calibration is used when a ceramic oscillator is used in place of an AT-cut crystal for the 4MHz reference. The MAX35102 automatically generates START and STOP signals based upon edges of the 32.768kHz clock. The number of 32.768kHz clock periods that are used and then averaged are selected with the CAL\_PERIOD[3:0] bits in the Calibration and Control register. The TDC measures the number of 4MHz clock pulses that occur during the 32.768kHz pulses. The measured time of a 32.768kHz clock pulse is reported in the CalibrationInt and CalibrationFrac Results registers.

Following is a description of an example calibration. Each TDC measurement is a 15-bit fixed-point integer value concatenated with a 16-bit fractional value binary representation of the number of  $t_{4\text{MHz}}$  periods that contribute to the time result, the actual period of  $t_{4\text{MHz}}$  needs to be known. If the CAL\_PERIOD[3:0] bits in the Calibration and Control register are set to 6, then 6 measurements of 32.768kHz periods are measured by the TDC and then averaged. The expected measured value would be  $30.5176\mu\text{s}/250\text{ns} = 122.0703125 t_{4\text{MHz}}$  periods. Assume that the 4MHz ceramic resonator is actually running at 4.02MHz. The TDC measurement unit would then measure  $30.5176\mu\text{s}/248.7562\text{ns} = 122.6806641 t_{4\text{MHz}}$  periods and this result would be

returned in the Calibration Results register. For all TDC measurements, a gain value of  $122.0703125/122.6806641 = 0.995024876$  would then be applied.

Calibration is performed when the Calibration command is sent to the MAX35102. At the completion of this calibration, the CAL bit in the Interrupt Status register and the  $\overline{\text{INT}}$  pin asserts (if enabled).

### Error Handling During Calibration

Any errors that occur during the Calibrate command stop the CalibrationInt and the CalibrationFrac Results registers from being updated with new calibration coefficients. The results for the previous Calibration data remain in these two registers and are used for scaling measured results. If the calibration error is caused by the internal calibration time measurement exceeding the time set by the TIMEOUT[2:0] bits in the TOF2 register, then the TO bit in the Interrupt Status register is set and the  $\overline{\text{INT}}$  pin asserts (if enabled).

### Device Interrupt Operations

The MAX35102 is designed to optimize the power efficiency of a flow metering application by allowing the host microprocessor to remain in a low-power sleep mode, instead of requiring the microprocessor to keep track of complex real-time events being performed by the MAX35102. Upon completion of any command, the MAX35102 alerts the host microprocessor using the  $\overline{\text{INT}}$  pin. The assertion of the  $\overline{\text{INT}}$  pin can be used to awaken the host microprocessor from its low power mode. Upon receiving an interrupt on the  $\overline{\text{INT}}$  pin, the host microprocessor should read the Interrupt Status Register to determine which tasks were completed.

### Interrupt Status Register

The interrupt status register contains flags for all for all commands and events that occur within the MAX35102. These flags are set when the event occurs or at the completion of the executing command. When the Interrupt Status Register is read, all asserted bits are cleared. If another interrupt source has generated an interrupt during the read, these new flags assert following the read.

### $\overline{\text{INT}}$ Pin

The  $\overline{\text{INT}}$  pin asserts when any of the bits in the Interrupt Status register are set. The  $\overline{\text{INT}}$  pin remains asserted until the Interrupt Status register is read by the user and all bits in this register are clear. In order for the  $\overline{\text{INT}}$  pin to operate, it must first be enabled by setting the INT\_EN bit in the Calibration and Control register.

**Serial Peripheral Interface Operation**

Four pins are used for SPI-compatible communications: DOUT (serial-data out), DIN (serial-data in),  $\overline{CE}$  (chip enable), and SCK (serial clock). DIN and DOUT are the serial data input and output pins for the devices, respectively. The  $\overline{CE}$  input initiates and terminates a data transfer. SCK synchronizes data movement between the master (microcontroller) and the slave (MAX35102). The SCK, which is generated by the microcontroller, is active only when  $\overline{CE}$  is low and during opcode and data transfer to any device on the SPI bus. The inactive clock polarity is logic-low. DIN is latched on the falling edge of SCK. There is one clock for each bit transferred. Opcode bits are transferred in groups of eight, MSB first. Data bits are transferred in groups of sixteen, MSB first.

The serial peripheral interface is used to access the features and memory of the MAX35102 using an opcode/command structure.

**Opcode Commands**

Table 2 shows the opcode/commands that are supported by the device.

**Execution Opcode Commands**

The device supports several single byte opcode commands that cause the MAX35102 to execute various routines. All commands have the same SPI protocol sequence as shown in Figure 7. Once all 8 bits of the opcode are received by the MAX35102 and the CE device pin is deasserted, the MAX35102 begins execution of the specified command as described in that Command's description.

**TOF\_UP Command (00h)**

The TOF\_UP command generates a single TOF measurement in the upstream direction. Pulses launch from the LAUNCH\_UP pin and are received by the STOP\_UP pin. The measured hit results are reported in the HITxUPInt and HITxUPFrac registers, with the calculated average of all the measured hits being reported in the AVGUPInt and AVGUPFrac register. The  $t_1/t_2$  and  $t_2/t_{ideal}$  wave ratios are reported in the WVRUP register. Once all these results are stored, then the TOF bit in the Interrupt Status register is set and the  $\overline{INT}$  pin asserts (if enabled).

**Note:** The TOF\_UP command yields a result that is only of use when used in conjunction with the TOF\_DN command. Absolute TOF measurements include circuit delays and cannot be considered accurate.

**Table 2. Opcode Commands**

GROUP	COMMAND	OPCODE FIELD (HEX)
Execution Opcode Commands	TOF_Up	00h
	TOF_Down	01h
	TOF_Diff	02h
	Temperature	03h
	Reset	04h
	Initialize	05h
	Calibrate	0Eh
Register Opcode Commands	Read Register	80h thru FFh. Each hex value represents the location of a single 16-bit register
	Write Register	30h thru 43h. Each hex value represents the location of a single 16-bit register

Figure 7. Execution Opcode Command Protocol

**TOF\_Down Command (01h)**

The TOF\_DOWN command generates a single TOF measurement in the downstream direction. Pulses launch from the LAUNCH\_DN pin and are received by the STOP\_DN pin. The measured hit results are reported in the HITxDnInt and HITxDnFrac registers, with the calculated average of all the measured hits being reported in the AVGDNInt and AVGDNFrac register. The  $t_1/t_2$  and  $t_2/t_{ideal}$  wave ratios are reported in the WVRDN register. Once all these results are stored, then the TOF bit in the Interrupt Status register is set and the  $\overline{INT}$  pin asserts (if enabled).

**Note:** The TOF\_Down command yields a result that is only of use when used in conjunction with the TOF\_UP command. Absolute TOF measurements include circuit delays and cannot be considered accurate.

**TOF\_DIFF Command (02h)**

The TOF\_DIFF command performs back-to-back TOF\_UP and TOF\_DN measurements as required for a metering application. The TOF\_UP sequence is followed by the TOF\_DN sequence. The time between the start of the TOF\_UP measurement and the start of the TOF\_DN measurement is set by the TOF\_CYC[2:0] bits in the TOF2 register. Upon completion of the TOF\_DN measurement, the results of AVGUP minus AVGDN is computed and stored at the TOF\_DIFFInt and TOF\_DIFFFrac Results register locations. Once these results are stored, then the TOF bit in the Interrupt Status register is set and the  $\overline{INT}$  pin asserts (if enabled).

**Temperature Command (03h)**

The temperature command initiates a temperature measurement sequence as described in the [Temperature Measurement Operations](#) section. The characteristics the temperature measurement sequence depends upon the settings in the Temperature register. Once all the measurements are completed, the times measured for each port are reported in the corresponding TxInt and TxFrac Results registers. The TE bit in the Interrupt Status register also is set and the  $\overline{INT}$  pin asserts (if enabled).

**Reset Command (04h)**

The reset command essentially performs the same function as a power-on reset (POR), and causes all of the Configuration registers to be set to their power-on reset values and all of the Results registers and the Interrupt Status register to be cleared and set to zero.

**Initialize Command (05h)**

The initialize command must be executed before any configuration of the device is done. This initializes the time-to-digital converter so that TOF and temperature commands can be executed. The MAX35102 sets the INIT bit in the Interrupt Status register and asserts the  $\overline{INT}$  device pin (if enabled) to tell the host microprocessor that the initialize command has completed and the next desired command can be sent to the MAX35102.

**Calibrate Command (0Eh)**

The calibrate command performs the calibration routine as described in the calibration operation section. When the calibrate command has completed the measurement, the Calibration Results register contains the measured 32kHz period measurement value, the MAX35102 sets the calibration bit in the Interrupt Status register and then asserts the  $\overline{INT}$  device pin (if enabled). The host microprocessor reads the Interrupt Status register to determine the interrupt source and then read the Calibration Results register to be able to calculate the 4MHz ceramic oscillator gain factor.

**Register Opcode Commands**

To manipulate the register memory, there are two commands supported by the device: Read Register and Write register. Each register accessed with these commands is 16 bits in length. These commands are used to access all sections of the memory map including the Configuration registers, Conversion Results registers, and Status registers. The Conversion Results registers and the Interrupt Status register of the Status registers are all read only.

**Read Register Command**

The opcode must be clocked into the DIN device pin before the DOUT device pin produces the register data. The SPI protocol sequence is shown in [Figure 8](#).

The read register command can also be used to read consecutive addresses. In this case, the data bits are continuously delivered in sequence starting with the MSB of the data register that is addressed in the opcode, and continues with each SCK rising edge until the  $\overline{CE}$  device pin is deasserted as shown in [Figure 9](#). The address counter automatically increments.

Figure 8. Read Register Opcode Command Protocol

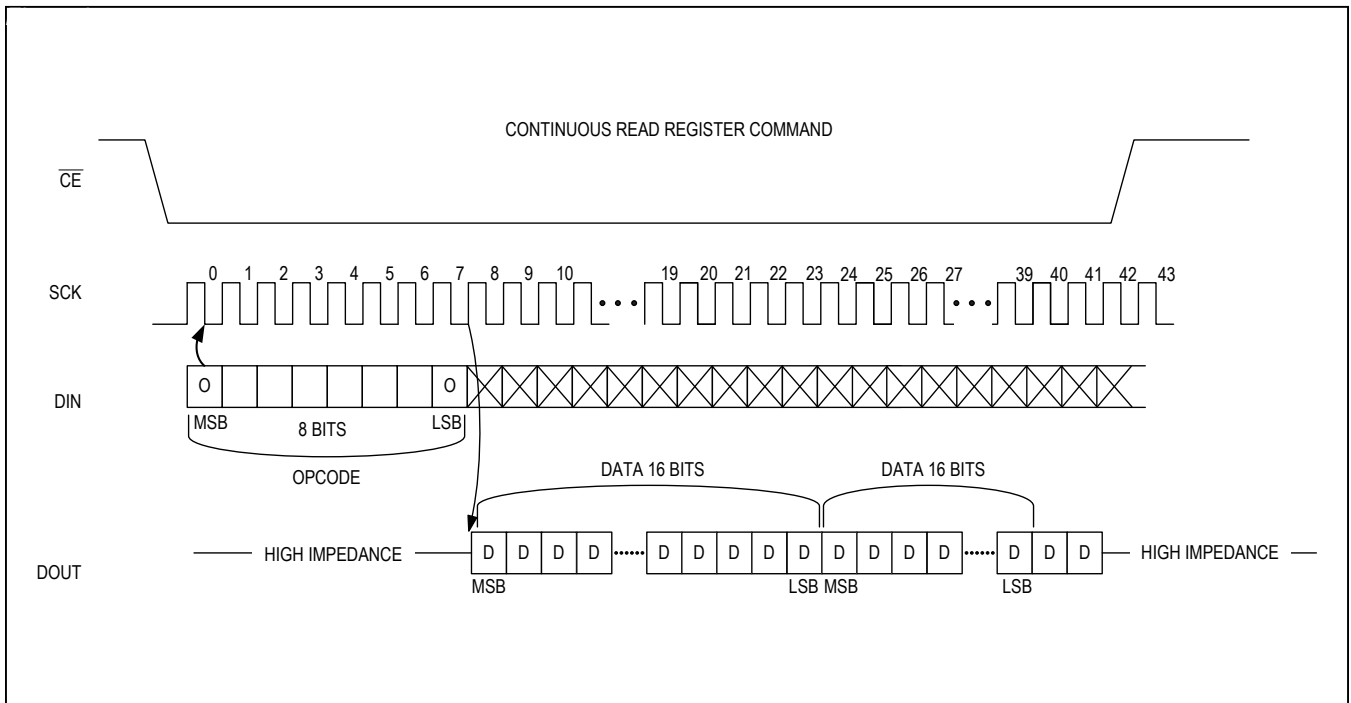

Figure 9. Continuous Read Register Opcode Command Protocol

**Write Register Command**

This command applies to all writable registers. See the [Register Memory Map](#) for more detail. The SPI protocol sequence is shown in [Figure 10](#).

The write register command can also be used to write consecutive addresses. In this case, the data bits are continuously received on the DIN device pin and bound for the initial starting address register that is addressed in the opcode. The address counter automatically increments

after each 16 bits of data if the SCK device pin is continually clocked and the  $\overline{CE}$  device pin remain asserted as shown in [Figure 11](#).

**Register Memory Map**

These registers are accessed by the read register command and the Write Register command: X represents a reserved bit. All addresses omitted are reserved

The Results, Interrupt Status, and Control registers are all 0000h following a reset.

BIT	NAME	DESCRIPTION						
15:0	DLY[15:0]	This is hexadecimal value ranging from 0000h to FFFFh (decimal 0 to 65535). It is a multiple of the 4MHz crystal period (250ns). Settings less than 0012h are reserved and should not be used. The analog comparator driven by the STOP_UP and STOP_DN device pins does not generate a stop condition until this delay, counted from the internally generated start pulse for the acoustic wave, has expired. This delay applies to early edge detect wave. Care must be taken to set the TIMEOUT bits in the TOF2 register so that a timeout interrupt does not occur before this delay expires.

1	0.5	0.25	0.125	0.0625	0.03125	0.015625	0.0078125											
The maximum value of each of these ratios is 1.9921875.																		
D4h	Hit1DNInt	15-bit fixed-point integer value of the first hit in the downstream direction. This integer portion is a binary representation of the number of $t_{4\text{MHz}}$ periods that contribute to the time results. The maximum size of the integer is 7FFFh or $(2^{15} - 1) \times t_{4\text{MHz}}$ .																
D5h	Hit1DNFrac	16-bit fractional value of the first hit in the downstream direction. This fractional portion is a binary representation of one $t_{4\text{MHz}}$ period quantized to a 16-bit resolution. The maximum size of the fraction is FFFFh or $(2^{16} - 1)/2^{16} \times t_{4\text{MHz}}$ .																
D6h	Hit2DNInt	15-bit fixed-point integer value of the second hit in the downstream direction. This integer portion is a binary representation of the number of $t_{4\text{MHz}}$ periods that contribute to the time results. The maximum size of the integer is 7FFFh or $(2^{15} - 1) \times t_{4\text{MHz}}$ .																

Table 13. Conversion Results Registers Description (continued)

READ ONLY ADDRESS	NAME	DESCRIPTION
D7h	Hit2DNFrac	16-bit fractional value of the second hit in the downstream direction. This fractional portion is a binary representation of one $t_{4\text{MHz}}$ period quantized to a 16-bit resolution. The maximum size of the fraction is FFFFh or $(2^{16} - 1)/2^{16} \times t_{4\text{MHz}}$ .
D8h	Hit3DNInt	15-bit fixed-point integer value of the third hit in the downstream direction. This integer portion is a binary representation of the number of $t_{4\text{MHz}}$ periods that contribute to the time results. The maximum size of the integer is 7FFFh or $(2^{15} - 1) \times t_{4\text{MHz}}$ .
D9h	Hit3DNFrac	16-bit fractional value of the third hit in the downstream direction. This fractional portion is a binary representation of one $t_{4\text{MHz}}$ period quantized to a 16-bit resolution. The maximum size of the fraction is FFFFh or $(2^{16} - 1)/2^{16} \times t_{4\text{MHz}}$ .
E0h	AVGDNInt	15-bit fixed-point integer value of the average of the hit times recorded in the downstream direction. This integer portion is a binary representation of the number of $t_{4\text{MHz}}$ periods that contribute to the time results. The maximum size of the integer is 7FFFh or $(2^{15} - 1) \times t_{4\text{MHz}}$ .
E1h	AVGDNFrac	16-bit fractional value of the average of the hit times recorded in the downstream direction. This fractional portion is a binary representation of one period quantized to a 16-bit resolution. The maximum size of the fraction is FFFFh or $(2^{16} - 1)/2^{16} \times t_{4\text{MHz}}$ .
E2h	TOF_DIFFInt	16-bit fixed-point two's-complement integer portion of the difference of the averages for the hits recorded in both the upstream and downstream directions. It is computed as: $\text{AVGUP} - \text{AVGDN}$ This integer represents the number of $t_{4\text{MHz}}$ periods that contribute to computation. The maximum size of the integer is 7FFFh or $(2^{15} - 1) \times t_{4\text{MHz}}$ . The minimum size of this integer is 8000h or $-2^{15} \times t_{4\text{MHz}}$ .
E3h	TOF_DIFFFrac	16-bit fractional portion of the two's complement difference of the averages for the hits recorded in both the upstream and downstream directions. This fractional portion is a binary representation of one $t_{4\text{MHz}}$ period quantized to a 16-bit resolution. The maximum size of the fraction is FFFFh or $(2^{16} - 1)/2^{16} \times t_{4\text{MHz}}$ .
E7h	T1Int	15-bit fixed-point integer value of the time taken to discharge the timing capacitor through the RTD connected to the T1 device pin. This integer portion is a binary representation of the number of $t_{4\text{MHz}}$ periods that contribute to the time results. The maximum size of the integer is 7FFFh or $(2^{15} - 1) \times t_{4\text{MHz}}$ .
E8h	T1Frac	16-bit fractional value of the time taken to charge the timing capacitor through the RTD connected to the T1 device pin. This fractional portion is a binary representation of one $t_{4\text{MHz}}$ period quantized to a 16-bit resolution. The maximum size of the fraction is FFFFh or $(2^{16} - 1)/2^{16} \times t_{4\text{MHz}}$ .
E9h	T2Int	15-bit fixed-point integer value of the time taken to charge the timing capacitor through the RTD connected to the T2 device pin. This integer portion is a binary representation of the number of periods that contribute to the time results. The maximum size of the integer is 7FFFh or $(2^{15} - 1) \times t_{4\text{MHz}}$ .
EAh	T2Frac	16-bit fractional value of the time taken to charge the timing capacitor through the RTD connected to the T2 device pin. This fractional portion is a binary representation of one $t_{4\text{MHz}}$ period quantized to a 16-bit resolution. The maximum size of the fraction is FFFFh or $(2^{16} - 1)/2^{16} \times t_{4\text{MHz}}$ .

Table 19. Conversion Results Registers Description (continued)

READ ONLY ADDRESS	NAME	DESCRIPTION
EBh	T3Int	15-bit fixed-point integer value of the time taken to charge the timing capacitor through the RTD connected to the T3 device pin. This integer portion is a binary representation of the number of $t_{4\text{MHz}}$ periods that contribute to the time results. The maximum size of the integer is 7FFFh or $(2^{15} - 1) \times t_{4\text{MHz}}$ .
ECh	T3Frac	16-bit fractional value of the time taken to charge the timing capacitor through the RTD connected to the T3 device pin. This fractional portion is a binary representation of one $t_{4\text{MHz}}$ period quantized to a 16-bit resolution. The maximum size of the fraction is FFFFh or $(2^{16} - 1)/2^{16} \times t_{4\text{MHz}}$ .
EDh	T4Int	15-bit fixed-point integer value of the time taken to charge the timing capacitor through the RTD connected to the T4 device pin. This integer portion is a binary representation of the number of $t_{4\text{MHz}}$ periods that contribute to the time results. The maximum size of the integer is 7FFFh or $(2^{15} - 1) \times t_{4\text{MHz}}$ .
EEh	T4Frac	16-bit fractional value of the time taken to charge the timing capacitor through the RTD connected to the T4 device pin. This fractional portion is a binary representation of one $t_{4\text{MHz}}$ period quantized to a 16-bit resolution. The maximum size of the fraction is FFFFh or $(2^{16} - 1)/2^{16} \times t_{4\text{MHz}}$ .
F8h	Calibration Int	15-bit fixed-point integer value of the time taken to measure the period of the 32.768kHz crystal oscillator during execution of the calibrate command. This integer portion is a binary representation of the number of $t_{4\text{MHz}}$ periods that contribute to the time results. The maximum size of the integer is 7FFFh or $(2^{15} - 1) \times t_{4\text{MHz}}$ .
F9h	Calibration Frac	16-bit fractional value of the time taken to measure the period of the 32.768kHz crystal oscillator during execution of the calibrate command. This fractional portion is a binary representation of one $t_{4\text{MHz}}$ period quantized to a 16-bit resolution. The maximum size of the fraction is FFFFh or $(2^{16} - 1)/2^{16} \times t_{4\text{MHz}}$ .

Компания «Life Electronics» занимается поставками электронных компонентов импортного и отечественного производства от производителей и со складов крупных дистрибьюторов Европы, Америки и Азии.

С конца 2013 года компания активно расширяет линейку поставок компонентов по направлению коаксиальный кабель, кварцевые генераторы и конденсаторы (керамические, пленочные, электролитические), за счёт заключения дистрибьюторских договоров

Мы предлагаем:

- Конкурентоспособные цены и скидки постоянным клиентам.
- Специальные условия для постоянных клиентов.
- Подбор аналогов.
- Поставку компонентов в любых объемах, удовлетворяющих вашим потребностям.
- Приемлемые сроки поставки, возможна ускоренная поставка.
- Доставку товара в любую точку России и стран СНГ.
- Комплексную поставку.
- Работу по проектам и поставку образцов.
- Формирование склада под заказчика.
- Сертификаты соответствия на поставляемую продукцию (по желанию клиента).
- Тестирование поставляемой продукции.
- Поставку компонентов, требующих военную и космическую приемку.
- Входной контроль качества.
- Наличие сертификата ISO.

В составе нашей компании организован Конструкторский отдел, призванный помогать разработчикам, и инженерам.

Конструкторский отдел помогает осуществить:

- Регистрацию проекта у производителя компонентов.
- Техническую поддержку проекта.
- Защиту от снятия компонента с производства.
- Оценку стоимости проекта по компонентам.
- Изготовление тестовой платы монтаж и пусконаладочные работы.
