APPLICATION NOTES

1. Typical Application Circuits

To protect the LED(s), you could connect a PTC to input of all channels as shown in application circuit.
 Note: Negative output terminal should not connected to GND. Module may be damaged.

2. Digital Dimming Control

Formula for output current:

$$I_{o,set} = \frac{(DT-0.8)}{T} I_{o,norm}$$

$I_{o,set}$ refers to the expected output current value.
 $I_{o,norm}$ refers to the rated output current
 D refers to the pulse width of the PWM signal
 T refers to the cycle of the PWM signal

Note: This formula is only supplied as a reference and the output current may be deviated from for different load conditions. The Ton(min) of PWM signal must be greater than 0.8ms, otherwise the driver cannot be operated normally. It is natural for the driver to generate audible noise during dimming process because the frequency of the control circuit is within human audible range (20Hz~20kHz). In order to make the LED flashes not visible to human eye, the PWM dimming frequency is recommended to be set above 100Hz. PWM curve (Vin=24 V, 5 LEDs)
