

# Adding a Real Time Clock to Raspberry Pi Created by lady ada

Last updated on 2019-05-19 07:22:10 AM UTC

#### Overview

This tutorial requires a Raspberry Pi running a kernel with the RTC module and DS1307 module included Current Raspbian distros have this, but others may not!

The Raspberry Pi is designed to be an ultra-low cost computer, so a lot of things we are used to on a computer have been left out. For example, your laptop and computer have a little coin-battery-powered 'Real Time Clock' (RTC) module, which keeps time even when the power is off, or the battery removed. To keep costs low and the size small, an RTC is not included with the Raspberry Pi. Instead, the Pi is intended to be connected to the Internet via Ethernet or WiFi, updating the time automatically from the global **ntp** (nework time protocol) servers

For stand-alone projects with no network connection, you will not be able to keep the time when the power goes out. So in this project we will show you how to add a low cost battery-backed RTC to your Pi to keep time!

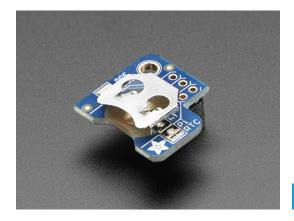

## Wiring the RTC

To keep costs low, the Raspberry Pi does not include a Real Time Clock module. Instead, users are expected to have it always connected to WiFi or Ethernet and keep time by checking the network. Since we want to include an external module, we'll have to wire one up.

We have three different RTC we suggest, PCF8523 is inexpensive, DS1307 is most common, and DS3231 is most precise. Any of them will do!

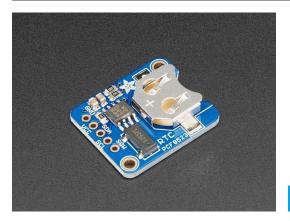

While the DS1307 is historically the most common, its not the best RTC chipset, we've found!

Adafruit PiRTC - PCF8523 Real Time Clock for Raspberry Pi

\$5.95 IN STOCK

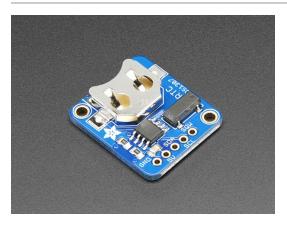

ADD TO CART

Adafruit PCF8523 Real Time Clock Assembled Breakout Board

ADD TO CART

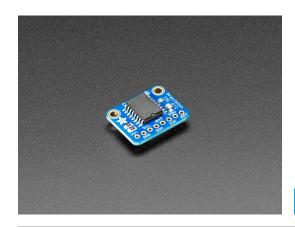

Adafruit DS1307 Real Time Clock Assembled Breakout Board

\$7.50

ADD TO CART

#### Adafruit DS3231 Precision RTC Breakout

\$13.95

ADD TO CART

Don't forget to also install a CR1220 coin cell. In particular the DS1307 wont work at all without it and none of the RTCs will keep time when the Pi is off and no coin battery is in place.

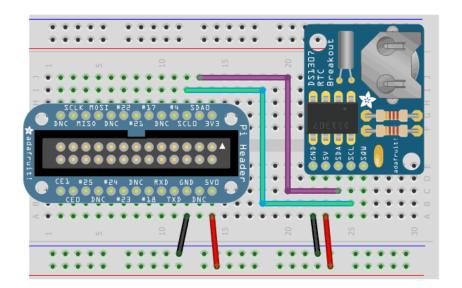

CR1220 12mm Diameter - 3V Lithium Coin Cell Battery

\$0.95

ADD TO CART

#### Wiring is simple:

- Connect VCC on the breakout board to the 5.0V pin of the Pi (if using DS1307)
   Connect VCC on the breakout board to the 3.3V pin of the Pi (if using PCF8523 or DS3231)
- 2. Connect GND on the breakout board to the GND pin of the Pi
- 3. Connect SDA on the breakout board to the SDA pin of the Pi
- 4. Connect SCL on the breakout board to the SCL pin of the Pi

## Set Up & Test I2C

## Set up I2C on your Pi

You'll also need to set up i2c on your Pi, to do so, run sudo raspi-config and under Advanced select I2C and turn it on.

For more details, check out our tutorial on Raspberry Pi i2c setup and testing athttp://learn.adafruit.com/adafruits-raspberry-pi-lesson-4-gpio-setup/configuring-i2c (https://adafru.it/aTI)

Reboot once you've done that with sudo reboot

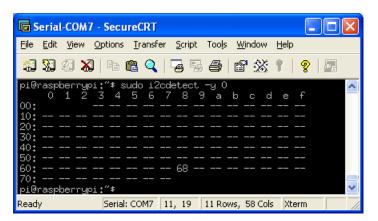

### Verify Wiring (I2C scan)

Verify your wiring by running

#### sudo apt-get install python-smbus i2c-tools

to install the helper software and then **sudo i2cdetect -y 1** at the command line, you should see ID #68 show up - that's the address of the DS1307, PCF8523 or DS3231!

If you have a much older Pi 1, you will have to run sudo i2cdetect -y 0 as the I2C bus address changed from 0 to 1

Once you have the Kernel driver running, i2cdetect will skip over 0x68 and display UU instead, this means its working!

### Set RTC Time

Now that we have the module wired up and verified that you can see the module with i2cdetect, we can set up the module

Don't forget to set up I2C in the previous step

## Raspbian Jessie (Systemd)

Thanks to kd8twg for the hints! (https://adafru.it/ne3)

You can add support for the RTC by adding a device tree overlay. Run

#### sudo nano /boot/config.txt

to edit the pi configuration and add whichever matches your RTC chip:

dtoverlay=i2c-rtc,ds1307

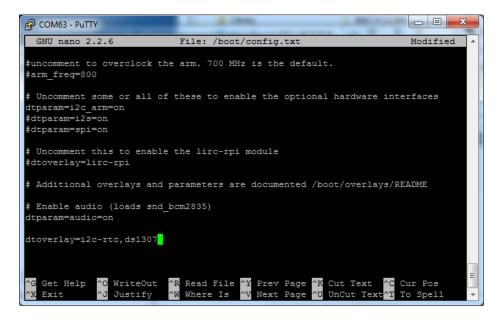

or

dtoverlay=i2c-rtc,pcf8523

or

dtoverlay=i2c-rtc,ds3231

to the end of the file

Save it and run **sudo reboot** to start again. Log in and run **sudo i2cdetect -y 1** to see the UU show up where 0x68 should be

Disable the "fake hwclock" which interferes with the 'real' hwclock

- sudo apt-get -y remove fake-hwclock
- sudo update-rc.d -f fake-hwclock remove
- sudo systemctl disable fake-hwclock

```
pi@raspberrypi:~ $ sudo apt-get remove fake-hwclock
Reading package lists... Done
Building dependency tree
Reading state information... Done
The following packages will be REMOVED:
    fake-hwclock
0 upgraded, 0 newly installed, 1 to remove and 0 not upgraded.
After this operation, 74.8 kB disk space will be freed.
Do you want to continue? [Y/n] Y
(Reading database ... 31239 files and directories currently installed.)
Removing fake-hwclock (0.9) ...
Processing triggers for man-db (2.7.0.2-5) ...
pi@raspberrypi:~ $ sudo update-rc.d -f fake-hwclock remove
```

Now with the fake-hw clock off, you can start the original 'hardware clock' script.

Run sudo nano /lib/udev/hwclock-set and comment out these three lines:

```
#if [ -e /run/systemd/system ]; then
# exit 0
#fi
```

```
PuTTY COM76 - PuTTY
 GNU nano 2.2.6
                          File: /lib/udev/hwclock-set
# Reset the System Clock to UTC if the hardware clock from which it
 was copied by the kernel was in localtime.
#if [ -e /run/systemd/system ] ; then
if [ -e /run/udev/hwclock-set ]; then
    exit 0
    -f /etc/default/rcS ] ; then
    . /etc/default/rcS
# These defaults are user-overridable in /etc/default/hwclock
                               [ Read 37 lines ]
  Get Help
                WriteOut
                             Read File
                                          Prev Page
                                                       Cut Text
                                                                 ^C Cur Pos
                Justify
                             Where Is
                                          Next Page
                                                       UnCut Text^T
                                                                    To Spell
```

Also comment out the two lines

```
/sbin/hwclock --rtc=$dev --systz --badyear
```

and

/sbin/hwclock --rtc=\$dev --systz

```
# /sbin/hwclock --rtc=$dev --systz --badyear
/sbin/hwclock --rtc=$dev --hctosys --badyear
else
/sbin/hwclock --rtc=$dev --systz
/sbin/hwclock --rtc=$dev --hctosys
fi

# Note 'touch' may not be available in initramfs
> /run/udev/hwclock-set
```

#### Sync time from Pi to RTC

When you first plug in the RTC module, it's going to have the wrong time because it has to be set once. You can always read the time directly from the RTC with sudo hwclock -D -r

```
_ O X
PuTTY COM76 - PuTTY
pi@raspberrypi:~$ sudo hwclock -D -r
hwclock from util-linux 2.25.2
Using the /dev interface to the clock.
Last drift adjustment done at 1476489224 seconds after 1969
Last calibration done at 1476489224 seconds after 1969
Hardware clock is on UTC time
Assuming hardware clock is kept in UTC time.
Waiting for clock tick ...
dev/rtc does not have interrupt functions. Waiting in loop for time from /dev/r/
tc to change
Time read from Hardware Clock: 2084/05/28 02:30:47
Invalid values in hardware clock: 2084/05/28 02:30:47
nwclock: The Hardware Clock registers contain values that are either invalid
g. 50th day of month) or beyond the range we can handle (e.g. Year 2095).
oi@raspberrypi:~$
```

You can see, the date at first is invalid! You can set the correct time easily. First run date to verify the time is correct. Plug in Ethernet or WiFi to let the Pi sync the right time from the Internet. Once that's done, run **sudo hwclock -w** to write the time, and another **sudo hwclock -r** to read the time

```
pi@raspberrypi:~$ date
Fri 14 Oct 23:56:25 UTC 2016
pi@raspberrypi:~$ sudo hwclock -w
pi@raspberrypi:~$ sudo hwclock -r
Fri 14 Oct 2016 23:56:32 UTC -0.655765 seconds
pi@raspberrypi:~$
```

Once the time is set, make sure the coin cell battery is inserted so that the time is saved. You only have to set the time once

That's it! Next time you boot the time will automatically be synced from the RTC module

## Raspbian Wheezy or other pre-systemd Linux

First, load up the RTC module by running

sudo modprobe i2c-bcm2708 sudo modprobe i2c-dev sudo modprobe rtc-ds1307

Then, as root (type in sudo bash) run

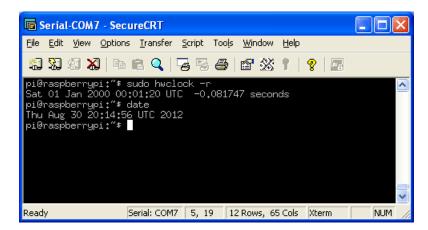

echo ds1307 0x68 > /sys/class/i2c-adapter/i2c-1/new\_device

If you happen to have an old Rev 1 Pi, type in

echo ds1307 0x68 > /sys/class/i2c-adapter/i2c-0/new device

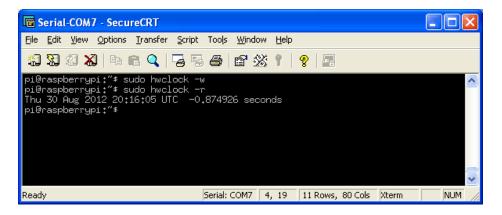

You can then type in exit to drop out of the root shell.

Then check the time with **sudo hwclock -r** which will read the time from the DS1307 module. If this is the first time the module has been used, it will report back Jan 1 2000, and you'll need to set the time

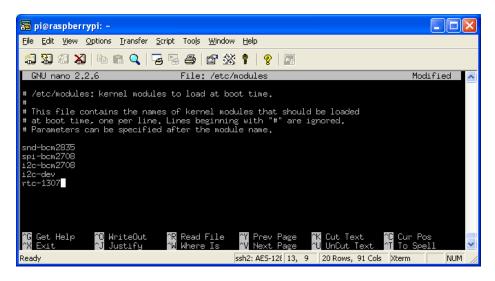

First you'll need to get the right time set on the Pi, the easiest way is to connect it up to Ethernet or Wifi - it will automatically set the time from the network. Once the time is correct (check with the date command), run sudo hwclock -w to write the system time to the RTC

You can then verify it with sudo hwclock -r

Next, you'll want to add the RTC kernel module to the /etc/modules list, so its loaded when the machine boots. Run sudo nano /etc/modules and add rtc-ds1307 at the end of the file (the image below says rtc-1307 but its a typo)

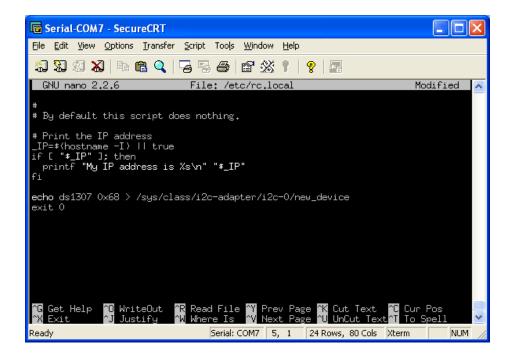

Older pre-Jessie raspbian is a little different. First up, you'll want to create the DS1307 device creation at boot, edit /etc/rc.local by running

sudo nano /etc/rc.local

and add:

```
echo ds1307 0x68 > /sys/class/i2c-adapter/i2c-0/new_device (for v1 raspberry pi) echo ds1307 0x68 > /sys/class/i2c-adapter/i2c-1/new_device (for v2 raspberry pi) sudo hwclock -s (both versions)
```

before exit 0 (we forgot the hwclock -s part in the screenshot below)

That's it! Next time you boot the time will automatically be synced from the RTC module

OOO «ЛайфЭлектроникс" "LifeElectronics" LLC

ИНН 7805602321 КПП 780501001 P/C 40702810122510004610 ФАКБ "АБСОЛЮТ БАНК" (ЗАО) в г.Санкт-Петербурге К/С 3010181090000000703 БИК 044030703

Компания «Life Electronics» занимается поставками электронных компонентов импортного и отечественного производства от производителей и со складов крупных дистрибьюторов Европы, Америки и Азии.

С конца 2013 года компания активно расширяет линейку поставок компонентов по направлению коаксиальный кабель, кварцевые генераторы и конденсаторы (керамические, пленочные, электролитические), за счёт заключения дистрибьюторских договоров

#### Мы предлагаем:

- Конкурентоспособные цены и скидки постоянным клиентам.
- Специальные условия для постоянных клиентов.
- Подбор аналогов.
- Поставку компонентов в любых объемах, удовлетворяющих вашим потребностям.
- Приемлемые сроки поставки, возможна ускоренная поставка.
- Доставку товара в любую точку России и стран СНГ.
- Комплексную поставку.
- Работу по проектам и поставку образцов.
- Формирование склада под заказчика.
- Сертификаты соответствия на поставляемую продукцию (по желанию клиента).
- Тестирование поставляемой продукции.
- Поставку компонентов, требующих военную и космическую приемку.
- Входной контроль качества.
- Наличие сертификата ISO.

В составе нашей компании организован Конструкторский отдел, призванный помогать разработчикам, и инженерам.

Конструкторский отдел помогает осуществить:

- Регистрацию проекта у производителя компонентов.
- Техническую поддержку проекта.
- Защиту от снятия компонента с производства.
- Оценку стоимости проекта по компонентам.
- Изготовление тестовой платы монтаж и пусконаладочные работы.
