**NOTES on DIF Output AC Specs: (unless otherwise noted, guaranteed by design and characterization, not 100% tested in production).**

- <sup>1</sup>Measurement taken for single ended waveform on a component test board (not in system)
- <sup>2</sup>Measurement taken from differential waveform on a component test board. (not in system)
- <sup>3</sup>Slew rate emasured through V\_swing voltage range centered about differential zero
- <sup>4</sup>Vcross is defined at the voltage where Clock = Clock#, measured on a component test board (not in system)
- <sup>5</sup>Only applies to the differential rising edge (Clock rising, Clock# falling)
- <sup>6</sup>Total distributed intentional SRC to SRC skew. PCIe Gen2 outputs (SRC3, 4, 6 and 7) will have 0 nominal skew. Maximum allowable interpair skew is 150 ps.
- <sup>7</sup>The max voltage including overshoot.
- <sup>8</sup>The min voltage including undershoot.
- <sup>9</sup>The total variation of all Vcross measurements in any particular system. Note this is a subset of V\_cross min/mas (V\_Cross absolute) allowed. The intent is to limit Vcross induced modulation by setting C\_cross\_delta to be smaller than V\_Cross absolute.
- <sup>10</sup>Matching applies to rising edge rate for Clock and falling edge rate for Clock#. It is measured using a +/-75mV window centered on the average cross point where Clock rising meets Clock# falling. The median cross point is used to calculate the voltage thresholds the oscilloscope is to use for the edge rate calculations.
- <sup>11</sup>For PCIe Gen2 compliant devices, SRC 3, 4, 6, and 7 will have 0 ps nominal skew.

| DOT Jitter - Cycle to Cycle | DOTJC2C | Differential Measurement |     | 250 | ps    | 1     |

**NOTES on DIF Output Jitter: (unless otherwise noted, guaranteed by design and characterization, not 100% tested in production).**

- <sup>1</sup>Jitter specs are specified as measured on a clock characterization board. System designers need to take special care not to use these numbers, as the in-system performance will be somewhat degraded. The receiver EMTS (chispet or CPU) will have the receiver jitter specs as measured in a real system.
- <sup>2</sup>Phase jitter requirement: The designated Ge2 outputs will meet the reference clock jitter requirements from the PCI Express Gen2 Base Spec. The test is performed on a component test board under quiet conditions with all outputs on. Jitter analysis is performed using the standardized tool provided by the PCI SIG.
