## APPLICATION CIRCUIT

Note: No DC blocking capacitors are required on all RF ports, unless DC is biased externally.

- \* The Inductor L1 is required for enhancing ESD protection level.  
The inductor L1 is recommended in order to keep the DC bias level of each RF port at 0 V level tightly.

## PRECAUTIONS

- [1] No DC blocking capacitors are required at each RF port normally. When the other device is biased at certain voltage and connected to the NJG1681MD7, a DC block capacitor is required between the device and the switch IC. This is because the each RF port of NJG1681MD7 is biased at 0 V (GND).
- [2] For avoiding the degradation of RF performance, the bypass capacitor (C1) should be placed as close as possible to VDD terminal
- [3] For good RF performance, all GND terminals are must be connected to PCB ground plane of substrate, and through - holes for GND should be placed the IC near.
