0019-02-08-01-000 B1010SP0-EVB-1 Bluetooth[®] Smart Evaluation Board User Guide

INTRODUCTION

Document No: 0019-02-08-01-000 (issue B)

CEL's Bluetooth Smart Evaluation Board is a simple yet comprehensive way for designers to develop Bluetooth Smart applications using CSR's µEnergy[®] solution. B1010SP0-EVB-1 is based on CSR's µEnergy Starter Development Kit, but has been populated with a CEL B1010SP0 Mini Module. For more information on the CEL B1010SP0 Mini Modules, please visit <u>http://meshconnect.cel.com/B1010</u>.

B1010SP0-EVB-1 is designed to be used in conjunction with CSR's µEnergy platform for software development, and is a complete development environment for rapid prototyping of Bluetooth Smart products. It provides access to CSR's µEnergy and CSRmesh[®] stacks for developing interoperable BLE 4.x and CSRmesh-based designs, including:

- Software Development Kit (SDK)
- Example embedded applications for popular Bluetooth Smart and CSRmesh profiles
- Example host applications for iOS and Android
- xIDE for µEnergy (includes compiler)
- Production test and configuration tools

This User Guide describes the kit contents, SDK installation, and running the first application for both the µEnergy and CSRmesh SDKs, used for BLE and CSRmesh applications, respectively.

KIT CONTENTS

The following components are included in B1010SP0-EVB-1:

1. Target Board:

Figure 1 - Evaluation Kit Target Board

For proper operation of the B1010SP0 Mini Module, ensure that the VDD_PADS, SPI_ENABLE, and VDD_BAT jumpers are installed as shown in Figure 1.

2. A Mini-USB cable to connect the target board to the development PC:

Figure 2 - Mini-USB Cable

3. Card with website link to view/download the documentation.

SOFTWARE INSTALLATION

The following steps are required to complete the CSR µEnergy SDK setup:

1. Obtain the activation code for the kit. This is printed on a label on the side of the kit box, and looks similar to Figure 3. For more information, visit https://wiki.csr.com/wiki/Activation_Codes.

Serial Number	SN: 29144 BDA: 002:5B:03F377
Activation Code	Activation Code: 1234-ABCD-5678-EFGH

Figure 3 - B1010SP0-EVB-1 Activation Code

Register your kit at <u>http://www.csrsupport.com</u> using the activation code to create a CSR Support account. For more information, visit <u>https://wiki.csr.com/wiki/CSR_Support_Registration</u>.

3. Once you have approved the terms and conditions and ECA agreement been approved for access you will be able to login the CSR Support.

Note: Please make sure you use your company email address or you may be required to change your email address to gain access. This is done through your account setting which will require an additional email be sent to your email address to be verified for access requests.

Once authorized, it is possible to download the uEnergy SDK from CSRsupport with the CSRmesh level of access.

For access to CSRmesh SDK, click on the link highlighted below in green (at <u>https://wiki.csr.com/wiki/Main_Page</u>) and enter activation code following steps at <u>https://wiki.csr.com/wiki/Activation_Codes</u>

Figure 5 – uEnergy SDK and CSRMesh SDK

 Once you have successfully created a CSR Support account, download and install the latest version of the μEnergy SDK (for BLE applications) or the CSRmesh SDK (for CSRmesh applications) from <u>http://www.csrsupport.com</u>. The default configuration options are recommended during the installation process.

Note: always install the software before plugging in the hardware.

To continue with the µEnergy SDK, please see the section below called "Connecting the Hardware: µEnergy SDK".

To continue with the CSRmesh SDK, please see the section later in this document called "Connecting the Hardware: CSRmesh SDK".

Figure 6 - CSR µEnergy SDK Installer

CONNECTING THE HARDWARE: µENERGY SDK

- 1. Remove the target board from the anti-static packaging.
- 2. Connect the mini-USB cable to the target board USB port and connect the other end of the cable to a free USB port on the development PC. The device drivers necessary to connect to the target board are automatically installed on the PC.

Figure 7 - Evaluation Kit Target Board Showing USB Port Location

RUNNING THE FIRST APPLICATION: µENERGY SDK

1. Launch xIDE by clicking on the xIDE shortcut on the desktop or navigating to it using the Windows Start Menu.

Figure 9 - xIDE Window

2. Open the Heart Rate project by clicking on "Project" in the menu bar and selecting "Open Workspace". Navigate to the SDK installation folder. If the default installation path was chosen, this will be C:\CSR_uEnergy_SDK-x.x.x.\apps\hr_sensor.

Figure 10 - Default Location of hr_sensor Project

3. Some of the default settings need to be customized for your particular evaluation kit, including:

- a. Bluetooth Address
- b. Crystal Trim
- c. Device Name

The Bluetooth Address and Crystal Trim need to match the values printed on the target board label.

Figure 11 - Example Target Board Label

4. Open the hr_sensor_cs101x_A05.keyr file in the SDK and change the values &BDADDR and &CRYSTAL_FTRIM to match the label.

Figure 12 - Location of Bluetooth Address and Crystal Trim Values to be Modified

5. For the Bluetooth Address, the Endian format of the value on the label must be converted as shown below.

>DECIMAL_(CS_VERSION=78
// (0001)	- Bluetooth device address
&BDADDR =	F14C 5b03 0002

Figure 13 - Example Bluetooth Address Conversion

6. For the Crystal Trim value, the decimal value on the label must be converted to hexadecimal as shown below.

Figure 14 - Example Crystal Trim Value Conversion

7. To customize the Device Name, search for the declaration g_device_name in gap_service.c within the SDK.

Figure 15 - Location of Device Name Value to be Modified

8. Replace the word "Sensor" with the serial number on the label.

 Compile the Heart Rate application by clicking on Build in the SDK menu bar. Select Build Active Project or press F7 shortcut key. This will build all of the files included in the active project in the current workspace using the selected configuration into an application image for the Target board.

The build is incremental, so the minimum set of builds are performed in order to reflect changes to source files and configurations. The Target board must remain connected during compilation.

If a compilation error is found it will be displayed here Figure 17 - Successfully Built Project

10. Download the application to the hardware by selecting **Run** from the **Debug** menu or press the **F5** shortcut key. The Heart Rate application will now be running on the hardware.

Note that it will stop advertising after a few minutes so will not be visible to any searching phones. To re-enable advertisements, the button can be connected to PIO11 with a jumper (not supplied) or the eval board can be power cycled.

For more information on the heart rate application, see the *Heart Rate Sensor Application Note* installed with the SDK. If the default installation path was chosen, this will be located at C:\CSR_uEnergy_SDK-2.4.5.13\apps\hr_sensor\CS-227117-AN_CSRuEnergyHeartRateSensorApplicationNote.pdf

USING B1010SP0-EVB-1 UART DEBUG PORT

The B1010SP0-EVB-1 does not include a 3.3V level shifter required to connect to a computer's USB or RS232 interface. CEL recommends purchasing an external 3.3V to USB level shifter.

For more information about debugging please see the debug module of the xIDE. It's located under the Navigator window by selecting *Help Documents -> Firmware Library*, select the *Modules* tab and scroll to the bottom and select the *Debug* module. The Debug module contains a number of functions to allow an application to send basic text strings across the UART, primarily for sending debugging messages to a serial terminal.

COMPANION PHONE APPS: µENERGY SDK

Reported pulse information from the Heart Rate application can be viewed with an iOS or Android phone. Visit the "Mobile Applications" section at <u>http://wiki.csr.com</u> for information on downloading the example apps.

Figure 18 - CSR Profile Demonstrator App for iOS

Figure 5 - Heart Rate App for Android

CONNECTING THE HARDWARE: CSRMESH SDK

This section follows the "Software Installation" section (earlier in this document) for users developing with the CSRmesh SDK.

- 1. Remove the target board from the anti-static packaging.
- 2. Connect the mini-USB cable to the target board USB port and connect the other end of the cable to a free USB port on the development PC. The device drivers necessary to connect to the target board are automatically installed on the PC.
- 3. Connect a jumper wire (not supplied) between J101 pin 14 (PIO10) and the LED control pin as shown in the figure below. This wire will be used to control the LED.

Figure 20 - Evaluation Kit Target Board Showing USB Port Location & Jumper Wire

RUNNING THE FIRST APPLICATION: CSRMESH SDK

1. Launch xIDE by clicking on the xIDE shortcut on the desktop or navigating to it using the Windows Start Menu.

Figure 22 - xIDE Window

 Open the Light Control project by clicking on "Project" in the menu bar and selecting "Open Workspace". Navigate to the SDK installation folder. If the default installation path was chosen, this will be C:\CSR_uEnergy_CSRmesh\applications\CSRmeshLight.

The Light Control application allows a Bluetooth Smart-enabled phone to send and receive CSRmesh commands and enables the user to control the LED on the Target board.

Figure 23 - Default Location of CSRmeshLight Project

 Compile the Light Control application by clicking on Build in the SDK menu bar. Select Build Active Project or press F7 shortcut key. This will build all of the files included in the active project in the current workspace using the selected configuration into an application image for the Target board.

The build is incremental, so the minimum set of builds are performed in order to reflect changes to source files and configurations. The Target board must remain connected during compilation.

4. Download the application to the hardware by selecting **Run** from the **Debug** menu or press the **F5** shortcut key. The Light Control application will now be running on the hardware.

For more information on the Light Control application, see the *CSRmesh Light Application Note* available for download from the CSR Support website.

If desired, add additional B1010SP0-EVB-1 eval boards to the setup, following the same steps listed above. The eval boards will automatically mesh.

COMPANION PHONE APPS: CSRMESH SDK

The Target board LED can be controlled via a companion Android or iOS app. The apps can be downloaded from the CSR mesh portion of the CSR Support website. This section will describe the operation of the Android app.

The app will connect to a CSRmesh device. The device acts as a bridge from the phone app to the rest of the CSRmesh network.

- 1. When the app is launched, the initial screen shown below is displayed.
- 2. Tap on "Device Association" to search for devices that support CSRmesh.
- 3. Tap a discovered device to connect to it.
- 4. The app may ask you for a network passphrase. Enter any suitable passphrase to be used by all your trusted devices. Select the check box "Authorise Devices" <u>only</u> if you wish to use optional device authentication and know the short codes (private keys) for each of your end devices.
- 5. To control the Target board LED, select the Light Control menu option. Tap on the red portion of the color wheel and switch the control to "On". You should see the Target board LED toggle off/on as you tap between "Off" and "On".

Note: The app was designed to be used with a tri-color LED, while this eval board only has a single-color red LED, so ensure that the red region on the color wheel is selected. Also, the dimming feature of the app is not supported.

NEXT STEPS

For the µEnergy SDK, CSR provides application notes for many different BLE example applications, including an Alert Tag, Blood Glucose Sensor, Blood Pressure Sensor, Keyboard, Mouse, etc. Visit the "Example Applications" section at http://wiki.csr.com for a complete list.

For the CSRmesh SDK, CSR provides application notes for many different CSRmesh example applications, including a Switch, Heater, Temperature Sensor, etc. Visit the CSRmesh portion of the CSR Support website for a complete list.

REFERENCE: MEASURING CURRENT ON B1010SP0-EVB-1

To measure the total current consumed by the CEL module, a precision digital multi-meter can be used in place of the VDD_BAT jumper. This measures all of the current flowing to the module.

In order to measure the correct current, it is also necessary to temporarily remove the SPI_ENABLE jumper on the module. This is because in SPI mode the module has a $47k\Omega$ pull-down resistor that is pulled high. See the figure below for the location of the VDD_BAT and SPI_ENABLE jumpers.

Figure 26 - SPI_ENABLE, VDD_BAT, BATT/USB Jumper Settings

REFERENCE: BATTERY OPERATION

The Target board can be powered from a CR2032 3V Lithium Ion battery (not supplied). It should be fitted to the battery holder with the positive (+) side upwards.

When the battery is in use, the BATT/USB jumper should be moved to the BATT position. The location of this jumper is shown in the above figure.

REFERENCE: J101 AND J102 HEADER PINOUTS

The following tables describe the breakout connections J101 and J102 (MOD2 connections) and are intended to show where the corresponding J101 and J102 pins can be used to make a connection to the CEL B1010SP0. CSR1010 IC pin information is also included below.

TECHNICAL ASSISTANCE

For Technical Assistance, visit http://www.cel.com/MeshConnectHelp

ООО "ЛайфЭлектроникс"

ИНН 7805602321 КПП 780501001 Р/С 40702810122510004610 ФАКБ "АБСОЛЮТ БАНК" (ЗАО) в г.Санкт-Петербурге К/С 3010181090000000703 БИК 044030703

Компания «Life Electronics» занимается поставками электронных компонентов импортного и отечественного производства от производителей и со складов крупных дистрибьюторов Европы, Америки и Азии.

С конца 2013 года компания активно расширяет линейку поставок компонентов по направлению коаксиальный кабель, кварцевые генераторы и конденсаторы (керамические, пленочные, электролитические), за счёт заключения дистрибьюторских договоров

Мы предлагаем:

- Конкурентоспособные цены и скидки постоянным клиентам.
- Специальные условия для постоянных клиентов.
- Подбор аналогов.
- Поставку компонентов в любых объемах, удовлетворяющих вашим потребностям.
- Приемлемые сроки поставки, возможна ускоренная поставка.
- Доставку товара в любую точку России и стран СНГ.
- Комплексную поставку.
- Работу по проектам и поставку образцов.
- Формирование склада под заказчика.
- Сертификаты соответствия на поставляемую продукцию (по желанию клиента).
- Тестирование поставляемой продукции.
- Поставку компонентов, требующих военную и космическую приемку.
- Входной контроль качества.
- Наличие сертификата ISO.

В составе нашей компании организован Конструкторский отдел, призванный помогать разработчикам, и инженерам.

Конструкторский отдел помогает осуществить:

- Регистрацию проекта у производителя компонентов.
- Техническую поддержку проекта.
- Защиту от снятия компонента с производства.
- Оценку стоимости проекта по компонентам.
- Изготовление тестовой платы монтаж и пусконаладочные работы.
