

# 1 Watt Surface Mount Zener Diodes

Qualified per MIL-PRF-19500/115

Qualified Levels:  
JAN, JANTX, and JANTXV

## DESCRIPTION

This surface mountable Zener diode series is similar to the 1N3016B-1 through 1N3045B-1 JEDEC registration in the DO-13 package except that it meets the surface mount DO-213AB outline. It is an ideal selection for applications of high density and low parasitic requirements. Due to its glass hermetic seal qualities and metallurgically enhanced internal construction, it is also well suited for high-reliability applications where it is available in JAN, JANTX, and JANTXV military qualifications. Lower voltages are also available in the 1N3821AUR-1 through 1N3828AUR-1 series (3.3 V to 7.5 V) in the same package (see separate data sheet).

**Important:** For the latest information, visit our website <http://www.microsemi.com>.

## FEATURES

- Leadless surface mount equivalents to the JEDEC registered 1N3016 through 1N3045 number series.
- Zener voltage range: 6.8 volts to 110 volts.
- Hermetically sealed, double plug glass construction.
- Metallurgically bonded.
- Voltage tolerances of 5%, 2%, and 1% available.
- JAN, JANTX, and JANTXV qualifications also available per MIL-PRF-19500/115. (See [part nomenclature](#) for all available options.)
- RoHS compliant versions available (commercial grade only).

## APPLICATIONS / BENEFITS

- Regulates voltage over a broad operating current and temperature range.
- Wide selection from 6.8 to 110 V.
- Low reverse (leakage) currents.
- Leadless package for surface mounting.
- Ideal for high-density situations.
- Metallurgically enhanced internal contact design for greater reliability and lower thermal resistance.
- Non-sensitive to ESD.
- Inherently radiation hard as described in Microsemi "[MicroNote 050](#)".

- NOTES:**
1. Zener voltage ( $V_Z$ ) is measured with junction in thermal equilibrium with still air at a temperature of 25 °C. The test currents ( $I_{ZT}$ ) at nominal voltages provide a constant 0.25 watts.
  2. The Zener impedance is derived when a 60 cycle ac current having an rms value equal to 10% of the dc Zener current ( $I_{ZT}$  or  $I_{ZK}$ ) is superimposed on  $I_{ZT}$  or  $I_{ZK}$ . Zener impedance is measured at 2 points to ensure a sharp knee on the breakdown curve and to eliminate unstable units. See [MicroNote 202](#) for variation in dynamic impedance with different Zener currents.
  3. These values of  $I_{ZM}$  may often be exceeded in the case of individual diodes. The values shown are calculated for a unit at the high voltage end of its tolerance range. Allowance has also been made for the rise in Zener voltage above  $V_{ZT}$  that results from Zener impedance and the increase in junction temperature as a unit approaches thermal equilibrium at a dissipation of 1 watt. The  $I_{ZM}$  values shown for +/- 5% tolerance units may be used with little error for +/- 10% tolerance units, but should be reduced by 7% to include a +/- 20% tolerance unit near the high voltage end of its tolerance range.
